Supervisors and examiners should review the substance of secondary-market transactions when assessing underlying risk exposures. For example, partial, first-loss direct-credit substitutes providing credit protection to a securitization transaction can, in substance, involve much the same credit risk as that involved in holding the entire asset pool on the institution's balance sheet. Supervisors and examiners should ensure that banking organizations have implemented reasonable methods for allocating capital against the economic substance of credit exposures arising from early-amortization events and liquidity facilities associated with securitized transactions since such facilities are usually structured as short-term commitments to avoid a risk-based capital requirement, even though the inherent credit risk may be approaching that of a guarantee.[9]

If, in the supervisor's judgment, an institution's capital level is not sufficient to provide protection against potential losses from such credit exposures, this deficiency should be reflected in the banking organization's CAMELS or BOPEC ratings. Furthermore, supervisors and examiners should discuss the capital deficiency with the institution's management and, if necessary, its board of directors. Such an institution will be expected to develop and implement a plan for strengthening the organization's overall capital adequacy to levels deemed appropriate given all the risks to which it is exposed.

2129.05.7 INSPECTION OBJECTIVES

1. To determine whether there are risk-management systems and whether they accurately identify all the risk exposures stemming from secondary-market activities.
2. To evaluate secondary-market credit activities and to determine if there has been a lowering of credit standards that could deteriorate the institution's financial condition during less favorable business and economic conditions.
3. To establish whether the institution's management system performs stress testing to evaluate the risk exposures of secondary-market credit activities under various sce-

9. For further guidance on distinguishing, for risk-based capital purposes, whether a facility is a short-term commitment or a direct-credit substitute, see SR-92-11, ''Asset-Backed Commercial Paper Programs.'' Essentially, facilities that provide liquidity, but which also provide credit protection to secondary-market investors, are to be treated as direct-credit substitutes for purposes of risk-based capital.

narios and their potential effect on the institution's liquidity, earnings, and capital adequacy.
4. To review the substance of the institution's secondary-market transactions when assessing underlying risk exposures.
5. To ascertain whether liquidity contingency plans exist and to determine whether they fully incorporate the potential risk posed by secondary-market credit activities, including the need to obtain replacement funding.
6. To determine whether the board of directors is fully informed of the risks involved in secondary-market activities and whether they approve policies, controls, and procedures to control exposures arising from credit, liquidity, operational, legal, reputational, and other risks.
7. To determine whether the institution has a sufficiently strong capital position to support *all* the risk associated with secondary-market credit activities and that it has a capital plan for strenghtening its overall capital adequacy position.
8. To ascertain whether there is an effective system of internal controls—focused on lines of authority and the separation of duties—to monitor and contain the risks associated with secondary-market activities.

2129.05.8 INSPECTION PROCEDURES

1. Determine whether the institution's senior management is recognizing the risk involved in secondary-market credit activities by—
   a. determining if there is adequate identifying, quantifying, and monitoring of risk;
   b. clearly communicating the extent and depth of those risks in discussions, presentations, and inspection reports that are delivered to the board of directors and senior officials of the institution;
   c. presenting to the board of directors, for their approval, all significant policies relating to the risk management of secondary-market activities and the conditions under which a loan syndication can be purchased;
   d. determining whether management is conducting ongoing stress testing to identify potential losses and liquidity needs under adverse and "worst-case" scenarios; and
   e. making certain that senior management is setting adequate minimum internal standards for allowances or liabilities for losses, capital, and contingency funding.
2. Assess whether the institution's systems and processes adequately identify, measure, monitor, and control all of the risks involved in the institution's secondary-market credit activities.
3. Determine whether the various risks associated with secondary-market activities are incorporated into contingency plans, including replacement funding plans and identified alternative funding sources, to lessen the impact of those risks.
4. Establish whether there is an adequate and effective system of internal controls that enforces official lines of authority and the appropriate separation of duties in managing the risks associated with secondary-market activities.
5. Review loan-syndication contract agreements, underwriting documentation, and relevant correspondence with loan-syndication contractual parties to establish whether—
   a. the bank holding company's management has performed adequate credit investigations and evaluations of the syndicate loans, the syndicate participants, and the extent of the BHC's credit-risk exposures;
   b. the syndication customers are in a position to conduct their own investigations and evaluation of the credit risks involved in the transaction; and
   c. undue reliance is placed on the lead underwriter, the participants, or on their commercial-loan credit ratings.
6. For credit derivatives—
   a. analyze the credit risk associated with the reference asset, the general market risk, and the counterparty risk; and
   b. determine, for those reference assets that are not identical assets actually owned, whether the reference asset is an appropriate proxy for the loan or other assets whose credit exposure is to be offset.
7. Review the substance of secondary-market transactions when evaluating and analyzing underlying risk exposures.
8. Evaluate and determine that there are reasonable methods for internally allocating capital against the economic substance of credit exposures that arise from amortization events and liquidity facilities associated with securitized transactions.
9. Incorporate the evaluation of potential risks and losses from credit exposures, including management deficiencies, into the institution's supervisory ratings.

2130.0.1 INTRODUCTION

Effective March 1, 1983, the Board issued an amended bank holding company policy statement entitled ‘‘Futures, Forward and Options on U.S. Government and Agency Securities and Money Market Instruments.’’ Bank holding companies are now required to furnish written notification to their District Federal Reserve Banks within 10 days after financial contract activities are begun by the parent or a nonbank subsidiary. The policy is consistent with the joint policy statement previously issued by the three federal bank regulators with regard to banks participating in financial contracts, and reflects the Board’s judgment that bank holding companies, as sources of strength for their subsidiary banks, should not take speculative positions in such activities.

If a bank holding company or nonbank subsidiary is taking or intends to take positions in financial contracts, that company’s board of directors should approve written policies and establish appropriate limitations to ensure that the activity is conducted in a safe and sound manner. Also, appropriate internal control and audit procedures should be in place to monitor the activity. The following discussion and inspection procedures apply to futures contract activity generally, but are intended to focus specifically on financial futures contracts. For a discussion of currency futures and options and the examination procedures for those instruments, see sections F and G in the Merchant and Investment Bank Examination Manual.

Information, instructions, and inspection procedures have been provided for verifying compliance with the Board’s policy statement. It is intended that the policy statement will ensure that contract activities are conducted in accordance with safe and sound banking practices. The task of evaluating BHC contract activities is the responsibility of System examiners. The following information and inspection procedures are intended to serve as a guide for Federal Reserve Bank staff in that effort.

2130.0.2 DEFINITIONS

Basis—Basis is defined as the difference between the futures contract price and the cash market price of the same underlying security, money market instrument, or commodity.

Call Option—A contract that gives the buyer (holder) the right, but not the obligation to buy (call), a specified quantity of an underlying security, money market instrument or commodity at or before the stated expiration of the contract. At expiration, if the value of the option increases, the holder will exercise the option or close it at a profit. If the value of the option does not increase, the holder would probably let the option expire (or close it out at a profit) and, consequently, will lose the cost (premium paid) of (for) the option. Alternatively, the option may be sold prior to expiration.

Clearing Corporation—A corporation organized to function as the clearing house for an exchange. The clearing house registers, monitors, matches and guarantees trades on a futures market, and carries out financial settlement of futures transactions. The clearing house acts as the central counterparty to all trades executed on the exchange. It substitutes as a seller to all buyers and as a buyer to all sellers. In addition, the clearing corporation serves to insure that all contracts will be honored in the event of a counterparty default.

Clearing Member—A member firm of the clearing house or corporation. Membership in clearing associations or corporations is restricted to members of the respective commodity exchanges, but not all exchange members are clearing house members. All trades of a nonclearing member must be registered with, and eventually settled through, a clearing member.

Commodities Futures Trading Commission—The CFTC is a federal regulatory agency charged with regulation of futures trading in all commodities. It has broad regulatory authority over futures trading. It must approve all future contracts traded on U.S. commodity exchanges, ensure that the exchanges enforce their own rules (which it must review and approve), and direct an exchange to take any action needed to maintain orderly markets whenever it believes that an ‘‘emergency’’ exists.

Contract Activities—This term is used in this manual to refer to banking organization participation in the futures, forward, standby contract, or options markets to purchase and sell U.S. government and agency securities or money market instruments, foreign currencies and other financial instruments.

Convergence—The process by which the futures market price and the cash market price of a financial instrument or commodity converge as the futures contract approaches expiration.

Covered Call Options—This term refers to the issuance or sale of a call option where the option seller owns the underlying deliverable security or financial instrument.

Cross Hedging—The process of hedging a ''cash'' or derivative instrument position with another cash or derivative instrument that has significantly different characteristics. For example, an investor who wants to hedge the sales price of long-term corporate bonds might hedge by establishing a short position in a treasury bond or treasury bond futures contract, but since the corporate bonds cannot be delivered to satisfy the contract, the hedge would be a cross hedge. To be successful, the price movements of the hedged instrument must be highly correlated to that of the position being hedged.

Difference Check—A difference check is sent by the party which recognizes a loss when a forward contract is closed out by the execution of an offsetting forward contract pursuant to a pair-off clause. In essence, the difference check represents a net cash settlement on offsetting transactions between the same two parties and replaces a physical delivery and redelivery of the underlying securities pursuant to offsetting contracts.

Financial Contract—This term is used in the manual to refer to financial futures, forward, standby contracts, and options to purchase and sell U.S. government and agency securities, money market instruments, foreign currency futures and other financial instruments.

Firm Forward Contract—This term is used to describe a forward contract under which delivery of a security is mandatory. See ''Standby Contract'' for a discussion of optional delivery forward contracts.

Forward Contracts—Over-the-counter contracts for forward placement or delayed delivery of securities in which one party agrees to purchase and another to sell a specified security at a specified price for future delivery. Contracts specifying settlement in excess of 30 days following trade date shall be deemed to be forward contracts. Forward contracts are usually non-standardized and are not traded on organized exchanges, generally have no required margin payments, and can only be terminated by agreement of both parties to the transaction. The term also applies to derivative contracts such as swaps, caps, and collars.

Futures Contracts—Standardized contracts traded on organized commodity exchanges to purchase or sell a specified financial instrument or commodity on a future date at a specified price. While futures contracts traditionally specified a deliverable instrument, newer contracts have been developed that are based on various indexes. Futures contracts based on indexes settle in cash and never result in delivery of an underlying instrument; some traditional contracts that formerly specified delivery of an underlying instrument have been redesigned to specify cash settlement. New financial futures contracts are continually being proposed and adopted for trading on various exchanges.

Futures Commission Merchant (FCM)—An FCM functions like a broker in securities. An FCM must register with the Commodities Futures Trading Commission (CFTC) in order to be eligible to solicit or accept orders to buy or sell futures contracts. The services provided by an FCM include a communications system for transmittal of orders, and may include research services, trading strategy suggestions, trade execution, and recordkeeping services.

Financial Futures Contracts—Standardized contracts traded on organized exchanges to purchase or sell a specified security, money market instrument, or foreign currency on a future date at a specified price on a specified date. Futures contracts on GNMA mortgage-backed securities and Treasury bills were the first interest rate futures contracts. Other financial futures contracts have been developed, including contracts on Eurodollars, currencies, and Euro-Rate differentials. It is anticipated that new and similar financial futures contracts will continue to be proposed and adopted for trading on various exchanges.

Futures Exchange—Under the Commodities Exchange Act (CEA), a ''board of trade'' designated by the Commodity Futures Trading Commission as a contract market. Trading occurs on the floor of the exchange and is conducted by open auction in designated trading areas.

GNMA or GINNIE MAE—Either term is used to refer to the Government National Mortgage Association. Ginnie Mae is a government corporation within the U.S. Department of Housing and Urban Development. In creating GNMA, Congress authorized it to grant a full faith and credit guaranty of the U.S. government to mortgage-backed securities issued by private sector organizations.

Hedge—The process of entering transactions that will protect against loss through compensatory price movement. A hedge transaction is one which reduces the organization's overall level of risk.

Initial Futures Margin—In the futures market, a deposit held by an FCM on behalf of a client against which daily gains and losses on futures positions are added or subtracted. A futures margin represents a good-faith deposit or performance bond to guarantee a participant's performance of contractual obligations.

Interest Rate Cap—A multi-period interest rate option for which the buyer pays the seller a fee to receive, at predetermined future times, the excess, if any, of a specified floating interest rate index above a specified fixed per annum rate (cap or strike rate). Caps can be sold separately or may be packaged with an interest rate swap.

Interest Rate Collar—the combination, in single contract, of a simultaneous sale of a cap and the purchase of a floor, or, a purchase of a cap and sale of a floor. The buyer of the collar is a buyer of a cap and the seller of a floor. By selling the floor, the collar buyer gives up the possibility of benefiting from a decline in interest rates below the strike rate in the floor component. On the other hand, the fee earned in selling the floor lowers the cost of protection against interest rate reversal.

Interest Rate Floor—is the reverse of an interest rate cap. The buyer pays a premium to obtain protection against a decline in interest rates below a specified level.

Long Contract—A financial contract to buy securities or money market instruments at a specified price on a specific future date.

Long Hedge—The long hedge, also called the *anticipatory hedge* is the process by which a market participant protects a cash or risk position by buying a futures or forward contract, i.e. taking a long financial contract position.

Maintenance Margin—Maintenance margin is the minimum level to which an equity position can decline as a result of a price decline before additional margin is required. In other words, it is the minimum margin which a customer must keep on deposit with a member at all times. Each futures contract has specified maintenance margin levels. A margin call is issued when a customer's initial margin balance falls below the maintenance margin level specified by the exchange. Maintenance margin must be satisfied by the deposit of cash or agreed upon cash equivalents. The amount of cash required is that amount which is sufficient to restore the account balance to the initial margin level.

Mandatory Delivery—See ''Firm Forward Contract.''

Mark-to-market—The process by which the carrying value (market value or fair value) of a financial instrument is revalued, and which is recognized as the generally accepted accounting principle for determining profit or loss on securities positions in proprietary trading and investment accounts. Futures positions are typically marked-to-market at the end of each trading session.

Naked Call Option—Refers to the issuance or sale of a call option where the option seller does not own the underlying deliverable security or instrument.

Open Interest—Refers to the number of futures contracts outstanding for a given delivery month in an individual futures contracts. The mechanics of futures trading require that for every open long futures contract there is an open short futures contract. For example, an open interest of 10,000 futures contracts means that there are 10,000 long contract holders and 10,000 short contract holders.

Options Contracts—Option contracts require that the buyer of the option pay the seller (or writer) of the option a premium for the right, but not the obligation, to exercise an option to buy (call option) or sell (put option) the instrument underlying the option at a stated price (strike or exercise price) on a stated date (European style option) or at any time before or on the stated expiration date (American style option). There are also exchange traded options contracts: (1) put and call options on futures contracts that are traded on commodities exchanges; and (2) put and call options that specify delivery of securities or money market instruments (or that are cash settled) that are traded on securities exchanges. The key economic distinction between options on futures and options on securities, is that the party who exercises an option on a futures contract receives a long or short futures position rather than accepting or making delivery of the underlying security or financial instrument.

Pair-Off Clause—A pair-off clause specifies that if the same two parties to a forward contract trade should subsequently execute an offsetting trade (e.g. a long contract against an outstanding short contract), settlement can be effected by one party sending the other party a difference check rather than having physical delivery and redelivery of securities.

Par Cap—This term refers to a provision in the contract of sale for Ginnie Mae mortgage-backed securities which restricts delivery only to pools which bear an interest rate sufficiently high so that the securities would trade at or below par when computed based on the agreed to yield.

Put Option—An option contract which gives the holder the right, but not the obligation, to sell (put) a specified quantity of a financial instrument (money market) or commodity at a specified price on or before the stated expiration date of the contract. If price of the underlying instrument occurs, the purchaser will exercise or sell the option. If a decline in price of the underlying instrument does not occur, the option purchaser will let it expire and will lose only the cost (premium paid) of (for) the option.

Round Turn—Commissions for executing futures transactions are charged on a round turn basis. A round turn constitutes opening a futures position and closing it out with an offsetting contract, i.e. executing a short contract and closing out the position with a long contract or vice-versa.

Short Contract—A financial contract to sell securities or money market instruments at a specified price on a specified future date.

Short Hedge—The process by which a customer protects a cash or risk position by selling a futures or forward contract, i.e. taking a short financial contract position. The purpose of the short hedge is to lock in a selling price.

Standby Contract—Optional delivery forward contracts on U.S. government and agency securities arranged between securities dealers and customers that do not involve trading on organized exchanges. The buyer of a standby contract (put option) acquires, upon paying a fee, the right to sell securities to the other party at a stated price at a future time. The seller of a standby (the issuer) receives the fee, and must stand ready to buy the securities at the other party's option. See the fuller discussion of Standby Contracts under 2130.0.3.1.2)

TBA (To Be Announced) Trading—TBA is the abbreviation used in trading Ginnie Mae securities for forward delivery when the pool number of securities bought or sold is ''to be announced'' at a later date.

Variation Margin—is when, in very volatile markets, additional funds are required to be deposited to bring the account back to its initial margin level, while trading is in progress. Variation margin requires that the needed funds be deposited within the hour, or when reasonably possible. If the customer does not satisfy the variation or maintenance margin call(s), the futures position is closed. Unlike initial margin, variation margin must be in cash. Also refer to ''Maintenance Margin''.

Weighted Hedge—a hedge that is used to compensate for a greater decline in the dollar value of a cash bond as compared to a price decline of an accessible T-bond futures contract.

Yield Maintenance Contract—This is a forward contract written with terms which maintain the yield at a fixed rate until the delivery date. Such a contract permits the holder of a short forward contract to deliver a different coupon security at a comparable yield.

2130.0.3 FINANCIAL CONTRACT TRANSACTIONS

Futures, forward and options contracts are merely other tools for use in asset–liability management. These contracts are neither inherently a panacea nor a speculative vehicle for use by banks and bank holding companies. Rather, the benefit or harm resulting from engaging in financial contract activities results from the manner in which contracts are used. Proper utilization of financial contracts can reduce the risks of interest or exchange rate fluctuations. On the other hand, financial contracts can serve as leverage vehicles for speculation on rate movements.

2130.0.3.1 Markets and Contract Trading

Forward contract (OTC) trading of Government National Mortgage Association (''GNMA'') or ''Ginnie Mae'' Mortgage-Backed Securities preceded exchange trading of GNMA futures contracts in 1975.

2130.0.3.1.1 Forward Contracts

Forward contracts are executed solely in an over-the-counter market. The party executing a contract to acquire securities on a specified future date is deemed to have a ''long'' forward contract; and the party agreeing to deliver securities on a future date is described as a party holding a ''short'' forward contract. Each contract is unique in that its terms are arrived at after negotiation between the parties.

For purposes of illustrating a forward contract, assume that SMC Corporation is an originator of government guaranteed mortgages and issuer of GNMA securities. SMC Corporation has a proven ability to manage and predict the volume of its loan originations over a time horizon of three to four months. To assure a profit or prevent a loss on current loan originations, SMC Corporation may enter binding over-the-counter commitments to deliver 75% of its mortgage production which will be converted into GNMA securities three months in the future. If SMC agrees to sell $3 million of GNMA securities (11% coupon) to the WP Securities Firm at par in three months, SMC Corporation is considered to have entered a "short" (commitment to sell) forward contract. Conversely, WP has entered a "long" (commitment to buy) forward contract. The two parties to the transaction are both now obligated to honor the terms of the contract in three months, unless the contract is terminated by mutual agreement.

It should be noted that executing a "short" forward contract is not the same as executing the short sale of a security. Generally, a short sale of a security is understood to represent the speculative sale of a security which is not owned by the seller. The short seller either purchases the security prior to settlement date or borrows the security to make delivery; however, a "short" forward contract merely connotes the side of the contract required to make delivery on a future date. Short forward contracts should not be considered inherently speculative, but must be considered in light of the facts surrounding the contract.

Forward trading can be done on a mandatory delivery (sometimes referred to as "firm forward" contracts) basis or on an optional delivery basis ("standby" contract). With respect to a "mandatory" trade, the contract can also be written with a "pair-off" clause. A pair-off clause specifies that if the same two parties to a trade should subsequently execute an off-setting trade (e.g., the banking organization executes a long contract against an outstanding short contract), settlement can be effected by one party sending the other party a "difference check" rather than having a physical delivery and redelivery of securities.

When a forward contract is executed by a dealer, a confirmation letter or contract is sent to the other party to the transaction. The contract will disclose pertinent data about the trade, such as the size of the trade, coupon rate, the date upon which final delivery instructions will be issued, and the yield at which the trade was effected. In addition, the contract letter will specify whether it is permissible for the "short" side of the trade to deliver a different coupon security at a comparable yield ("yield maintenance contract") if the coupon specified in the contract is not available for delivery. Contracts which prohibit the delivery of securities requiring a premium over par are considered to have a "par cap." The initial contract letter generally does not specify which specific securities (e.g., GNMA mortgage-backed securities identified by a pool number) will be delivered. Instead, such contracts generally identify the deliverable securities as having been traded on a "TBA" basis ("to be announced"). Prior to settlement, the dealer holding the short contract will send a final confirmation to the other party specifying the actual securities to be delivered, accrued interest, dollar price, settlement date, coupon rate, and the method of payment.

Forward contracts are not typically marked-to-market. Both parties in a forward contract are exposed to credit risk, since either party can default on its obligation.

2130.0.3.1.2 Standby Contracts

Standby contracts are "put options" that trade over-the-counter, with initial and final confirmation procedures that are quite similar to those on forward transactions. Standby contracts were developed to allow GNMA issuers to hedge their production of securities, especially in instances where mortgage bankers have extended loan commitments in connection with the construction of new subdivisions. When a mortgage banker agrees to finance a subdivision with conventional and government guaranteed mortgages it is difficult to predict the actual number of FHA and VA guaranteed loans which will be originated. Hence, it is risky for a GNMA issuer to enter mandatory forward contracts to deliver the entire estimated amount of loans eligible to be pooled as GNMA securities. By entering an option contract and paying a fee for the option to "put" securities to another party, a GNMA issuer or securities dealer obtains downside market protection, but remains free to obtain the benefits of market appreciation since it can "walk away" from the option contract. In addition to the flexibility of walking away and selling securities at the prevailing market price when GNMA prices are rising, a GNMA issuer avoids the potential risk of purchasing mortgages or GNMA securities to cover short forward contracts in the event that production of GNMA securities falls below anticipated levels.

When a securities dealer sells a standby contract granting a GNMA issuer the right "to put" securities to it, the dealer, in turn, will attempt to purchase a matching standby contract from an investor because the dealer does not want to shoulder all of the downside market risk. There is also potential for securities firms to deal in standby contracts having no relationship to the issuance of GNMA securities.

Some illustrations of standby contracts follow. They are intended to illustrate the mechanics of a standby contract when a banking organization has sold or issued a standby contract granting the contra party the option to "put" GNMA securities to the banking organization.

Assumptions

1. Fee paid to banking organization = 1% of contract value
2. Contract delivery price = 98
3. Coupon = 12%

Situation 1

On contract exercise date: Market Price = 100. Therefore, the dealer would sell securities at market rather than put them to the bank.

Dealer		*Banking organization*	
Sale price	100	Purchase price	N/A
Fee paid	(1)	Fee Received	1
	99		1

Result: Dealer sacrificed 1% to insure sale price.

Result: Banking organization earned 1% fee for "standing by."

Situation 2

On contract exercise date: Market price = 95. Therefore, dealer would deliver securities pursuant to the standby contract.

Dealer		*Banking organization*	
Sale price	98	Purchase price	98
Market price	95	Market price	95
Contract gain	3	Contract loss	(3)
Fee paid	(1)	Fee received	1
Actual gain	2	Actual loss	(2)

Result: Dealer paid 1% fee to avoid 3 point market loss.

Result: Banking organization received 1% fee to compensate for purchasing securities 3 points above market.

2130.0.3.1.3 Futures Contracts

Futures Contract transactions involve three types of participants: customers—the buyers or sellers of contracts, brokers, and a futures exchange. As in the forward markets, a buyer (party committed to take delivery of securities specified in the futures contract) of a futures contract has a "long" contract and the seller (party committed to deliver the underlying securities) has a "short" contract. If a customer desires to purchase (sell) a futures contract, the broker—possibly a member of a clearing house of an exchange—will take the order to the exchange floor and purchase (sell) a contract sold (bought) by another customer (through another broker).[1] All futures transactions are made

1. Brokers in commodities are required to register as futures commission merchants ("FCMs") with the Commodities Futures Trading Commission ("CFTC") in order to be eligible to solicit or accept orders to buy or sell futures contracts.

through and carried on the books of clearing house member brokers, who are treated by the exchange as their own customers. Hence, there are always an equal number of long and short contracts outstanding, referred to as the ‘‘open interest,’’ since the auction process requires a buyer and seller for every contract.

All futures contracts are obligations of an exchange’s clearing association or corporation, i.e. the clearing association is on the opposite side of each long and short contract; and all transactions are guaranteed within the resources of the exchange’s clearing association (on most futures exchanges a small fee is collected on each transaction and placed into an insurance fund). Should an FCM default on a futures contract, the association pays the costs of completing the contract.

2130.0.4 MARGIN REQUIREMENTS

In order to insure the integrity of futures markets, the clearing house requires that member brokers (clearing house members) deposit initial margin in connection with new futures positions carried for the firm, other brokers or FCMs for whom the clearing house member clears transactions, and public customers. The clearing house members in turn require their customers—whether they are other FCMs or public customers—to deposit margin.[2] The FCMs generally require that public customers meet initial margin requirements by depositing cash, pledging government securities, or obtaining irrevocable standby letters of credit from substantial commercial banking organizations. Daily maintenance margin or variation margin calls (deposits of cash required to keep a certain minimum balance in the margin account) based upon each day’s closing futures prices are calculated pursuant to rules of the various futures exchanges, and clearing house members are required to meet daily variation margin calls on positions carried for customers and the firm. In turn, the FCMs require customers to reimburse them for posting additional margin.

Once a customer has executed a futures contract to make or accept delivery of securities in the future it is obligated to fulfill the terms of the contract. A futures contract cannot be resold over-the-counter because futures contracts are not transferable. However, a customer may terminate its obligation under a futures contract either by making or accepting delivery of the securities as specified by the contract, or by executing an offsetting futures contract (long contract to cancel a short contract or vice-versa) with the same broker to cancel the original contract on the same exchange. The overwhelming majority of futures contracts are closed out by the execution of an offsetting contract prior to expiration.

The key to understanding futures transactions is the fact that futures contract prices on U.S. government and agency securities move in the same manner as bond prices; e.g. rising interest rates result in falling futures prices and falling interest rates result in rising futures prices. Hence, the purchase of a futures contract (‘‘long’’ futures contract) at a price of 98 will result in a loss if future market participants perceive rising interest rates in the month of contract expiration and act accordingly; then the offsetting of a futures contract (executing a ‘‘short’’ futures contract) would have to be at a lower price; e.g. 96. As in the case of any commercial transaction, the participant has a loss if the sale price is lower than the purchase price, or a gain if the sale price is higher than the purchase price.

2130.0.4.1 Variation Margin Calls

Variation margin calls for each contract and expiration month are based upon the closing futures exchange price. If there is a change from the previous day’s closing prices, the long contract holders will be required to post additional margin which will be passed through via the clearing house process to short contract holders or vice-versa. Subsequent to the computation of variation margin calls, the clearing house member brokers are required to post variation margin on behalf of the clearing firm and its customer accounts prior to commencement of the next day’s trading. Then, the clearing brokers call their FCM and public customers requesting more margin to bring the accounts up to the

2. In general, the futures exchanges set different initial margin requirements based upon the types of activity engaged in by the customer. Margin requirements are higher for customer contracts characterized as ‘‘speculative’’ than for those contracts deemed to be ‘‘hedge’’ positions. The commodities industry traditionally defines someone with a business need for using the futures market as a hedger; others are defined as speculators. Therefore, in instances where there are different initial hedge and speculative margin requirements, it is assumed that banking organizations will only be required to meet margin required for hedgers.

required maintenance margin level.[3] Of course, if a futures position has a gain at the end of the day, the clearing firm receives a deposit in its margin account. The firm, in turn, increases the margin account balances of customers holding contracts with gains.

For illustrative purposes, we will again assume that a customer purchased a futures contract (long contract, face value $100,000) at a price of 98. If the next closing futures price is 97, the customer will have suffered a one point margin loss (if the customer chose to offset the long contract with a short contract, the transaction would be closed out at a one point loss). Conversely, the party with a short contract executed at 98 would receive a one point margin payment to his account.

Assuming that the initial margin requirement is $1,500 and the variation margin requirement is $1,000, the following summarizes the steps followed in administering a customer's (long position) margin account in connection with the previously described transaction.

Transaction	*Margin Account Balance*
1. Deposit initial margin	$1,500
2. Purchase $100,000 contract @ 98	500
3. Day 1—Closing futures price 97 (Reduction of $1,000 in margin account to reimburse broker for posting margin with clearing corporation).	
4. FCM calls customer to request $1,000 to bring account up to required initial margin level.	
5. Reimbursement to FCM of $1,000	1,500

It is important to note that once the margin account balance falls below the variation margin level, the customer is required to deposit additional funds to replenish the account balance to the initial margin level. If there is a drop in the value of the contract which places the margin account balance below the initial margin level but above the variation margin level, the customer is not required to deposit additional margin monies. Alternatively, if there is a positive flow of margin monies the customer is free to withdraw any amount which exceeds the initial margin requirement.

The entire marking-to-the-market process is repeated at the close of the next business day using a comparison of the previous day's closing price (97) to the current closing price. (The preceding example is simplified because it implies that the customer deposits promptly the required margin. In reality, margin is not always deposited so quickly.)

In summary, futures trading is a ''zero sum game'' because of the equal number of long and short contracts outstanding, and the variation margin payments reflect this fact, i.e. for every long contract holder posting variation margin, there is a short contract holder receiving margin.

2130.0.5 THE DELIVERY PROCESS

Futures contracts are defined as ''standardized contracts traded on organized exchanges to purchase or sell a specified financial instrument or physical commodity on a future date at a specified price.'' Even when a participant keeps a contract open for delivery, the ''specified price'' (which corresponds to a specified yield) is actually obtained through a combination of past futures market gains or losses (incurred through the daily mark to market process) and the current futures market price. For invoicing purposes, the actual delivery price is based upon a closing futures market ''settlement price'' on a date designated by the exchange. In addition, the final calculation of a delivery price on a bond contract will typically involve an adjustment reflecting the fact that the coupon issue to be delivered against the contract grade (8 percent) futures contract is not an 8 percent bond. For example, when current U.S. treasury bond coupons are 12 percent it is highly unlikely that a party with a short futures position would deliver a bond with an 8 percent coupon.

2130.0.6 MECHANICS AND OPERATION OF FUTURES EXCHANGES

Certain technical factors should be noted with

3. It should be noted that public customers generally have more time to meet maintenance margin calls than do FCMs. However, if a customer fails to meet a variation margin call within three days, the FCM must take a charge against its net capital if it fails to close out the customer's contract (17 C.F.R. 1.17(c)5(viii)).

respect to futures markets. First, futures markets are not totally free markets. Rules of the exchanges put artificial constraints—daily price movement limits—upon the amount of daily market movement allowed in given types of futures contracts. For example, government securities prices in the cash market will move as far as the market participants deem necessary to reflect the ''market'' for those securities, while the futures market specifying delivery of the underlying security will be constrained from having the same potential unlimited market movement. There have been instances where persons desiring to close out a futures contract by executing an offsetting contract have been unable to do so for one or more days until the exchange's daily trading limits allowed futures prices to ''ratchet'' up or down to the level that reflected the true ''market'' price as perceived by hedgers, speculators, and arbitragers.

Although the preceding illustrates the basic nature of futures price movements, do not assume that futures and cash market prices always move in the same direction at the same velocity. Futures prices by definition predict future events, e.g., a market participant can buy a futures contract to take delivery of a three month Treasury bill two years in the future.[4] In such an instance, the holder of a long T-bill futures contract agrees to the future purchase of a government security which has not yet been issued. There is no reason to assume that a contract with a distant maturity will move in the same manner as the cash market for a three month Treasury bill. In addition, there is a relationship between the cash market price of an existing security and the price of that security in the futures market which is called the basis. The basis can vary significantly over the life of a given futures contract. In the contract delivery month, the futures market price will converge towards the cash market price (the basis approaches zero), adjusted for technical factors that reflect the costs of processing and delivering securities. If the futures market price did not converge towards the cash market price in the delivery month, the arbitragers would take offsetting futures and cash market positions to arbitrage away any profitable discrepancies between the two markets.

4. All financial futures contracts have a number of contract expiration months extending into the future. As the near term contract expires, a contract with a more distant expiration date is added.

2130.0.7 COMPARISON OF FUTURES, FORWARD, AND STANDBY CONTRACTS

Excluding the fact that futures contracts are traded on organized exchanges, there are many similarities between contracts. Conceptually, the contracts are interchangeable; each type of contract can be utilized for hedging, speculating, or arbitrage strategies, but none of the contracts are transferable to third parties. While engaging in contract activities allows the participants to either assume or shift the risks of interest rate changes associated with the security deliverable under the contract, such contracts fail to provide the other benefits of owning the underlying security. Specifically, financial contracts do not pay interest, do not have a U.S. government guaranty of payment of principal at maturity, and cannot be pledged to secure public deposits or be used as collateral for repurchase agreements. The forward markets are perceived to be delivery markets wherein there is a high percentage of delivery of the underlying security.

As in the case of other futures markets, the financial futures markets were not designed to be delivery markets. Nevertheless, there have been a number of instances when a relatively high percentage of financial futures contracts have resulted in delivery. Some persons suggest tax reasons and the deliverable supply of securities as two factors that have contributed to the much higher delivery of securities than delivery of physical commodities. It is, of course, also easier and cheaper to make delivery of securities rather than railroad carloads of grain.

Trading units on futures exchanges are standardized. The standardized trading unit in a physical commodity which may be a railroad car of grain; the typical trading unit in a government or agency security futures contract may be $100,000 or $1 million par principal at a coupon rate (on coupon issues) fixed by the exchange. On the other hand, forward and standby contracts are not traded in standardized units with given contract maturity months. Instead, forward and standby contracts are custom made to suit the needs of the two parties to the transaction.

While all contract holders are involved with market risks, the holders of forward and standby contracts are especially prone to credit risk. Unlike futures contracts where the mechanics of exchange trading provide for the futures exchange clearing association to guaranty performance of each contract, forward and standby contracts are only as good as the entity on the other side of the contract. Anyone who reads the financial press should be aware that prior to the passage of the Government Securities Act of 1986, there were a number of defaults involving forward and standby contracts. In an effort to bring increased integrity into the unregulated forward contract markets, there has been a trend by some of the major securities dealers to require the posting of margin in connection with forward contract trading. There are no uniform margin requirements governing all aspects of forward contract trading, nor is there a uniform application of margin requirements by dealers requiring ''house'' margin (or internal margin requirements established and enforced by individual securities dealers). GNMA has established limited margin requirements (24 C.F.R. 390.52), as described below.

2130.0.8 OPTION CONTRACTS

Subsequent to the Board's initial adoption of a policy statement governing futures, forward, and standby contracts, trading of interest rate options began on organized futures and securities exchanges. Proponents of exchange traded options argue that such instruments are attractive to users because they permit the user to obtain down side price risk protection, yet benefit from favorable price movement. In contrast, futures and forward contracts allow the user to lock in a specific price, but the user must forgo future participation if the market should experience an upward price movement. Furthermore, the purchaser of an option pays a one time premium for this protection and is spared the contingent liabilities associated with futures margin calls.

An option is a contract that gives the buyer, or holder, the right, but not the obligation, to buy or sell a specified financial instrument at a fixed price, called the exercise or strike price, before or at a certain future date. Some options, however do not provide for the delivery of the underlying financial instrument and, instead, are cash settled. Moreover, in some cases, the underlying financial instrument is an index. Options that can be exercised before or at the expiration date are referred to as American options; if an option can be exercised only on the expiration date, it is termed a European option.

There are two basic types of options: calls and puts. The *call option* is any option which obligates the writer to deliver to the buyer at a set price (exercise or strike price) within a specified time limit the underlying financial instrument. When the market price of the underlying instrument is above the exercise (strike) price of the call, the call option is ''in-the-money.'' Conversely, when the market price of the underlying financial instrument is below the exercise (strike) price of the call option, the call is ''out-of-the-money.'' When the market price of the underlying instrument is equal to the strike price, the option is ''at-the-money.'' At expiration, the buyer will exercise the option if it is ''in-the-money'' or let it expire unexercised if it is out-of-the-money. An out-of-the-money call option has no value at expiration, since buyers will not purchase the underlying instrument at a price above the current market price. Prior to expiration, the value of an ''in-the-money'' call option is at least equal to the market value of the underlying instrument minus the strike price. The ownership of a call provides significant leverage, but raises the breakeven price relative to ownership of the underlying instrument. Holding the call limits the amount of potential loss and offers unlimited potential for gains.

A *put option* gives the buyer the right, but not the obligation, to *sell* the underlying instrument at a specified price (exercise or strike price), before or at expiration. When the market price of the underlying instrument is below the strike price of the put option, the put is ''in-the-money,'' and a put option is out-of-the-money when the market price of the underlying financial instrument is above the strike price of the put option. Ownership of a put option offers leveraged profitability if the market value of the underlying instrument declines.

Some portfolio managers commonly employ ''covered'' call writing strategies to gain fee income from options written on securities held in the portfolio. If an option position is covered, the seller owns the underlying financial instrument or commodity or has a futures position. For example, an option position would be ''covered'' if a seller owns cash market U.S. Treasury bonds or holds a long position on a Treasury bond futures contract. Writing ''covered calls'' has only limited potential for gain. Writing ''covered calls'' is not a proper strategy for a market that could rise or fall by substantial amounts. It is generally used in a flat market environment.

Referring to the above example, if a seller holds neither the cash market U.S. Treasury Bonds or was not long on the Treasury bond futures contract, the writer would have an uncovered or ‘‘naked’’ position. In such instances, margin would be required (by the exchange, if an exchange traded option—not the case for an OTC option) since the seller would be obligated to satisfy the terms of the option contract if the option buyer exercises the contract. The risk potential for loss in writing ‘‘naked calls’’ (calls against which there are no securities held in portfolio) is great since the party required to deliver must purchase the required securities at current market prices. Naked ‘‘covered call’’ writing is generally viewed to be speculative since the risks are theoretically unlimited, particularly if it is done solely to generate fee income.

Options are purchased and traded either on organized exchanges or in the over-the-counter (OTC) market. Option contracts follow three-month expiration cycles (example: March/June/September/December). The option contracts expire on the Saturday following the third Friday in the expiration month. Thus, options are considered as ‘‘wasting assets’’ because they have a limited life since they expire on a certain day, even though it may be weeks, months, or years from now. The expiration date is the last day the option can be exercised. After that date the option is worthless.

Option premium valuation. The price (value) of an option premium is determined competitively by open outcry auction on the trading floor of the exchange. The premium value is affected by the inflow of buy and sell orders reaching the exchange floor. The buyer of the option pays the premium in cash to the seller of the option which is credited to the seller’s account. Several factors affect the value of an option premium, as discussed below. The option premium consists of two parts, ‘‘intrinsic value’’ and ‘‘time value.’’ *The intrinsic value* is the gross profit that would be realized upon immediate exercise of the option. Stated another way, it is the amount by which the option is in-the-money. It is the higher of: the value of an option if it is exercised today; or zero. For ‘‘in-the-money’’ *call* options, it is the difference between the price of the underlying financial instrument, and the exercise (strike) price of the option. For ‘‘in-the-money’’ *put* options, it is the difference of the exercise (strike) price of the put option and the price of the underlying financial instrument. The intrinsic value is zero for ‘‘at-the-money’’ or ‘‘out-of-the-money’’ options. The *time value* derives from the chance that an option will gain intrinsic value in the future or that its intrinsic value will increase before maturity of the contract. Time value is determined by subtracting intrinsic value from the option premium. For example,

Time value = Option premium – Intrinsic values

Time value = 5–10/64 – 4.00

Time value = 1.15384

The option premium is affected by several other factors. One factor involves the comparison of the underlying futures price versus the strike price of the option. An option’s price is increased the more that it is in-the-money. A second factor is volatility. Volatile prices of the underlying financial instrument can help stimulate demand for the options, thus increasing the premium. A third factor that affects the premium of an option is the time until expiration. Option premiums are subject to greater price fluctuations because the underlying value of the futures contract changes more with a longer time period. Other factors that affect the option premium are the strike rate(s) and the domestic and foreign (if applicable) interest rates.

An exchange-traded option is often referred to as a ‘‘standardized’’ option, reflecting the fact that the terms of the contract are uniform with respect to the underlying instrument, amounts, exercise prices, and expiration dates. OTC options are characterized by terms and conditions which are unique to each transaction. Large financial institutions are often dealers in customized interest rate or foreign exchange options. For example, a banking organization might write a ‘‘cap,’’ or series of put option on pounds sterling to protect the dollar value of a sterling denominated receivable due in one year. In this case, an option can be tailored to fit the exact needs of the buyer.

Like futures contracts, contract performance on exchange-traded options is guaranteed by the clearing corporation which interposes itself as a central counterparty to all transactions. It substitutes itself as a seller to all buyers and as a buyer to all sellers. Standardization combined with the clearing corporation’s guarantee facilitates trading and helps to insure liquidity in the market. The buyer or seller of an exchange-traded option may always close out an open position by entering into an offsetting transaction, with the same strike price and expiration date, and for the same amount. Indeed, most exchange-traded options are liquidated prior to maturity with an offsetting transaction, rather than by exercising the option in order to buy or sell the underlying instrument.

Buyers of exchange-traded options are not required to post funds to a margin account because their risk is limited to the premium paid for the option. However, writers (sellers) of options are required to maintain margin accounts because they face substantial amounts of risk. The amount of the margin varies depending upon the volatility in the price of the option. As the option moves closer and closer to being in-the-money, the writer is required to deposit more and more into his margin account, in order to guarantee his performance should the option eventually be exercised.

Options on futures contracts provide the holder with the right to purchase (call) or sell (put) a specified futures contract at the option's strike price. The difference between the strike price on the option and the quote on the futures contract represents the intrinsic value of the option. Options on futures contracts differ from traditional options in one key way: the party who exercises an option on a futures contract receives a long or short futures position (depending on whether he is exercising a call or put option) rather than accepting or making delivery of the underlying security or financial instrument. When the holder of a call option on a futures contract exercises the option and the futures contract is delivered, the option writer must pay the option holder the difference between the futures contract's current value and the strike price of the exercised call. The buyer takes on a long position, and the writer a short position in the futures contract. When a futures put option is exercised, the holder takes on a short futures position, and the writer a long position. The writer of the put pays the holder the difference between the current price of the futures contract and the strike price of the put option. The resultant futures position, like any other futures position, is subject to a daily marked-to-market valuation. In order to liquidate the futures position, both the buyer and the seller must undertake offsetting futures transactions.

2130.0.8.1 Other Option Contracts

2130.0.8.1.1 Stock Index Options

A stock index option is a call or a put that is based on a stock market index such as the S & P 500. As opposed to a regular call or put option on equity securities where there must be a sale and delivery of shares of stock, there is no delivery of the underlying instrument when an index option is exercised. Rather, settlement is in cash.

2130.0.8.1.2 Foreign Currency Options

The right to buy (call) or sell (put) a quantity of a foreign currency for a specified amount of the domestic currency is a foreign currency option. The size of the contract is standard for each currency. The contracts are quoted in cents per unit of foreign currency. As an example, one call option for the British pound is 12,500 pounds.

2130.0.8.2 Caps, Floors, and Collars

Caps, floors, and collars provide risk protection against floating interest rates. The market for these products is an outgrowth of the OTC market in fixed income (bond) options.

An interest rate cap contract pays the buyer cash if the short term interest index rises above the strike rate in the contract in exchange for a fee. In combination with a floating rate obligation, it effectively sets a maximum level on interest rate payments. If market rates are below the cap rate, no payments are made under the cap agreement. Thus, the buyer of a cap is able to place a ceiling on his floating rate borrowing costs without having to forego potential gains from any decline in market rates.

Cap agreements typically range in maturity from 6 months to as long as 12 years, with reset dates or frequencies that are usually monthly, quarterly, or semiannual. The London Interbank Offered Rate (LIBOR) is the most widely used reference rate for caps, floors, and collars. Other indexes used as reference rates are commercial paper rates, the prime interest rate, Treasury bill rates, and certain tax-exempt rates. Cap fees depend upon the cap level, the maturity of the agreement, the volatility of the index used as the reference rate, and market conditions. The higher the cap rate, the lower the premium. The fee is usually paid up front, but can be amortized.

An interest rate floor agreement is used to protect the overall desired rate of return associated with a floating-rate asset. In accordance with the agreement, the seller receives a fee for the floor agreement from the holder of the underlying asset. When interest rates fall, the holder of the floor contract is protected by the agreement, which specifies the fixed per annum rate (floor rate) that will be retained on those assets, at specified times during the life of the agreement, even though floating interest rates may decline further.

An interest rate collar is a variation of a cap-only agreement. Under this arrangement the seller of the collar, for a fee, agrees to limit the buyer's floating rate of interest within one agreement by a simultaneous sale of a cap and purchase of a floor, or purchase of a cap and sale of a floor. When the reference rate is above the cap rate the seller makes payments to the buyer sufficient to return the buyer's floating rate interest cost to the cap rate. Conversely, the buyer makes payments to the collar provider to bring its rate back to the floor whenever the reference rate falls below the floor rate. In effect, under a collar agreement the buyer is selling a string of call options (the floor) back to the provider of the cap. The premium received from selling the floor reduces the overall cost of the cap to the buyer of the collar. Thus, the premium for a floor/ceiling, or collar, agreement, is lower than for a cap-only agreement with the cap at the same level. This is because the floor sold to the provider of the collar has a certain value, which is passed along to the buyer in the form of a lower premium.

The disadvantage to collars, of course, is that they limit the buyer's ability to profit from declines in market rates below the specified floor. Clearly, one's interest rate expectations play an important role in determining whether or not to use a collar agreement. It should also be noted that collar agreements involve credit risk on both sides of the agreement, similar to the credit risk considerations found in interest rate swap agreements. The buyer of the collar is exposed to the risk that the provider may default on payments due under the cap agreement; and the provider of the collar is exposed to the risk that the buyer may default on payments due under the floor agreement.

2130.0.9 REGULATORY FRAMEWORK

GNMA has adopted limited margin requirements. Specifically, the GNMA margin requirements (12 C.F.R. 390.52) require marking-to-market and the posting of maintenance margin.[5] However, the GNMA margin requirements exclude the majority of GNMA forward contracts and only pertain to contracts involving GNMA issuers with other parties.[6]

The Commodities Futures Trading Commission ("CFTC") is the agency authorized by Congress to supervise the trading of "commodities," including financial futures. Exchanges which trade commodities must register with the CFTC. In addition, the various futures exchanges must receive CFTC approval before they can begin trading a new futures instrument. Brokers and dealers who execute futures contracts for customers must register as Futures Commission Merchants ("FCM") with the CFTC. There are also CFTC registration requirements pertaining to firms engaging in commodities activities similar to an investment advisor or mutual fund in the securities markets. Finally, the surveillance activities of the various futures exchange examiners are subject to oversight by the CFTC.

With the exception of reporting requirements concerning persons or entities with large futures positions, the CFTC's jurisdiction generally does not extend to financial institutions. Rather, the federal and state banking agencies, state insurance commissions, and the Office of Thrift Supervision are responsible for supervising regulated entities' future activities, if permitted, under statute or regulation.

2130.0.10 EXAMPLES OF CONTRACT STRATEGIES

For purposes of reporting large positions to the CFTC a market participant defines its future activities as "speculative" or as "hedging." Basically, CFTC rules consider a participant to be a hedger if certain facets of such person's business can be hedged in the futures markets; persons who do not have a business need for participating are deemed to be speculators. It is anticipated that bank holding companies characterize their contract activities as "hedging", or possibly as arbitrage between various markets.

5. Initial margin requirements necessitate the pledging of something of value prior to initiation of a transaction. Depositing maintenance margin refers to pledging something of value in reaction to market movements; e.g. depositing cash representing the difference between a forward contract price and its current market value.

6. See SR-625 dated July 23, 1980.

Examiners must scrutinize contract positions for purposes of evaluating risk.

The Board policy statement concerning bank holding companies[7] states:

"... the Board believes that any positions that bank holding companies or their nonbank subsidiaries take in financial contracts should reduce risk exposure, that is, not be speculative." It should be noted, however, that a more liberal interpretation of the policy statement has been permitted for dealer subsidiaries. For example, in a government securities dealer subsidiary, it is permissible to use related financial contracts as a substitute trading instrument for cash market instruments. Thus, the use of financial contracts is not limited solely to reducing the risk of dealing activities.

Some examples of contract strategies are provided which reduce risk when viewed in isolation. A definition of a financial hedge is:

"to enter transactions that will protect against loss through a compensatory price movement."

In looking at a hedge transaction in isolation, there should be certain elements present to make a hedge workable:

1. The interest rate futures or forward contract utilized should have a high positive correlation (prices that tend to move in the same direction with similar magnitude) with the cash position being hedged. In other words, the futures or forward position taken should be structured so that an upward price movement in the contract offsets a downward price movement in the cash or risk position being hedged, and vice versa.

2. The type (e.g. T-bill, T-bond, etc.) and size of the contract position[8] taken should have a proportionate relationship to the cash or risk position being hedged, so that futures gains (losses) will approximately offset any losses (gains) on the hedged position.

3. The contract position taken should have a life which is equal to or greater than the end of the period during which the hedge will be outstanding. For example, if interest rate protection was deemed necessary for a six-month time span, it would not ordinarily be wise to enter a contract expiring in three months.

2130.0.10.1 The Mortgage Banking Price Hedge

Assume that a mortgage banking subsidiary agrees in June to originate mortgages at a fixed yield in the following October. Unless the loan originator has a forward commitment to sell the loans to a permanent investor(s), it is exposed to a decline in the principal value of mortgages due to a rise in interest rates between the commitment date and ultimate sale of the loans. An example of a traditional "short hedge" would be the sale of futures contracts in an attempt to reduce the risk of price fluctuation and insure a profitable sale of the loans. However, in following this strategy the mortgage originator also chooses to forfeit its ability to reap a profit if interest rates should fall.

If interest rates increased, the loss on the sale of mortgages or a pool of mortgage-backed securities will probably be largely offset by a gain on the futures transaction; see example below. If interest rates fall, the mortgage originator would gain on the resale of mortgages but lose on the futures market transaction. Hence, in a true hedge, the hedger's earnings are relatively unaffected by a change in market interest rates in either direction.

Generally accepted accounting principles applicable to mortgage activity require that mortgages held for resale be periodically revalued to the lower of cost or market (Financial Accounting Standards Board Statement No. 65, "Accounting for Certain Mortgage Banking Activities"). Unrealized gains and losses on outstanding futures contracts are matched against related mortgages or mortgage commitments when the inventory is revalued to the lower of cost or market; i.e. the lower of cost or market valuation is based upon a net figure including unrealized related futures gains and losses.

2130.0.10.2 Basis

Basis is the difference between the cash (spot) price of a security (or commodity) and its futures price. In other words:

---

7. The Board's policy statement on engaging in futures, forwards, and option contracts.

8. Futures market participants engage in a practice, sometimes known as "factorweighting" or "overhedging," to determine the appropriate number of futures contracts necessary to have the proper amount of compensatory price movement against a hedged cash or risk position. For example, it would require 10 mortgaged-backed futures contracts (8% coupon, $100,000 face value) to hedge an inventory of $1,000,000 mortgage-backed (8% coupon) securities. Alternatively, 14 mortgage-backed futures contracts would be required to hedge a $1 million inventory of mortgage-backed securities with a 13½% coupon. Overhedging or factor weighting is necessary in hedging securities with higher coupons than those specified in futures contracts (currently 8% on bond futures) because higher coupon securities move more in price for a given change in yield than lower coupons.

Basis = Spot price − Future price

For short-term and intermediate futures contracts, the futures price is the quoted futures price times an appropriate conversion factor. For short-term futures contracts the quoted futures price is 100 less the annualized futures interest rate. The invoice price must be determined using yield-to-price conventions for the financial instrument involved.

Basis may be expressed in terms of prices. Due to the complexities involved in determining the futures price, it is thus better to redefine price basis using actual futures delivery prices rather than quoted futures prices. Thus, the price basis for fixed income securities should be redefined as:

Price Basis = Spot price − Futures delivery price.

Basis may also be expressed in terms of interest rates. The *rate basis* is defined as:

Rate basis = Spot rate − Futures rate

The spot rate refers to the current rate on the instrument that can be held and delivered on the contract. The futures rate represents the interest rate that corresponds to the futures delivery price of the deliverable instrument.

The rate basis is useful in analyzing hedges of short-term instruments since it nets out all effects resulting from aging. For example, if a one year T-bill has a rate of 9 percent with a price of 85, and a 3-month T-bill has a rate of 9 percent and a price of 94, the price basis would be −9. If a cash security ages, it does not necessarily mean that a change in the rate basis has taken place.

2130.0.10.3 Trading Account Short Hedge

Another example of a short hedge pertains to securities dealers that maintain bond trading accounts. While bonds are held ''long'' (actually owned by the dealer) in trading accounts, dealers are subject to two risks. First, there is the risk that the cost can change regardless of whether the funds are generated through repurchase agreement financing or the dealer's other funding sources. When there is an inverted yield curve (short-term interest rates are higher than long-term rates), trading portfolio bonds in inventory yield less than the cost of funds required to carry them. Second, there is the risk that bond market interest rates will rise, thus forcing the dollar price of bonds down.

2130.0.10.3.1 Example 1: A Perfect Short Hedge[1]

Month	*Cash Market*	*Futures Market*
June	Mortgage department makes commitment to a builder to originate $1 million of mortgages (based on current GNMA 8's cash price) at 98-28⁄32 for $988,750	Sells 10 December mortgage-backed futures at 96-8⁄32 for $962,500 to yield 8.59 percent
October	Mortgage department originates then *sells* $1 million of pooled mortgages to investors at a price of 95-20⁄32, for $956,250	Buys 10 December mortgage-backed futures at 93, for $930,000 to yield 8.95 percent
	Loss: $32,500	Gain: $32,500

1. The effects of margin and brokerage costs on the transaction are not considered. It should be noted that ''perfect hedges'' generally do not occur.

The following example pertains to a bond trading account. Assume that the dealer purchases Treasury bonds on October 4 and simultaneously sells a similar amount of Treasury bond futures contracts. The illustration ignores commission charges and uses futures contracts maturing in March 19x9 because the dealer's technical analysis discovered an advantage in using the March 19x9, rather than the previous December contract as a hedge. (At that time the previous December contract was the next available contract still trading.)

	Cash Market		Futures Market	
10/04/1998	Purchase $5MM T-bonds maturing Aug. 2005, 8% coupon at 87-$\frac{10}{32}$:		Sell $5MM T-bonds futures contracts expiring Mar. 1999 at 86-$\frac{21}{32}$:	
	Principal =	$4,365,625	Contract value =	$4,332,813
10/23/1998	Sell $5MM T-bonds at 79.0:		Buy $5MM T-bond futures Mar. 1999 at 79-$\frac{1}{32}$	
	Principal =	3,950,000	Contract value =	3,951,563
	Cash loss =	($415,625)	Futures gain =	$381,250

Although the hedge did not prevent the dealer's trading account from losing money, it limited the loss to $34,375 instead of $415,625.

It is worth noting that the preceding example also illustrates some of the dangers of using interest rate futures contracts. Although the futures market proved useful to the trading department, a futures contract could have serious consequences for a dealer using an alleged "long hedge to lock-in an attractive yield."

2130.0.10.4 Long Hedge

In certain areas of the country, financial institutions desiring to hold public deposits are required to bid competitively for deposits. The case discussed below pertains to a situation where the competitive bids must be tendered one calendar quarter in advance of receiving the deposit. In this example, the asset side of the balance sheet is not discussed since it is assumed that a banking organization paying the prevailing one-year C.D. interest rate can utilize the funds at a profitable spread.

In this type of situation the bidding institutions are generally vulnerable to falling interest rates; one can safely assume that an institution selected to hold public deposits would not be dismayed to learn subsequently that interest rates had risen and it had locked-in a funding source at or below market rates. However, the funds will not be received for another 3 months. Thus, there is the possibility that interest rates could drop in the interim, leaving a reduced or possibly negative net interest margin when the funds are deployed.

There are a number of approaches available to attempt to ensure that future time deposits can be obtained without paying higher than market interest rates. One method is forecasting the appropriate interest rate to be paid on a given time deposit three months in the future. However, forecasting has become increasingly difficult to do with accuracy in the recent periods of fluctuating interest rates. An alternative approach would be to quote the current C.D. rate (adjusted slightly for competitive factors) with an intent to hedge in the futures market if the banking organization's interest rate bid is accepted. Upon receiving notification that its deposit bid has been accepted, the institution can then purchase an appropriate number of futures contracts to insure a profitable investment spread three months hence when it actually receives the deposit.

The following example on June 1, 19x0; the facts are as follows:

Size of public deposits offered	$10 million
Date of deposit	September 2, 19x0
Term	1 year
Current C.D. rate	8¼%

For purposes of this illustration, assume that a bid was submitted to pay 8¼% for one year on $10 million. The bids were due June 1 and notification was given June 2 of the intention to provide the funds on September 2; and the banking organization decided to purchase futures contracts on June 2.

A Treasury bill futures contract, expiring in 3 months, is selected as the hedging vehicle because it reflects price movement of an instrument with a comparable maturity to one-year

C.D., and there was no C.D. futures contract trading. For purposes of this illustration, it is assumed that the contract offers sufficient liquidity to enable the banking organization to readily offset its open futures position when necessary. Using the bill contract is an example of "cross hedging" which is defined as the buying or selling of an interest rate futures contract to protect the value of a cash position of a similar, but not identical, instrument. This type of hedging is a measured risk since the outcome of such a transaction is a function of the price correlation of the instruments being hedged. At any given moment it is conceivable that a negative correlation could exist between two unlike instruments despite the presence of a strong correlation over an extended time period.

Date	*C.D. Rate*	*Transactions*	*T-bill*	*Futures* [1]
June 2, 19x0	8.25%	Purchase 40 Contracts	91.84	8.16%
Sept. 2, 19x0	11.00%	Sell 40 Contracts	90.05	9.95%

1. The size of the trading unit is based upon U.S. T-bills having a face value at maturity of $250,000 (40 × 250M = 10MM). Prices are quoted in terms of an index representing the difference between the actual T-bill yield and 100.00. Every one basis point movement on a contract is equal to $25.00 per contract.

2130.0.10.4.1 Evaluation of the Hedge

Total interest (not compounded) to be paid (8¼%)	$ 825,000
Alternative C.D. interest (not compounded) at current rate (11%)	1,100,000
Difference	275,000
Futures trading loss*	(179,000)
Net difference	$ 96,000

*Computation—Purchase price 91.84
Sale price 90.05
1.79 or 179 basis points
(179 × $25.00 × 40 contracts = $179,000)

In retrospect, it would have been better if the banking organization would not have hedged. By agreeing to an interest rate on June 2, it obtained deposits on September 2 and will pay approximately $275,000 less in interest payments to the municipality than is required on an ordinary C.D.(s) issued on September 2. The $179,000 futures trading loss, of course, reduced the windfall interest income due the banking organization. A net interest income spread of approximately $96,000, instead of a $275,000, demonstrates two principles: 1) cross hedging can cause unexpected results; and 2) it is quite difficult to find perfect hedges in the real world. The hedge was structured so that a cash gain was offset by a futures loss—incorporating the offsetting principles of a hedge transaction. If the general level of interest rates had fallen, a futures gain should have occurred to offset the higher (relative to prevailing market rates) cost of funds obtained on September 2.

2130.0.10.5 Using Options to Create an Interest Rate Floor

Assume that on September 28th it is decided to rollover a $1,000,000 investment in 13-week Treasury bills on November 28, which also happens to be the expiration date for call options on the December Treasury bill futures contract. The banking organization, concerned that interest rates will fall between September 28 and the rollover date, wishes to hedge the rollover of its investment. The portfolio manager can set a minimum yield on the rollover investment by either buying a Treasury bill future call option, or by buying a Treasury bill futures contract. Further assume that the December Treasury bill futures contract can be bought for a price of 93.70 which implies a discount yield of 6.30 percent. Treasury bill futures call options with a strike price of 93.75, implying a discount yield of 6.25 percent, sell for a premium of 20 basis points, or $600 (20 basis points × $25/basis point = $500).

If the banking organization could actually buy a Treasury bill futures contract that expired on exactly November 28, then there would be a perfect hedge since the rate of return on the bills would be explicitly fixed by the futures hedging strategy. However, the closest maturing Treasury bill futures contract expires in December, several weeks after the rollover date for the banking organization's investment. Uncertainty over the actual discount yield of the Treasury bills on the rollover date and the yield produced by the hedge is known as ‘‘basis risk,’’ the risk that the yield on the hedge may differ from the expected yield on the hedged item. For purposes of this example, assume that the yield on the futures contract equals the actual discount yield on the 13-week Treasury bills at the rollover date. Thus, the futures hedge in this example will provide an effective discount yield of 6.30 percent on the rollover of the 13-week Treasury bill investment.

Assume that rates fall after September 28 and that the discount yield on Treasury bill futures contracts declines from 6.30 percent to 6.00 percent at the November 28 expiration date of the December Treasury bill futures options contract. The option to buy the Treasury bill futures will be exercised since the strike price of 93.75 is below the market price of 94.00 for the underlying futures contract, yielding a profit of 25 basis points or $625 (25 basis points × $25/basis point). The profit must be offset by the 20 basis point cost of the option, which reduces the net profit to 5 basis points. The effective hedged discount yield is 6.05 percent (6.00 percent on the 13-week Treasury bills—assuming no basis risk—plus the 5 basis point profit from the hedge). The option hedge produces a yield that is 5 basis points higher than the unhedged yield, but 25 basis points lower than the 6.30 percent yield that would have resulted from hedging with futures.

Although the option hedge resulted in a lower effective yield than the futures hedge, it set an absolute floor on the investment. This is because any decline in the discount yield of the Treasury bills below 6.05 percent would be offset dollar for dollar by the additional profits from the hedge. The real advantage of the option hedge is that, although it establishes a floor that is lower than the rate fixed by the futures hedge, it allows the hedger to participate in any increase in interest rates above the cost of the call premium. For example, if interest rates increased such that the price on the December Treasury bill futures contract on November 28 falls to 93.00, implying a discount yield of 7.00 percent, the option would expire unexercised since the strike price is above the price of the underlying futures contract. Again, assuming that the spot price for the 13-week Treasury bills is equal to the futures price, the effective discount yield is 6.80 percent (7.00 percent minus the 20 basis point call option premium), 50 basis points higher than the yield that would have been provided by the futures hedge.

2130.0.10.6 Hedging a Borrowing with an Interest Rate Cap

In order to limit a borrower’s interest rate risk, sophisticated banking institutions may offer cap agreements as part of a loan package to their clients. While such an arrangement provides some comfort that the borrower’s ability to repay will not be jeopardized by a sharp increase in interest rates, it obviously transfers that interest rate risk back to the lender. Nevertheless, many banking institutions feel they are better able to manage that risk than are some of their clients. Cap agreements have also been utilized to cap the rate on issued liabilities. For example, an institution might be able to issue medium-term floating rate notes at 3-month LIBOR plus an eighth of a percent. Alternatively, that institution could issue a capped floating rate note at 3-month LIBOR plus three-eights of a percent. By subsequently selling the cap separately back into the market the institution could, achieve sub-LIBOR funding, depending on the proceeds from the sale of the cap.

A cap agreement is typically specified by following terms: notional principal amount; maturity; underlying index, frequency of reset, strike level. As an illustration, a cap agreement might have the following terms:

Notional Principal Amount	$10,000,000
Maturity	2 Years
Underlying Index	3-month LIBOR
Rate Fixing	quarterly
Payment	quarterly, in arrears, on an actual/360-day basis
Cap Level	9%
Up Front Fee	1.11% of par ($111,000)

Under the terms of this agreement, if at any of the quarterly rate fixing dates 3-month LIBOR exceeds the cap level then the seller of the cap would pay the buyer an amount equal to the difference between the two rates. For example, if at a reset date LIBOR was set at 10 percent, the payment would be:

10%(90/360 × $10,000,000)

–

9%(90/360 × $10,000,000)

=

$25,000

Thus, the writer of the cap would pay the buyer $25,000. If 3-month LIBOR for the quarter were set at or below the cap level of 9 percent, no payment would be made.

2130.0.11 ASSET-LIABILITY MANAGEMENT

Financial contracts can be used as a tool in an overall asset-liability management strategy. In order to use financial contracts in this context, a BHC or nonbank subsidiary must first identify where interest-rate exposure lies as indicated by mismatches between asset and liability structures. In those instances where the BHC or nonbank subsidiary has variable-rate assets and variable-rate liabilities with comparable maturities, there is, in theory, no need to hedge with financial contracts since that portion of the asset-liability structure is already hedged. The same holds true for fixed-rate assets and liabilities (yielding a positive interest-rate margin) of comparable maturities. Once a BHC or nonbank subsidiary has identified the undesired mismatches in assets and liabilities, financial contracts can be used to hedge against the identifiable mismatch—for example, long positions in contracts can be used as a hedge against funding interest-sensitive assets with fixed-rate sources of funds, and short positions in contracts can be used as a hedge against funding fixed-rate assets with interest-sensitive liabilities.

BHCs or nonbank subsidiaries that choose to employ financial contracts as a tool in their general asset-liability management program and properly use financial contracts are striving towards worthwhile goals. The discipline of identifying mismatches between assets and liabilities tends to focus the practitioner's attention on the entire balance sheet. Examiners should be aware that marketing efforts on behalf of the futures exchanges have attempted to focus upon just one side of the balance sheet by ''pairing'' a futures contract with an asset or a liability. In considering financial-contract activities, examiners need to remember that financial-contract activities must be evaluated in light of both sides of a balance sheet.

One final point should be made with respect to ''hedging'' based upon pairing a futures contract against a portfolio security. Since this type of ''hedging'' can be done while considering only the asset side of the balance sheet, it is possible that such a strategy could increase interest-rate risk rather than reduce it. For example, assume (unrealistically) that there is a perfect balance between variable-rate assets and liabilities, and the firm is evaluating fixed-rate assets and liabilities. Management determines that there is a perfect balance between fixed-rate assets and liabilities and then isolates the last fixed-rate asset and liability. Make the further assumption that the organization holds a six-month note yielding 12 percent which is financed by funds maturing in six months which costs the organization 10.5 percent. By executing a short futures contract ''paired'' against the six-month note, the organization would move from an overall ''hedged'' position to an ''unhedged'' position. In other words, the futures contract would move the organization from an overall neutral position and expose the organization to interest-rate risk.

It should be evident why it is more productive to consider the ''big picture'' in inspections rather than focusing upon individual or ''paired'' (futures against each position) transactions. The most meaningful approach is to evaluate hedging strategies and open financial contract positions in light of its business needs, operations, and asset-liability mix.

2130.0.12 INSPECTION OBJECTIVES

1. To determine the purpose of financial-contract positions. Any positions that bank holding companies or their nonbank subsidiaries (except certain authorized dealer subsidiaries) take in financial contracts should reduce risk exposure, that is, not be speculative.
2. To determine whether prudent written policies, appropriate limitations, and internal controls and audit programs have been established and whether management information systems are sufficiently adequate to monitor risks associated with contracts involving futures, forwards, and options (including caps, floors, and collars).
3. To determine whether policy objectives concerning the relationship of subsidiary banking organizations and the parent bank hold-

ing company specify that each banking organization in a holding company system must be treated as a separate entity.

4. To determine reporting compliance in accordance with the Board's bank holding company policy statements. See section 2130.0.17 for the appropriate cites.

2130.0.13 INSPECTION PROCEDURES

The term "banking organization" is used generally to refer to a bank holding company, the parent company, or nonbank subsidiary.

1. Determine if the banking organization's financial-contract activities are related to the basic business of banking.

   Consider whether the financial-contract activities are closely related to the basic business of banking; that is, taking deposits, making and funding loans, providing services to customers, and operating at a profit for shareholders without taking undue risks. Taking financial-contract positions solely to profit upon interest-rate forecasts is considered to be an unsafe and unsound practice. Profitability of contract activities is not the criterion for evaluating such activities. It is quite probable that a bona fide hedge strategy could result in a contract loss which would be offset by increased interest earnings or a higher price for an asset sold, for example, a pool of mortgages. Criticize contracts placed solely to profit upon interest-rate movements. Verify that contract activities are conducted in accordance with the Board's policy statement. Where contract positions are of excessive size and could jeopardize the financial health of the entity under examination, the gains or losses realized because of financial-contract activities should be criticized.

2. Ascertain whether policy objectives highlight the circumstances under which financial contracts should be used.

   Determine whether management and operating personnel have received sufficient guidance. Carefully constructed policy objectives should be formulated with the knowledge that although proper utilization of financial contracts limits loss potential, such utilization also limits potentials for gains. Policy objectives should be formulated to limit required resources (margin monies, commissions, and personnel to execute, monitor, and audit contract activities). A well-constructed policy should be designed to preclude various operating areas of a banking organization from taking offsetting financial contract positions. Finally, there should be established benchmarks for determining whether financial contracts are meeting desired objectives.

3. Determine if policy objectives concerning the relationship of subsidiary banking organizations and the parent bank holding company comply with the Board's directives.

   Each banking organization in a holding company system must be treated as a separate entity. The policy statement accommodates centralized holding companies in that the holding companies are free to provide guidance to subsidiary banking organizations and execute contracts as agent on behalf of the banking organization, provided that each banking organization maintains responsibility for financial contract transactions executed on its behalf. Accordingly, a holding company that has centralized management could, and perhaps should, consider the interest-rate exposure of its subsidiary banks on a consolidated basis in determining whether future contracts can usefully be employed to reduce that exposure, but any future contracts that are executed must be recorded on the books and records of a subsidiary bank that will directly benefit from such contracts.

   The question concerning the relationship of a subsidiary bank to its holding company may also lead one to consider the relationship of a subsidiary bank with its correspondent bank or broker. One might also query to what extent may less sophisticated institutions rely upon brokers and/or correspondent banking organizations for advice in this area?

   Less sophisticated institutions can place only limited reliance on others for advice in this area. The bank holding company policy statement[9] emphasizes that responsibility for financial-contract activities rests solely with management. Additional information on securities transactions and the selections of securities dealers can be found in section 2126.1.

4. Ascertain whether policy objectives and/or position limits require prudence on the part of authorized personnel entering into these new activities. If discretion is left to senior

9. The Board's policy statement on engaging in futures, forwards, and option contracts.

managers, determine whether management has issued instructions to ensure that the level of financial-contract activity is prudent relative to the capabilities of persons authorized to execute and monitor contracts.

A new activity such as financial contracts should, as a general rule, be entered slowly. In developing expertise, management should mandate a low level of activity until persons authorized to execute contracts gain sufficient expertise or until new personnel are employed that have sufficient training and experience to engage in financial-contract activities on a larger scale. Senior management must develop the expertise to understand and evaluate techniques and strategies employed to ensure that an experienced professional does not engage in improper or imprudent activities.

5. If a banking organization uses financial contracts as part of its overall asset-liability management strategy, determine whether the organization developed an adequate system for evaluating its interest-rate risk.

   Without a system for identifying and measuring interest-rate risk, it is impossible to engage in hedging activity in an informed and meaningful manner. Failure to identify the mismatches in the organization's asset-liability mix would make it difficult to select the proper number and types of financial contracts—for example, bond or bill financial contracts—to provide an appropriate amount of interest-rate-risk protection. Evaluate whether the organization's interest-rate-risk measurement techniques appear reasonable to determine whether the financial contracts employed were successful in providing the proper amount of futures gains (losses) to cover the hedged risk position.

6. Determine if the recordkeeping system is sufficiently detailed to permit personnel to document and describe in detail how financial-contract positions taken have contributed to the attainment of the banking organization's stated objectives.

   There is no universal, adequate recordkeeping system for this purpose. Examiners must evaluate each individual system relative to the organization's stated objectives and activities. If the recordkeeping system cannot be used to illustrate how financial contracts contributed to the attainment of the banking organization's stated objectives, the recordkeeping system is inadequate. BHCs with inadequate recordkeeping systems should be instructed to make appropriate modifications.

7. Ascertain whether the banking organization's board of directors has established written limitations with respect to financial-contract positions.

   NOTE: The bank holding company policy statement requires that the board of directors establish written policies and position limitations in connection with financial-contract activities. If a committee has been delegated similar responsibilities within the organization, and a committee makes the decision, its recommendation should be ratified by the board of directors.

8. If there is the potential to exceed the above limitations in certain instances, determine whether there are firm, written procedures in place concerning the authorizations necessary to exceed limits.

9. Determine whether the board of directors, a duly authorized committee thereof, or internal auditors review at least monthly financial-contract positions to ascertain conformance with limitations. (See item (b) of the bank holding company policy statement.)

10. Determine if the banking organization maintains general-ledger memorandum accounts or commitment registers to adequately identify and control all financial-contract commitments to make or take delivery of securities or money market instruments.

11. Determine if the banking organization issues or writes option contracts expiring in excess of 150 days which give the other party to the contract the option to deliver securities to it.

    Examiners should review the facts surrounding standby contracts issued by holding companies. Examiners should also review accounting entries connected with bank holding company standby contracts to determine whether standbys were issued to earn fee income "up front" and exploit the lack of generally accepted accounting principles.

12. Determine whether financial-contract positions are properly disclosed in notes to the statements of financial condition and income and that the contract positions have been properly reported on FR Y-9C, Schedule HC-F, "Off-Balance-Sheet Items."

13. Determine whether the banking organization has implemented a system for monitoring credit-risk exposure associated with

various customers and dealers with whom operating personnel are authorized to transact business.

All financial-contract trading involves market risks. However, forward and OTC options trading, as well as swap activities, also involve credit risk. The key concern is whether the contra party to a transaction will be ready, willing, and able to perform on contract settlement and payment dates. While maintaining control over credit-risk exposure should ensure that a financial organization will not enter excessive (relative to the financial condition of the contra party) forward or standby contracts, monitoring such exposure may not prevent default in all instances.

14. Ascertain whether the banking organization has implemented internal controls and internal audit programs to ensure adherence to written policies and prevent unauthorized trading and other abuses.
15. Determine if the Reserve Bank was notified at the inception of bank holding company futures, forward, and option activities as required by paragraph (f) of the holding company policy statement (*Federal Reserve Regulatory Service* 4–830).
16. Determine if the personnel engaged in financial-contract activities have sufficient knowledge and understanding of the markets to perform those functions.

2130.0.13.1 Evaluating the Risks of Contract Activities

Evaluating the organization's stated objectives and their effects on overall risk is a difficult task involving legitimate cause for concern because of the high degree of leverage involved in contract activities. Although there is an emerging trend towards dealers requiring margin on forward trades, forward contract transactions generally have not required margin deposits, and thus, grant users unlimited leverage. Although the amount of margin required for futures trades is extremely small (for example, $1,500 initial margin to take a $1 million futures position), the rules of the exchanges do require a daily mark to market and a requirement that members of the futures exchanges meet maintenance margin calls on behalf of their customers. Customers, of course, are generally required to promptly reimburse brokers for margin posted on their behalf. Nevertheless, engaging in contract activities requires market participants to assume the market risks of either owning securities or ''shorting'' securities. Issuing (or selling) standby contracts granting the other party to the contract the option to deliver securities is a practice which results in the issuer functioning as an insurer against downside market risk for the other party; in essence, the party receiving the standby fee assumes all of the interest-rate risks of security ownership, but receives none of the benefits.

2130.0.13.2 Reviewing Financial-Contract Positions

The preceding questions were designed to focus the examiner's attention on a bank holding company's stated objectives for engaging in financial contract activities and the manner in which such activities are conducted. It is also vital to review position records with respect to financial contracts or, if necessary, prepare a schedule grouping similar contracts by maturity. Once the various positions have been scheduled it will be possible to evaluate the risk of contract positions relative to the organization under inspection.

2130.0.13.3 Factors to Consider in Evaluating Overall Risk

To determine whether contract positions are reasonable, an examiner must evaluate positions in light of certain key factors: the size of the organization, its capital structure, its business needs, and its capacity to fulfill its obligations. For example, open contracts to purchase $7 million of GNMA securities would be viewed differently in a BHC with $24 million of assets than in a BHC with $1 billion of assets.

There is no guaranty that financial contract prices and cash market prices will move in the same direction at the same velocity; however, contract prices and cash market prices ultimately move towards price convergence in the delivery month. Keeping this fact in mind, the risk evaluating process can be simplified by thinking of the securities underlying the various contracts as a frame of reference. For example, if a BHC holds ''long'' futures contracts on $10 million (par value) of Treasury bonds the examiner should first evaluate the effect (excluding tangible benefits of ownership, e.g., interest income, pledging, etc.) on the organization of holding $10 million of bonds in its portfolio and the resultant appreciation or depreciation if interest rates rise or fall by a given amount. A ''short'' contract of $10 million Treasury bonds would be evaluated as if the banking organization had executed a short sale for $10 million. In addition, the examiner would have to consider the positive or negative flow of funds received or disbursed as margin to reflect daily contract gains and losses. While commissions on futures contracts are not a major factor in hedging transactions, they also should be considered in this evaluation. Typically, commissions are charged on a ''round turn'' basis—meaning that commissions are charged based upon an assumption that each futures contract will be offset prior to maturity. Since each contract will have to be offset, or securities bought or delivered, it should be determined whether funds will be available to offset contracts or fund delivery. In the case of certain short contracts, a determination must be made as to whether deliverable securities are held or committed for purchase by the banking organization.

2130.0.13.4 Contract Liquidity

In addition to looking at the ''big picture,'' examiners should consider a position in a given contract maturity month relative to the volume of contracts outstanding. For example, in futures trading there is generally a greater open interest in the next contract maturity month and perhaps the following one or two contract maturity months. As one moves away from the near term contracts, there is generally less trading and less ''open interest'' in the more distant contracts. ''Open interest'' or the amount of contracts outstanding is reported in financial newspapers and other publications. Generally, the contracts with the largest open interest and daily trading volume are considered to be the most liquid.

To illustrate the concept discussed above, one should consider the following example. A ''red flag'' should be apparent if a contract review discloses that the organization has taken a sizeable position in a contract expiring in two years. When the examiner checks financial newspapers and other publications, he or she may discover that the BHC's position represents 20 percent of the open interest in that contract. Such a situation would clearly be unsafe and unsound because the relatively huge position coupled with the typically less liquid conditions in distant contracts makes it highly unlikely that the BHC could quickly close out its position if necessary. In addition, one should also question why the distant maturity was chosen since there is no immediate reason to expect a close correlation to the cash market for the underlying security.

With respect to forward contracts, there is an active forward market for GNMA securities specifying delivery of the underlying securities up to four or five months in the future. If a banking organization is executing contracts for more distant maturities, management should be queried as to why it is necessary to trade outside the normal trading cycle.

2130.0.13.5 Relationship to Banking Activities

In evaluating contract activities, examiners should verify that contract strategies are carried to fruition in connection with their relationship to overall objectives. Examiners may find it useful to recommend additional recordkeeping in borderline cases when they encounter situations where financial-contract positions are closed out frequently during the hedge period, but not frequently enough to be considered trading rather than hedging activities. Examiners should suggest proper documentation with regard to financial contracts executed and any additional recordkeeping as needed. Specifically, users could be requested to establish written criteria specifying what circumstances will trigger the closing of such contracts. Then users would be judged by how well they adhered to the criteria as well as whether the plan reduced risk. Hopefully, such recordkeeping would give users the latitude to close out a financial-contract position working against them (as determined by some prearranged benchmark), yet still require sufficient discipline to prevent users from selectively executing financial contracts merely to profit upon interest-rate forecasts.

The preceding discussion should reinforce the fact that the actual utilization of financial contracts is not a clear-cut issue in terms of hedging verses speculation. However, certain key concepts should be kept in mind. First, a decision to hedge with futures or forward contracts involves making a decision that one is content to lock in an effective cost of funds, a sale price of a specific asset, etc. However, the decision to hedge which gives downside protection also means forfeiting the benefits which would result from a favorable market movement. Thus, in evaluating hedge strategies, the organization should be judged as to whether it maintained hedge positions long enough to accomplish its objectives.

Caution should be employed in performing the analysis of financial contracts used to obtain targeted effective interest rates. Examiners should not evaluate transactions solely on a "paired" basis, that is, looking at paired cash market and financial-contract positions and forgetting about financial-contract positions relative to the organization's entire balance sheet, nor should examiners fail to review the overall nature of financial-contract activities. For example, individual opening and closing of financial contracts could appear reasonable, but the aggregate activities may be indicative of an organization that is in reality operating a futures trading account solely to profit on interest-rate expectations.

2130.0.13.6 Parties Executing or Taking the Contra Side of a Financial Contract

In addition to monitoring contra-party credit risk, serious efforts should be made to ensure that the banking organization carefully scrutinizes the selection of brokers and dealers. In the case of futures contracts, the Commodity Exchange Act requires that an entity functioning as a futures commission merchant be registered with the CFTC. However, not every FCM may be a member of a commodities exchange. Members of an exchange are given additional supervision by the exchange, while nonmembers are subject to audit by the National Futures Association. In selecting any broker or dealer, an organization should give careful consideration to its reputation, financial viability, and length of time in business. If an organization intends to deal with a newly established FCM or broker-dealer, special efforts should be made to verify the reputation and integrity of its principals. (For additional discussion, see *Federal Reserve Regulatory Service* 3–1562). Although such measures cannot ensure that problems will not subsequently develop with an FCM or broker-dealer, some careful forethought can tend to ensure that relationships will not be developed with persons or firms who had serious problems in the past.

2130.0.14 ACCOUNTING FOR FUTURES CONTRACTS

All futures contracts, except for foreign-currency futures contracts, shall be reported in the Consolidated Financial Statements for Bank Holding Companies in accordance with Financial Accounting Standards Board (FASB) Statement No. 80, "Accounting for Futures Contracts." Foreign-currency futures contracts shall be reported in accordance with the guidance in FASB Statement No. 52, "Foreign Currency Translation."

2130.0.14.1 Performance Bonds under Futures Contracts

When the reporting banking organization, as either buyer or seller of futures contracts, has posted a performance bond in the form of a margin account deposited with a broker or exchange, the current balance (as of the report date) of that margin account shall be reported in Other Assets. The balance in the margin account includes the following:

1. the original margin deposit, plus (less)
2. any additions (deductions) as a result of daily fluctuations in the market value of the related contracts (i.e., "variation margin"), plus
3. any additional deposits made to the account to meet margin calls or otherwise (i.e., "maintenance margin"), less
4. any withdrawals of excess balances from the account

When the performance bond takes the form of a pledge of assets with a broker rather than a margin account, the pledged assets shall be maintained on the books of the pledging banking organization and no other balance-sheet entry is made for the performance bond. In this case, gains and losses resulting from daily fluctuations in the market value of the related contracts are generally settled with the broker in cash. However, if the pledging banking organization also maintains a working balance with the broker against which recognized daily market gains and losses are posted, the working balance should be reported in Other Assets, and treated in the same manner as a margin account.

2130.0.14.2 Valuation of Open Positions

All open positions in futures contracts must be reviewed at least monthly (or more often, if material) and their current market values determined. The market value of a futures contract is to be based on published price quotations. These futures positions must be revalued at their current market values on these valuation dates and any changes in these values reported in accordance with the guidance presented below for hedge or nonhedge contracts, as appropriate.

2130.0.14.3 Criteria for Hedge-Accounting Treatment

A futures contract shall be accounted for as a hedge when the following conditions are met:

1. The banking organization must have determined that the item or group of items to be hedged (that is, the identifiable assets, liabilities, firm commitments, or anticipated transactions) will expose it to price or interest-rate risk.
2. The futures contract must reduce the exposure to risk. This will be demonstrated if, at the inception of the hedge and *throughout the hedge period, high correlation* is expected to exist between the changes in the prices of both the contract and the hedged item or group of items.[10] In other words, the banking organization must monitor the price movements of both the hedge contract and the hedged items to determine that it is probable that changes in the market value of the futures contract will offset the effects of price changes on the hedged items.
3. The futures contract must be designated in writing as a hedge by management at the inception of the hedge.

   In order for a futures contract to qualify as a hedge of an anticipated transaction, the following two additional criteria must be met:

   a. The significant characteristics and expected terms of the anticipated transaction must be identified.
   b. The occurrence of the anticipated transaction must be probable.[11]

2130.0.14.4 Gains and Losses from Monthly Contract Valuations of Futures Contracts That Qualify as Hedges

If the hedge criteria are met, the accounting for the futures contract shall be related to the accounting for the hedged item so that changes in the market value of the futures contract are recognized in income when the effects of related changes in the price or interest rate of the hedged item are recognized. If a banking organization must include unrealized changes in the fair value of a hedged item in income, a change in the market value of the related futures contract shall be recognized in income when the change occurs. Otherwise, a change in the market value of a futures contract that qualifies as a hedge of an existing asset or liability shall be recognized as an adjustment of the carrying amount of the hedged item. A change in the market value of a futures contract that is a hedge of a firm commitment shall be included in the measurement of the transaction that satisfies the commitment. A change in the market value of a futures contract that is a hedge of an anticipated transaction shall be included in the measurement of the subsequent transaction.

Once the carrying amount of an asset or liability has been adjusted for the change in the market value of a futures contract, the adjustment must be recognized in income in the same manner as other components of the carrying amount of that asset or liability (for example, using the interest method). If the item being hedged is an interest-bearing financial instrument otherwise reported at amortized historical cost, then the changes in the market value of the hedge contract that have been reflected as adjustments in the carrying amount of the financial instrument shall be amortized as an adjustment of interest income or expense over the expected remaining life of the hedged item.

If a futures contract that has been accounted for as a hedge of an anticipated transaction is closed before the date of the related transaction, the accumulated change in value of the contract shall be carried forward (assuming high correlation continues to exist) and included in the measurement of the related transaction. When it becomes probable that the quantity of the anticipated transaction will be less than that originally hedged, a pro rata portion of the futures results that would have been included in the measurement of the transaction shall be recognized as a gain or loss.

When futures contracts that are hedges are terminated, the gain or loss on the terminated contracts must be deferred and amortized over the remaining life of the hedged item.

10. Generally, banking practice maintains that correlation in the changes in the market values of the futures contract and the hedged item must be at least 80 percent for the ''high correlation'' criteria in FASB Statement No. 80 to be met.

11. It will be particularly difficult to meet this criteria when an anticipated transaction is not expected to take place in the near future.

2130.0.14.5 Gains and Losses from Monthly Contract Valuations of Futures Contracts That Do Not Qualify as Hedges

For futures contracts that are not accounted for as hedges, the change that has occurred in the market value of open positions since the last call report date shall be reflected in current income, either as ''other noninterest income'' for net gains or ''other noninterest expense'' for net losses.

If high correlation ceases to exist, the banking organization should discontinue accounting for a futures contract as a hedge. When this occurs, the portion of the change in the market value of the contract that has not offset the market value changes of the hedged item, since the inception of the hedge, must be reflected in the Report of Income as ''other noninterest income'' or ''other noninterest expense,'' as appropriate. The contract should thereafter be accounted for as a nonhedge contract with subsequent changes in the contract's market value reflected in current period income.

When futures contracts that are not hedges are terminated, the gain or loss on the terminated contract must be recognized currently in the Report of Income as ''other noninterest income'' or ''other noninterest expense,'' as appropriate.

There is the potential for holding companies and nonbank subsidiaries to follow the referenced accounting applications and break ''hedges'' with unrealized futures gains to recognize income, and maintain hedges with futures losses and adjust the carrying basis of the paired, that is, ''hedged'' asset. Examiners should look for patterns of taking gains and losses with a view to determining whether the opening and closing of contracts is consistent with the organization's risk-reducing strategies.

2130.0.15 PREPARING INSPECTION REPORTS

Unsatisfactory comments pertaining to a bank holding company's financial-contract activities should be noted on the ''Examiner's Comments,'' ''Policies and Supervision,'' and ''Analysis of Financial Factors'' or other appropriate page depending on the severity of the comments within the bank holding company inspection report.

2130.0.16 INTERNAL CONTROLS AND INTERNAL AUDIT

The following is designed to illustrate desirable internal controls and internal audit procedures applicable to the organization's activities in financial contracts. This illustration is not intended to serve as an absolute standard relating to contract activities, but is designed to supplement examiners' knowledge relating to internal controls and internal audits in this context. In evaluating internal controls and audits, the examiner will need to evaluate the scope of futures, forward, and options activities to determine whether internal controls and audit procedures are adequate in relation to the volume and nature of the activities.

2130.0.16.1 Internal Controls

It is a management's responsibility to minimize the risks inherent in financial-contract activities through the establishment of policies and procedures covering organizational structure, segregation of duties, operating and accounting system controls, and comprehensive management reporting. Formal written procedures should be in place in connection with purchases and sales, processing, accounting, clearance and safekeeping activities relating to these transactions. In general, these procedures should be designed to ensure that all financial contracts are properly recorded and that senior management is aware of the exposure and gains or losses resulting from these activities. Some examples of desirable controls follow:

1. Written documentation indicating what types of contracts are eligible for purchase by the organization, which individual persons are eligible to purchase and sell contracts, which individual persons are eligible to sign contracts or confirmations, and the names of firms or institutions with whom employees are authorized to conduct business.
2. Written position limitations for each type of contract established by the banking organization's board of directors and written procedures for authorizing trades, if any, in excess of those limits.
3. A system to monitor the organization's exposure with customers and those broker-dealers and institutions eligible to do business with it. To implement this, management must determine the amount of credit risk permissible with various parties and then institute surveillance procedures to ensure

that such limits are not exceeded without written authorization from senior management.

4. Separation of duties and supervision to ensure that persons executing transactions are not involved in approving the accounting media and/or making accounting entries. Further, persons executing transactions should not have authority to sign incoming or outgoing confirmations or contracts, reconcile records, clear transactions, or control the disbursement of margin payments.
5. A clearly defined flow of order tickets and confirmations. Confirmations generated should, preferably, be prenumbered. In addition to promptly recording all commitments in a daily written commitment ledger, the related documentation should be filed separately for purposes of audit and examination. The flow of confirmations and order tickets should be designed to verify accuracy and enable reconciliations throughout the system, for example, to ensure that a person could not execute unauthorized transactions and bypass part of the accounting system, and to enable the reconcilement of traders' position reports to those positions maintained by an operating unit.
6. Procedures to route incoming confirmations to an operations unit separate from the trading unit. Confirmations received from brokers, dealers, or others should be compared to confirmations (or other control records) prepared by the banking organization to ensure that it will not accept or make delivery of securities, or remit margin payments, pursuant to contracts unless there is proper authorization and documentation.
7. Procedures for promptly resolving fails to receive or fails to deliver securities on the date securities are due to be received or sent pursuant to contracts.
8. Procedures for resolving customer complaints by someone other than the person who executed the contract.
9. Procedures for verifying brokers' reports of margin deposits and contract positions (use an outside pricing source), and reconciling such reports to the records.
10. Procedures for daily review of outstanding contracts and supervision of traders. In addition, there should be periodic reports to management reflecting the margin deposits and contract positions.
11. Selecting and training competent personnel to follow the written policies and guidelines.

2130.0.16.2 Internal Audit

The scope and frequency of the internal audit program should be designed to review the internal control procedures and verify that the internal controls purported to be in effect are being followed. Further, the internal auditor should verify that there are no material inadequacies in the internal control procedures that would permit a person acting individually to perpetrate errors or irregularities involving the records of the organization or assets that would not be detected by the internal control procedures in time to prevent material loss or misstatement of the banking organization's financial statements or serious violation of applicable banking, bank holding company, or securities rules or regulations. Any weaknesses in internal control procedures should be reported to management, along with recommendations for corrective action. If internal auditors do not report to an audit committee, the person to whom they report should not be in a position to misappropriate assets. In addition, auditors should occasionally spot-check contract prices and mark-to-market adjustments.

2130.0.17 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

Financial institutions, including bank holding company subsidiaries, are lending securities with increasing frequency, and, in some instances, a financial institution may lend its own investment or trading-account securities. Financial institutions lend customers' securities held in custody, safekeeping, trust, or pension accounts. Because the securities available for lending often greatly exceed the demand for them, inexperienced lenders may be tempted to ignore commonly recognized safeguards. Bankruptcies of broker-dealers have heightened regulatory sensitivity to the potential for problems in this area.

2140.0.1 SECURITIES-LENDING MARKET

Securities brokers and commercial banks are the primary borrowers of securities. They borrow securities to cover securities fails (securities sold but not available for delivery), short sales, and option and arbitrage positions. Securities lending, which used to involve principally corporate equities and debt obligations, increasingly involves loans of large blocks of U.S. government and federal-agency securities.

Securities lending is conducted through open-ended ''loan'' agreements, which may be terminated on short notice by the lender or borrower. Repurchase agreements are generally used by owners of securities as financing vehicles and, in certain respects, are closely analogous to securities lending. The objective of securities lending, however, is to receive a safe return in addition to the normal interest or dividends. Securities loans in industry practice are generally collateralized by U.S. government or federal-agency securities, cash, or letters of credit.[1] At the outset, each loan is collateralized at a predetermined margin. If the market value of the collateral falls below an acceptable level during the time a loan is outstanding, a margin call is made by the lender institution. If a loan becomes over-collateralized because of appreciation of collateral or market depreciation of a loaned security, the borrower usually has the opportunity to request the return of any excessive margin.

When a securities loan is terminated, the securities are returned to the lender and the collateral to the borrower. Fees received on securities loans are divided between the lender and the customer account that owns the securities. In situations involving cash collateral, part of the interest earned on the temporary investment of cash is returned to the borrower, and the remainder is divided between the lender and the customer account that owns the securities.

1. Broker-dealers borrowing securities are subject to the restrictions of the Federal Reserve's Regulation T (12 C.F.R. 220.10), which specifies acceptable borrowing purposes.

2140.0.2 DEFINITIONS OF CAPACITY

Securities lending may be done in various capacities and with differing associated liabilities. It is important that all parties involved understand in what capacity the lender is acting. For the purposes of these guidelines, the relevant capacities are as follows:

1. *Principal.* A lender offering securities from its own account is acting as principal. A lender institution offering customers' securities on an undisclosed basis is also considered to be acting as principal.
2. *Agent.* A lender offering securities on behalf of a customer-owner is acting as an agent. For the lender to be considered a bona fide or ''fully disclosed'' agent, it must disclose the names of the borrowers to the customer-owners (or give notice that names are available upon request), and must disclose the names of the customer-owner to borrowers (or give notice that names are available upon request). In all cases, the agent's compensation for handling the transaction should be disclosed to the customer-owner. Undisclosed agency transactions, that is, ''blind brokerage'' transactions in which participants cannot determine the identity of the contra party, are treated as if the lender was the principal.
3. *Directed agent.* A lender which lends securities at the direction of the customer-owner is acting as a directed agent. The customer directs the lender in all aspects of the transaction, including to whom the securities are loaned, the terms of the transaction (rebate rate and maturity/call provisions on the loan), acceptable collateral, investment of any cash collateral, and collateral delivery.
4. *Fiduciary.* A lender which exercises *discretion* in offering securities on behalf of and for the benefit of customer-owners is acting as a fiduciary. For purposes of these guidelines,

the underlying relationship may be as agent, trustee, or custodian.

5. *Finder.* A finder brings together a borrower and a lender of securities for a fee. Finders do not take possession of the securities or collateral. Delivery of securities and collateral is direct between the borrower and the lender, and the finder does not become involved. The finder is simply a fully disclosed intermediary.

2140.0.3 GUIDELINES

All bank holding companies or their subsidiaries that participate in securities lending should establish written policies and procedures governing these activities. Other than commercial banks with trust departments, the bank holding company subsidiaries most likely to be engaged in securities lending are non-deposit-taking trust companies and certain discount brokers which provide custody services and make margin loans. At a minimum, policies and procedures should cover each of the topics in these guidelines.

2140.0.3.1 Recordkeeping

Before establishing a securities-lending program, a financial firm or institution must establish an adequate recordkeeping system. At a minimum, the system should produce daily reports showing which securities are available for lending, and which are currently lent, outstanding loans by borrower, outstanding loans by account, new loans, returns of loaned securities, and transactions by account. These records should be updated as often as necessary to ensure that the lender institution fully accounts for all outstanding loans, that adequate collateral is required and maintained, and that policies and concentration limits are being followed.

2140.0.3.2 Administrative Procedures

All securities lent and all securities standing as collateral must be marked to market daily. Procedures must ensure that any necessary calls for additional margin are made on a timely basis.

In addition, written procedures should outline how to choose the customer account that will be the source of lent securities when they are held in more than one account. Possible methods include loan volume analysis, automated queue, a lottery, or some combination of these. Securities loans should be fairly allocated among all accounts participating in a securities-lending program.

Internal controls should include operating procedures designed to segregate duties and timely management reporting systems. Periodic internal audits should assess the accuracy of accounting records, the timeliness of management reports, and the lender's overall compliance with established policies and the firm's procedures.

2140.0.3.3 Credit Analysis and Approval of Borrowers

In spite of strict standards of collateralization, securities-lending activities involve risk of loss. Such risks may arise from malfeasance or failure of the borrowing firm or institution. Therefore, a duly established management or supervisory committee of the lender should formally approve, in advance, transactions with any borrower.

Credit and limit approvals should be based upon a credit analysis of the borrower. A review should be performed before establishing such a relationship and reviews should be conducted at regular intervals thereafter. Credit reviews should include an analysis of the borrower's financial statement, and should consider capitalization, management, earnings, business reputation, and any other factors that appear relevant. Analyses should be performed in an independent department of the lender, by persons who routinely perform credit analyses. Analyses performed solely by the person(s) managing the securities-lending program are not sufficient.

2140.0.3.4 Credit and Concentration Limits

After the initial credit analysis, management of the lender should establish an individual credit limit for the borrower. That limit should be based on the market value of the securities to be borrowed, and should take into account possible temporary (overnight) exposures resulting from a decline in collateral values or from occasional inadvertent delays in transferring collateral. Credit and concentration limits should take into account other extensions of credit by the lender to the same borrower or related interests.

Procedures should be established to ensure that credit and concentration limits are not exceeded without proper authorization from management.

2140.0.3.5 Collateral Management

Securities borrowers generally pledge and maintain collateral at a level equal to at least 100 percent of the value of the securities borrowed.[2] The minimum amount of excess collateral, or ‘‘margin,’’ acceptable to the lender should relate to price volatility of the loaned securities and the collateral (if other than cash).[3] Generally, the minimum initial collateral on securities loans is at least 102 percent of the market value of the lent securities plus, for debt securities, any accrued interest.

Collateral must be maintained at the agreed margin. A daily ‘‘mark-to-market’’ or valuation procedure must be in place to ensure that calls for additional collateral are made on a timely basis. The valuation procedures should take into account the value of accrued interest on debt securities.

Securities should not be lent unless collateral has been received or will be received simultaneously with the loan. As a minimum step toward perfecting the lender’s interest, collateral should be delivered directly to the lender or an independent third-party trustee.

2140.0.3.6 Cash as Collateral

When cash is used as collateral, the lender is responsible for making it income productive. Lenders should establish written guidelines for selecting investments for cash collateral. Generally, a lender will invest cash collateral in repurchase agreements, master notes, a short-term investment fund (STIF), U.S. or Eurodollar certificates of deposit, commercial paper, or some other type of money market instrument. If the lender is acting in any capacity other than as principal, the written agreement authorizing the lending relationship should specify how cash collateral is to be invested.

Using cash collateral to pay for liabilities of the lender or its holding company would be an improper *conflict of interest* unless that strategy was specifically authorized in writing by the owner of the lent securities.

2140.0.3.7 Letters of Credit as Collateral

If a lender plans to accept letters of credit as collateral, it should establish guidelines for their use. Those guidelines should require a credit analysis of the banks issuing the letter of credit before securities are lent against that collateral. Analyses must be periodically updated and reevaluated. The lender should also establish concentration limits for the banks issuing letters of credit, and procedures should ensure they are not exceeded. In establishing concentration limits on letters of credit accepted as collateral, the lender’s total outstanding credit exposures from the issuing bank should be considered.

2140.0.3.8 Written Agreements

Securities should be lent only pursuant to a written agreement between the lender and the owner of the securities, specifically authorizing the institution to offer the securities for loan. The agreement should outline the lender’s authority to reinvest cash collateral (if any) and responsibilities with regard to custody and valuation of collateral. In addition, the agreement should detail the fee or compensation that will go to the owner of the securities in the form of a fee schedule or other specific provision. Other items which should be covered in the agreement have been discussed earlier in these guidelines.

A lender must also have written agreements with the parties who wish to borrow securities. These agreements should specify the duties and responsibilities of each party. A written agreement may detail acceptable types of collateral (including letters of credit); standards for collateral custody and control, collateral valuation and initial margin, accrued interest, marking to market, and margin calls; methods for transmitting coupon or dividend payments received if a security is on loan on a payment date; conditions which will trigger the termination of a loan (including events of default); and acceptable

2. Employee benefit plans subject to the Employee Retirement Income Security Act are specifically required to collateralize securities loans at a minimum of 100 percent of the market value of loaned securities (see section 2140.0.3.10 below).

3. The level of margin should be dictated by level of risk being underwritten by the securities lender. Factors to be considered in determining whether to require margin above the recommended minimum include the type of collateral, the maturity of collateral and lent securities, the term of the securities loan, and the costs which may be incurred when liquidating collateral and replacing loaned securities.

methods of delivery for loaned securities and collateral.

2140.0.3.9 Use of Finders

Some lenders may use a finder to place securities, and some financial institutions may act as finders. A finder brings together a borrower and a lender for a fee. Finders should not take possession of securities or collateral. The delivery of securities loaned and collateral should be direct between the borrower and the lender. A finder should not be involved in the delivery process.

The finder should act only as a fully disclosed intermediary. The lender must always know the name and financial condition of the borrower of any securities it lends. If the lender does not have that information, it and its customers are exposed to unnecessary risks.

Written policies should be in place concerning the use of finders in a securities-lending program. These policies should cover circumstances in which a finder will be used, which party pays the fee (borrower or lender), and which finders the lender institution will use.

2140.0.3.10 Employee Benefit Plans

The Department of Labor has issued two class exemptions which deal with securities-lending programs for employee benefit plans covered by the Employee Retirement Income Security Act (ERISA): Prohibited Transaction Exemption 81-6 (46 FR 7527 (January 23, 1981) and correction (46 FR 10570 (February 3, 1981))), and Prohibited Transaction Exemption 82-63 (47 FR 14804 (April 6, 1982)). The exemptions authorize transactions which might otherwise constitute unintended ‘‘prohibited transactions’’ under ERISA. Any firm engaged in the lending of securities for an employee benefit plan subject to ERISA should take all steps necessary to design and maintain its program to conform with these exemptions.

Prohibited Transaction Exemption 81-6 permits the lending of securities owned by employee benefit plans to persons who could be ‘‘parties in interest’’ with respect to such plans, provided certain conditions specified in the exemption are met. Under those conditions, neither the borrower nor an affiliate of the borrower can have discretionary control over the investment of plan assets, or offer investment advice concerning the assets, and the loan must be made pursuant to a written agreement. The exemption also establishes a minimum acceptable level for collateral based on the market value of the loaned securities.

Prohibited Transaction Exemption 82-63 permits compensation of a fiduciary for services rendered in connection with loans of plan assets that are securities. The exemption details certain conditions which must be met.

2140.0.3.11 Indemnification

Certain lenders offer participating accounts indemnification against losses in connection with securities-lending programs. Such indemnifications may cover a variety of occurences including all financial loss, losses from a borrower default, or losses from collateral default. Lenders that offer such indemnification should obtain a legal opinion from counsel concerning the legality of their specific form of indemnification under federal and/or state law.

A lender which offers an indemnity to its customers may, in light of other related factors, be assuming the benefits and, more importantly, the liabilities of a principal. Therefore, lenders offering indemnification should also obtain written opinions from their accountants concerning the proper financial statement disclosure of their actual or contingent liabilities.

2140.0.4 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Securities Lending policy statement of the Federal Financial Institutions Examination Council, adopted by the Federal Reserve Board on May 6, 1985			3–1579.5	

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Depository institutions and others involved with the purchase of United States Government and Agency obligations under agreements to resell (reverse repurchase agreements),[2] have sometimes incurred significant losses. The most important factors causing these heavy losses have been inadequate credit risk management and the failure to exercise effective control over securities collateralizing the transactions.[3]

The following minimum guidelines address the need for managing credit risk exposure to counterparties under securities repurchase agreements and for controlling the securities in those transactions, and should be followed when entering into repurchase agreements with securities dealers and others.

Depository institutions and nonbank subsidiaries that actively engage in repurchase agreements are encouraged to have more comprehensive policies and controls to suit their particular circumstances. The examining staffs of the Federal Reserve should review written policies and procedures of dealers to determine their adequacy in light of these minimum guidelines and the scope of each subsidiary's operations.

2150.0.1 CREDIT POLICY GUIDELINES

The apparent safety of short-term repurchase agreements which are collateralized by highly liquid, U.S. Government and Federal agency obligations has contributed to an attitude of complacency. Some portfolio managers have underestimated the credit risk associated with the performance of the counterparty to the transactions, and have not taken adequate steps to assure control of the securities covered by the agreement.

All firms that engage in securities repurchase agreement transactions should establish written credit policies and procedures governing these activities. At a minimum, those policies and procedures should cover the following:

Written policies should establish ''know your counterparty'' principles. Engaging in repurchase agreement transactions in volume and in large dollar amounts frequently requires the services of a counterparty who is a dealer in the underlying securities. Some firms which deal in the markets for U.S. Government and Federal agency securities are subsidiaries of, or related to, financially stronger and better known firms. However, these stronger firms may be independent of their U.S. Government securities subsidiaries and affiliates and may not be legally obligated to stand behind the transactions of related companies. Without an express guarantee, the stronger firm's financial position cannot be relied upon in assessing the creditworthiness of a counterparty.

It is important to know the legal entity that is the actual counterparty to each repurchase agreement transaction. Know about the actual counterparty's character, integrity of management, activities, and the financial markets in which it deals. Be particularly careful in conducting repurchase agreements with any firm that offers terms that are significantly more favorable than those currently prevailing in the market.

In certain situations firms may use, or serve as, brokers or finders in order to locate repurchase agreement counterparties or particular securities. When using or acting as this type of agent the names of each counterparty should be fully disclosed. Do not enter into undisclosed agency or ''blind brokerage'' repurchase transactions in which the counterparty's name is not disclosed.

2150.0.1.1 Dealings with Unregulated Securities Dealers

A dealer in U.S. Government and Federal agency obligations is not necessarily a Federally insured bank or thrift, or a broker/dealer registered with the Securities and Exchange Commission. Therefore, the dealer firm may not

1. A repurchase agreement is a transaction involving the *sale* of assets by one party to another, subject to an agreement by the seller to repurchase the assets at a specified date or in specified circumstances.

2. In order to avoid confusion among market participants who sometimes use the same term to describe different sides of the same transaction, the term ''repurchase agreement'' will be used in the balance of this statement to refer to both repurchase and reverse repurchase agreements. A repurchase agreement is one in which a party that owns securities acquires funds by transferring the securities to another party under an agreement to repurchase the securities at an agreed upon future date. A reverse repurchase (resale) agreement is one in which a party provides funds by acquiring securities pursuant to an agreement to resell them at an agreed upon future date.

3. Throughout this document repurchase agreements are generally discussed in terms of secured credit transactions. This usage should not be deemed to be based upon a legal determination.

be subject to any Federal regulatory oversight.

A firm doing business with an unregulated securities dealer should be certain that the dealer voluntarily complies with the Federal Reserve Bank of New York's minimum capital guideline, which currently calls for liquid capital to exceed measured risk by 20 percent (that is, the ratio of a dealer's liquid capital to risk of 1.2:1). This ratio can be calculated by a dealer using either the Securities and Exchange Commission's Net Capital Rule for Brokers and Dealers (Rule 15c31) or the Federal Reserve Bank of New York's Capital Adequacy Guidelines for United States Government Securities Dealers. To ensure that an unregulated dealer complies with either of those capital standards, it should certify its compliance with the capital standard and provide the following three forms of certification:

1. A letter of certification from the dealer that the dealer will adhere on a continuous basis to the capital adequacy standard;
2. Audited financial statements which demonstrate that as of the audit date the dealer was in compliance with the standard and the amount of liquid capital; and
3. A copy of a letter from the firm's certified public accountant stating that it found no material weaknesses in the dealer's internal systems and controls incident to adherence to the standard.[4]

Periodic evaluations of counterparty creditworthiness should be conducted by individuals who routinely make credit decisions and who are not involved in the execution of repurchase agreement transactions.

Prior to engaging in initial transactions with a new counterparty, obtain audited financial statements and regulatory filings (if any) from counterparties, and insist that similar information be provided on a periodic and timely basis in the future. Recent failures of government securities dealers have typically been foreshadowed by delays in producing these statements. Many firms are registered with the Securities and Exchange Commission as broker/dealers and have to file financial statements and should be willing to provide a copy of these filings.

The counterparty credit analysis should consider the financial statements of the entity that is to be the counterparty as well as those of any related companies that could have an impact on the financial condition of the counterparty. When transacting business with a subsidiary, consolidated financial statements of a parent are not adequate. Repurchase agreements should not be entered into with any counterparty that is unwilling to provide complete and timely disclosure of its financial condition. As part of this analysis, the firm should make inquiry about the counterparty's general reputation and whether there have been any formal enforcement actions against the counterparty or its affiliates by State or Federal securities regulators.

Maximum position and temporary exposure limits for each approved counterparty should be established based upon credit analysis performed. Periodic reviews and updates of those limits are necessary.

Individual repurchase agreement counterparty limits should consider overall exposure to the same or related counterparty. Repurchase agreement counterparty limitations should include the overall permissible dollar positions in repurchase agreements, maximum repurchase agreement maturities and limits on temporary exposure that may result from decreases in collateral values or delays in receiving collateral.

2150.0.2 GUIDELINES FOR CONTROLLING REPURCHASE AGREEMENT COLLATERAL

Repurchase agreements can be a useful asset and liability management tool, but repurchase agreements can expose a firm to serious risks if they are not managed appropriately. It is possible to reduce repurchase agreement risk by negotiating written agreements with all repurchase agreement counterparties and custodian banks. Compliance with the terms of these written agreements should be monitored on a daily basis. If prudent management control requirements of repurchase agreements are too burdensome, other asset/liability management tools should be used.

The marketplace perceives repurchase agreement transactions as similar to lending transactions collateralized by highly liquid Government securities. However, experience has shown that the collateral securities will probably *not* serve as protection if the counterparty becomes insolvent or fails, and the purchasing firm does not have control over the securities. Ultimate responsibility for establishing adequate control procedures rests with management of the firm. Management should obtain a written legal opin-

4. This letter should be similar to that which must be given to the SEC by registered broker/dealers.

ion as to the adequacy of the procedures utilized to establish and protect the firm's interest in the underlying collateral.

A written agreement specific to a repurchase agreement transaction or master agreement governing all repurchase agreement transactions should be entered into with each counterparty. The written agreement should specify all the terms of the transaction and the duties of both the buyer and seller. Senior managers should consult legal counsel regarding the content of the repurchase and custodial agreements. The repurchase and custodial agreements should specify, but should not be limited to, the following:

- Acceptable types and maturities of collateral securities;
- Initial acceptable margin for collateral securities of various types and maturities
- Margin maintenance, call, default and sellout provisions;
- Rights to interest and principal payments;
- Rights to substitute collateral; and
- The persons authorized to transact business on behalf of the firm and its counterparty.

2150.0.2.1 Confirmations

Some repurchase agreement confirmations may contain terms that attempt to change the firm's rights in the transaction. The firm should obtain and compare written confirmations for each repurchase agreement transaction to be certain that the information on the confirmation is consistent with the terms of the agreement. The confirmation should identify specific collateral securities.

2150.0.2.2 Control of Securities

As a general rule, a firm should obtain possession or control of the underlying securities and take necessary steps to protect its interest in the securities. The legal steps necessary to protect its interest may vary with applicable facts and law and accordingly should be undertaken with the advice of counsel. Additional prudential management controls may include:

- delivery of either physical securities to, or in the case of book entry securities, making appropriate entries in the books of a third party custodian designated under a written custodial agreement which explicitly recognizes the firm's interest in the securities as superior to that of any other person; or
- appropriate entries on the books of a third party custodian acting pursuant to a tripartite agreement with the firm and the counterparty, ensuring adequate segregation and identification of either physical or book-entry securities.

Where control of the underlying securities is not established, the firm may be regarded only as an unsecured general creditor of the insolvent counterparty. In such instance, *substantial losses are likely to be incurred.* Accordingly, a firm should not enter into a repurchase agreement without obtaining control of the securities unless all of the following minimum procedures are observed: (1) it is completely satisfied as to the creditworthiness of the counterparty; (2) the transaction is within credit limitations that have been pre-approved by the board of directors, or a committee of the board, for unsecured transactions with the counterparty; (3) periodic credit evaluations of the counterparty are conducted; and (4) the firm has ascertained that collateral segregation procedures of the counterparty are adequate. Unless prudential internal procedures of these types are instituted and observed, the firm may be cited for engaging in unsafe or unsound practices.

All receipts and deliveries of either physical or book-entry securities should be made according to written procedures, and third party deliveries should be confirmed in writing directly by the custodian. It is not acceptable to receive confirmation from the counterparty that the securities are segregated in a firm's name with a custodian; the firm should, however, obtain a copy of the advice of the counterparty to the custodian requesting transfer of the securities to the firm. Where securities are to be delivered, payment for securities should not be made until the securities are actually delivered to the firm or its agent. The custodial contract should provide that the custodian takes delivery of the securities subject to the exclusive direction of the firm.

Substitution of securities should not be allowed without the prior consent of the firm. The firm should give its consent before the delivery of the substitute securities to it or a third party custodian. Any substitution of securities should take into consideration the following discussion of "margin requirements."

2150.0.2.3 Margin Requirements

The amount paid under the repurchase agreement should be less than the market value of the securities, including the amount of any accrued interest, with the difference representing a predetermined margin. Factors to be considered in establishing an appropriate margin include the size and maturity of the repurchase transaction, the type and maturity of the underlying securities, and the creditworthiness of the counterparty. Margin requirements on U.S. Government and Federal agency obligations underlying repurchase agreements should allow for the anticipated price volatility of the security until the maturity of the repurchase agreement. Less marketable securities may require additional margin to compensate for less liquid market conditions. Written repurchase agreement policies and procedures should require daily mark-to-market of repurchase agreement securities to the bid side of the market. Repurchase agreements should provide for additional securities or cash to be placed with the firm or its custodian bank to maintain the margin within the predetermined level.

Margin calculations should also consider accrued interest on underlying securities and the anticipated amount of accrued interest over the term of the repurchase agreement, the date of interest payment and which party is entitled to receive the payment. In the case of pass-through securities, anticipated principal reductions should also be considered when determining margin adequacy.

Prudent management procedures should be followed in the administration of any repurchase agreement. Longer term repurchase agreements require management's daily attention to the effects of securities substitutions, margin maintenance requirements (including consideration of any coupon interest or principal payments) and possible changes in the financial condition of the counterparty. Engaging in open repurchase agreement transactions without maturity dates may be regarded as an unsafe and unsound practice unless the firm has retained rights to terminate the transaction quickly to protect itself against changed circumstances. Similarly, automatic renewal of short-term repurchase agreement transactions without reviewing collateral values and adjusting collateral margin may be regarded as an unsafe and unsound practice. If additional margin is not deposited when required, the firm's rights to sell securities or otherwise liquidate the repurchase agreement should be exercised without hesitation.

2150.0.2.4 Overcollateralization

A firm should use current market values, including the amount of any accrued interest, to determine the price of securities that are sold under repurchase agreements. Counterparties should not be provided with excessive margin. Thus, the written repurchase agreement contract should provide that the counterparty must make additional payment or return securities if the margin exceeds agreed upon levels. When acquiring funds under repurchase agreements it is prudent business practice to keep at a reasonable margin the difference between the market value of the securities delivered to the counterparty and the amount borrowed. The excess market value of securities sold may be viewed as an unsecured loan to the counterparty subject to the unsecured lending limitations for the firm and should be treated accordingly for credit policy and control purposes.

2150.0.3 OPERATIONS

A firm's operational functions should be designed to regulate the custody and movement of securities and to adequately account for trading transactions. Because of the dollar volume and speed of trading activities, operational inefficiencies can quickly result in major problems.

In some cases, a firm may not receive or deliver a security by settlement date. When a firm fails to receive a security by the settlement date, a liability exists until the transaction is consummated or cancelled. When the security is not delivered to the contra-party by settlement date, a receivable exists until that ''fail'' is resolved. ''Fails'' to deliver for an extended time, or a substantial number of cancellations, are sometimes characteristic of poor operational control or questionable trading activities.

Fails should be controlled by prompt reporting and follow-up procedures. The use of multicopy confirmation forms enables operational personnel to retain and file a copy by settlement date and should allow for prompt fail reporting and resolution.

2150.0.4 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Federal Financial Institutions Examination Council policy statement, adopted by the Federal Reserve Board on November 12, 1985, on repurchase agreements			3–1579	

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Risk management is an important responsibility of any bank holding company. The objective of this responsibility is to determine and limit the extent of the holding company organization's vulnerability to uncontrollable variables. While all companies perform risk evaluation in some form and exercise some degree of control over its magnitude, the precise processes used differ considerably across organizations in terms of formality, extensiveness, and effectiveness. It should be recognized that many organizations have only an implicit risk evaluation process, and that it may be appropriate to recommend that this process be formalized. Ultimately, the board of directors of the parent company should be held accountable for the consolidated risk evaluation and control.

Risk management at any level involves two basic elements: evaluation and control. Risk evaluation involves three steps: determination of exposures; specification of uncontrollable variables that have an impact on each exposure; and quantification of the expected effect of each variable on exposure. After the extent of existing or potential risk is determined, decisions to limit or control risk are made. This procedure is ever present, since most transactions create exposure, and every exposure has some element of risk. The following two sections discuss the risk evaluation and the risk control processes in very broad terms in an attempt to provide a framework that can be applied to most organizations.

2160.0.1 RISK EVALUATION

The risk identification process begins with a determination of exposures that an institution has to the environment.

Exposure conceptually occurs in every transaction undertaken by a banking organization. Because of the magnitude of the list of potential exposures, institutions generally limit their efforts to extremely large exposures, to areas where losses appear likely, and to activities where the market is changing and new exposures are created. The size of an exposure generally is dependent on the size of a transaction. This is true both for transactions recorded on accounting balance sheets and for those which occur off balance sheet. Exposure is not necessarily determined by the likelihood of loss. For example, many holding company organizations have a large "exposure" in Treasury bills, but do not consider these transactions to be risky.

The list of exposures that banks commonly identify has increased dramatically in the past decade. Historically, the primary focus has been on the exposure of the loan portfolio centering on the financial security of each individual loan; recently industry and geographical exposure of loans has increased in importance. The exposure of fixed assets, such as buildings, to fires, floods and other problems also has been recognized. In more recent years, exposure of mismatched maturities of assets and liabilities to interest rate movements has increased in importance as interest-rate movements have sharply fluctuated. While this exposure had always existed, it had not been recognized as particularly dangerous until recently. Another example of an exposure that historically was considered safe is repurchase agreements backed by government securities. When Drysdale Government Securities, Inc. failed, several risks were brought to light—whether the instrument is a loan (that would be tied up in case of bankruptcy) or a sale and potential liability when serving as an agent of a government securities firm that fails. A particularly difficult area to evaluate is exposure to legal action. For example, a suit against a bank over lending terms and representations is difficult to anticipate and the exposure could be significant.

Numerous exposures exist that many holding company organizations may not recognize. For example, the Federal Reserve System encourages evaluation of wire transfer exposure. This exposure is very large and theoretically a breakdown on the framework or compromise of internal systems could result in major failures. Exposure from foreign exchange contracts also can be large, and may not always be recognized. Fraud and exposure of management to kidnapping continue to increase in importance. And finally, some major holding company organizations have found that dependence on short-term market funds creates a risky exposure. When access to a funding market may be suddenly withdrawn, the exposure of the entire funding process is an issue.

The second step of the risk identification process is specification of the variables that could affect an exposure and determination of what the impact would be.

This process is difficult, since any number of variables may influence an exposure. Furthermore, as the environment changes new variables may appear relevant and the effects of variables may change. For example, the recent problems of public sector lending to foreign countries with loans denominated in dollars having floating interest rates during inflationary periods may not have been fully evaluated at the time of the lending process.

Determining influential variables is particularly difficult with new products. A historical examination cannot be made of these new products and questions may go unanswered regarding the stability of the new markets. For example, problems have occurred in hedging operations as underlying instruments did not move as expected, thus negating the hedging contract. Consequently, the hedge created an exposure rather than reducing an exposure.

The final step of the risk identification process is risk quantification.

Conceptually, this involves calculation of an expected loss of value related to variance of a particular environmental factor. This has two parts: (1) estimation of the probability that a given variance will occur; and (2) determination of the cost impact of each potential variance. Probabilities are often drawn up in general terms. In some cases historical records facilitate estimation of probabilities. Measurement of credit risk in an organization that specializes by industry or geography may be an example of this. In the most recent recession, however, many past records have proven not to be accurate predictors. In other situations, the holding company organization may evaluate the effect of a change but be unwilling to estimate probabilities of the change occurring. An example of this is managing asset and liability maturities. The effect of a change in interest rates on profits may be determined; but, in many cases, institutions will not derive probabilities on the direction and/or magnitude of interest rate movements.

The difficulty of quantifying costs and probabilities is exacerbated by emergence of new products and by environmental changes. With a new product, it is particularly difficult to determine the cost of a variance. For example, attention to interest rate risk has induced organizations to resort to hedging to reduce exposure. Innovative instruments are difficult to hedge, however, since the issuer may inaccurately gauge price movements. In this case, the exposure results not from price movements, but from inability to predict the relationship between market and price fluctuations. Furthermore, as the environment changes, the effect of a variable on an exposure changes as does the cost and probability of the occurrence. For example, in the 1970's the impact of inflation on the banking system would have been very different without the concurrent economic downturn and the technological advances.

2160.0.2 RISK CONTROL

After management has identified and evaluated risk, they may decide the risk or cost of an action is sufficiently low (and management is confident all possible variables have been identified) that the holding company can take on the risk as it is; if not there are a number of options that can be used to control the risk. Attempts to control risk can be accomplished through a combination of three general techniques: purchase of insurance, limitation of exposure size, and reduction of the expected cost associated with a variance. The use of insurance to decrease the effect of a loss on the corporation is common for exposure to fire, theft, kidnapping, and internal fraud. Various types of loans are underwritten by third parties. The innovative use of insurance may prove to have various applications to risk control in the banking industry. As with other contracts, the financial strength and reputation of the counterparty (the insurer) are important, and the organization's method of selecting and monitoring underwriters should be evaluated.

Management generally limits the level of exposure in relationship to the size of assets, capital or earnings. In most situations, relating the level of exposure to capital would appear appropriate. Reduction of exposure will automatically reduce risk, assuming other variables remain constant. Constraints should be determined by line management at a seniority level commensurate with the degree of perceived risk. Depending on the degree of risk, there may be a need for the board of directors to approve the constraints.

The third method of reducing the potential loss to the corporation involves decreasing the probability of a variance occurring or decreasing the probable effect when a variance occurs. This is exemplified by the exposure to fire. Installation of fire alarms and other precautions could reduce the expected loss substantially. Similarly, hedging with financial futures is a method used to reduce the effect of interest rate movement on the profits of the holding company organization when the maturities of assets and liabilities are not equal.

The final option management has, after risk has been evaluated, is simply not to participate in the activity if the risk is determined to be too high for the expected return.

The inspection procedures should include a broad-based evaluation of parent level risk management. Management's effectiveness in identifying risk, its willingness to accept risk, and its ability to control risk should be regularly evaluated. In an environment of rapid change and emerging financial instruments, there needs to be sufficient expertise to recognize the existence of ''new'' sources of risk concentration to evaluate the company's command of those sources.

2160.0.3 INSPECTION OBJECTIVES

1. To review the risk evaluation and control process.
2. To determine if management's system of identifying risks is effective, and if the parent company is adequately informed of risks throughout the organization.
3. To determine management's recognition of new risks that may arise from the changing environment.
4. To determine the reasonableness of the holding company's exposure-risk figures.
5. To assess the effect on the holding company's financial condition if the risk figures are realized.
6. To determine what actions are necessary to rebalance transactions of a holding company organization to a prudent level.

2160.0.4 INSPECTION PROCEDURES

1. Review the financial condition and the operations of the holding company organization to detect substantive exposure-risk situations.
2. Review management's policies, procedures, and practices in recognizing exposure-risk factors.
3. Determine awareness that all management levels need to be cognizant of exposures related to transactions of their respective operations.
4. Review the holding company's exposure-risk figures, or constraints placed on types of transactions.
5. Discuss with management the significance of exposure-risks facing the holding company and whether or not those risks are set at seemingly prudent levels.
6. Recommend that the organization address any areas where the holding company is perceived to have assumed an imprudent level of risk.

2170.0.1 INTRODUCTION

On April 10, 1985, the Board approved a supervisory policy, via the Federal Financial Institutions Examination Council, for supervising banking organizations that participate in the purchase and sale of loans guaranteed by the U.S. government. The policy reminds those organizations that premiums received in lieu of servicing fees, with respect to the selling and servicing entity, are to be amortized over the life of the loan; and that, with respect to the purchaser, the premiums paid over the face value of the note are not guaranteed and are not paid by the guaranteeing federal agency when the loans are prepaid or in default. The statement thus cautions against paying inappropriate or excessive premiums.

2170.0.2 RECOMMENDATIONS FOR ORIGINATING AND SELLING INSTITUTIONS

Examiners should review the extent and nature of activities in connection with the sale of government guaranteed loans. Lax or improper management of the selling institution's servicing responsibilities should be criticized. Out-of-trade area lending for the purpose of resale of any portion of U.S. government guaranteed loans should be carefully reviewed to ensure that the practice is conducted in a safe and sound manner.

All income, including servicing fees and premiums charged in lieu of servicing fees, associated with the sale of U.S. government guaranteed loans, should be recognized only as earned and amortized to appropriate income accounts over the life of the loan.

2170.0.3 RECOMMENDATIONS FOR PURCHASING INSTITUTIONS

Purchasers of U.S. government guaranteed loans should be aware that the purchase premiums are not guaranteed and are not paid by the guaranteeing Federal agency when the loans are prepaid. Because payment of premiums which do not reasonably relate to the yield on the loan can distort published financial reports by overstating the value of a banking organization's assets, it will generally be viewed as an unsafe and unsound practice to pay purchase premiums which result in a significant overstatement in the value of bank assets.

Many government guaranteed loans currently being originated and sold are variable rate. These variable rate loans normally should not trade at anything more than a modest premium or discount from par. Examiners will carefully review any loans being sold or purchased at significant premiums and will criticize any involvement with excessive premiums as an unsafe and unsound business practice. Excessive purchase premiums will be classified loss. The loans will be required to be revalued to the market value at the time of the acquisition and the excessive premiums will be charged against current earnings.

In addition, any unamortized loan premium on a government guaranteed loan must be immediately charged against income if the loan is prepaid, regardless of whether payment is received from the borrower or the guaranteeing agency.

2175.0.1 INTRODUCTION

Banking organizations have become increasingly involved in marketing third-party uninsured annuities to their retail customers either directly or through third-party companies. As annuity sales have grown, so have concerns that some methods used to sell these instruments could give purchasers the impression that the annuities are federally insured deposits or that they are obligations of a bank. In the event of default by an annuities underwriter, this impression could cause a loss of public confidence in a depository institution, leading to unexpected withdrawals and liquidity pressures. Moreover, a bank or bank holding company that advertises or markets annuities in a way viewed as misleading could potentially be held liable for losses sustained by annuity holders.

This manual section provides guidelines to examiners for reviewing the sale of uninsured annuities by bank holding companies and banks that have legal authority to act as agent in the sale of annuities. State member banks and bank holding companies should not market, sell, or issue uninsured annuities or allow third parties to market, sell, or issue uninsured annuities on depository-institution premises in a manner that conveys the impression or suggestion that such instruments are either (1) federally insured deposits or (2) obligations of or guaranteed by an insured depository institution. Consequently, state member banks should not sell these instruments at teller windows or other areas where retail deposits are routinely accepted.

2175.0.2 PERMISSIBILITY OF UNINSURED ANNUITY SALES

The legal status of annuities under the Bank Holding Company Act is somewhat uncertain at the present time. The Office of the Comptroller of the Currency has authorized national banks to act as agent in the sale of annuities on the basis that variable-rate annuities are securities and fixed-rate annuities are financial investment instruments.[1] These determinations, however, have been challenged by insurance associations on the basis that annuities are insurance products and, therefore, may be sold by national banks only in a town of less than 5,000.[2]

State member banks generally have been permitted to engage in the brokerage of both variable- and fixed-rate annuities consistent with their general corporate powers. In order to engage in this activity without filing a formal application, staff has advised interested banks that the brokerage of annuities must be expressly authorized under state law (or by the state banking regulatory agency on a case-by-case basis) and constitute an activity incidental to the bank's banking activities.

The authority of state member banks to continue to engage in this activity, in the same manner and subject to the conditions discussed above, does not appear to depend on a resolution of the issues.[3] State member banks have been permitted to engage in general insurance agency activities since 1937,[4] and to engage in brokerage activities under the same limitations applicable to bank holding companies. In addition, the Board has determined that the nonbanking restrictions in the Bank Holding Company Act do not apply to the direct activities of banks owned by a bank holding company.[5]

The authority of bank holding companies to engage directly or through a nonbanking subsidiary in the sale of annuities has not yet been determined. In *Norwest Corporation*,[6] the Board considered a proposal by a nonbanking affiliate to engage in the sale of variable- and fixed-rate annuities. The Board concluded that, under the specific facts of that case, it was unnecessary to reach the question of whether the sale of annuities is an insurance agency activity because Norwest is one of a small number of bank holding companies entitled to act as agent in the

sale of any type of insurance pursuant to Exemption G of the Garn Act.[7]

2175.0.3 CHARACTERISTICS OF ANNUITY INSTRUMENTS

An annuity is an investment from which a person receives periodic payments based on earlier payments made to the obligor. Annuities are commonly underwritten by insurance companies, then marketed and sold either directly or through third parties, such as banks. Insurance companies retain the actuarial and underwriting risks on these annuities.

Annuities may be either variable or fixed-rate. An investor in a variable annuity contract purchases a share in an investment portfolio and then receives payments that vary according to the performance of the portfolio. A purchaser of a fixed-rate annuity contract, in contrast, receives a fixed-rate payment or minimum level of payments. Annuity payments can usually be received monthly, quarterly, semi-annually, or annually.

Variable- and fixed-rate annuities may be purchased in a single lump sum (‘‘single premium’’) or in periodic contributions (‘‘flexible premium’’). Minimum and maximum contributions to annuities vary among vendors. Some single-premium annuities have ‘‘bail-out’’ features which allow holders to withdraw all funds if the rate of return on the annuity contract falls below a specified rate.

The ability to take money out of an annuity prior to maturity varies by product, as does the imposition of a surrender penalty by the insurer when withdrawal occurs prior to maturity. When a penalty is imposed, the insurer generally calculates the penalty as a percentage of the annuity product's accumulated value. The penalty for withdrawal generally declines with the annuity's age. Normally, funds may not be withdrawn prior to the first anniversary date of the annuity.[8]

Annuities sold at depository institutions often include rate guarantees over the life of the instrument. They also frequently mature in one, three, or five years, similar to maturity ranges on certificates of deposit.

Insurance companies arrange for the sale of annuities on the premises of depository institutions in different ways. Some insurance companies approach banks directly. At other times, wholesalers (who market the products of a number of different insurance companies) may approach a bank. Depending on state restrictions on insurance activities, sales might be conducted by bank employees, employees of bank subsidiary insurance agencies, or by third-party insurance agents leasing space on the bank's premises.

Sales commissions on annuities vary by the type of annuity. Commissions earned on single-premium products generally vary from 4 percent to 6 percent, but they decline sharply when the product sold includes a ‘‘bail-out’’ provision. Wholesalers may also give retailers a commission when the annuity is renewed, based on the accumulated value of the annuity. Commissions in some instances are paid on a variable basis, rising as the volume of sales increases.

2175.0.4 IMPROPER MARKETING PRACTICES

Banks have become involved in the sale of uninsured annuities through marketing programs designed to appeal specifically to their retail customers. It is important that these programs not employ marketing practices that could mislead the bank's customers. For example, the use in annuities advertisements of terms such as ‘‘CD,’’ ‘‘deposit,’’ and ‘‘interest plan’’ to imply that the instruments are insured deposits would be inappropriate. Also, advertisements that prominently display the bank's name and logo in a way that suggests the product is an obligation of the bank are similarly inappropriate. Disclosure that the annuities are not federally insured and are not obligations of the bank should be displayed prominently in annuity contracts and related documentation, on printed

7. The Garn Act amended section 4(c)(8) of the Bank Holding Company Act to prohibit generally bank holding companies from engaging in insurance activities as a principal, agent, or broker with certain exceptions. Under the express language of the Garn Act, the sale of insurance is not ‘‘closely related to banking’’ and is not permissible for a bank holding company unless it qualifies under one of the seven specified exceptions (Exemptions A–G) in the Garn Act. Exemption G applies to a limited number of bank holding companies that received approval from the Board prior to January 1, 1971, to conduct insurance agency activities. In order to utilize Exemption G or any other Garn Act exemptions that may be applicable, the bank holding company must file an application and would be subject to the proposed restrictions through the application process.

8. If an investor withdraws tax-deferred income from an annuity before the investor is 59½ years old, the IRS levies a tax penalty on the person equal to 10 percent of the amount of tax-deferred income withdrawn. This penalty may be avoided only if the person reinvests annuity proceeds in another tax-deferred investment within 60 days of the withdrawal.

advices, and verbally emphasized in telemarketing contacts. Finally, personnel selling uninsured annuities should be distinguishable from bank employees conducting normal retail deposit-taking operations.

2175.0.5 INSPECTION OBJECTIVES

1. To review the marketing and sale of uninsured annuities sold by the bank holding company and its member banks, or those sold through a third party.
2. To determine whether the bank holding company and its banks have adequate policies and procedures in place and if they are monitored by the parent company.
3. To determine if, prior to agreeing to sell annuities, a comprehensive financial analysis is made of the financial condition of the annuities underwriter and whether products of only financially secure underwriters are sold.
4. To determine whether the contract and advertising and related documents disclose prominently that the annuities do not represent deposits or obligations of an insured depository institution and that they are not insured by the Federal Deposit Insurance Corporation.
5. To ascertain that annuities are not sold at teller windows or other areas where deposits are routinely accepted.

2175.0.6 INSPECTION PROCEDURES

1. Determine whether the bank holding company and its banks have adequate policies and procedures in place:

a. to assess the financial condition of the annuities underwriter;

Banking organizations engaged in the sale of annuities are expected to sell only products of financially secure underwriters. Prior to agreeing to sell annuities, a comprehensive financial analysis of the obligor should be performed and reviewed with the banking organization's directors. The policies should also include a program to evaluate the underwriter's financial condition at least annually and to review the credit ratings assigned to the underwriter by the independent agencies evaluating annuity underwriters.

b. to ensure that the marketing and sale of uninsured annuities is not misleading and is separated and distinguished from routine retail deposit-taking activities.

(1) With regard to the sale of annuities, determine whether the contract, advertising, and all related documents disclose prominently in bold print that the annuities:

(a) are not deposits or obligations of an insured depository institution; and

(b) are not insured by the Federal Deposit Insurance Corporation.

(2) State member banks should not sell annuity instruments at teller windows or other areas where retail deposits are routinely accepted. In assessing the adequacy of disclosures and the separation of the marketing and sale of uninsured annuities from the retail deposit-taking function, examiners should take into account whether:

(a) advertisements *do not* contain words, such as ‘‘deposit’’, ‘‘CD’’, etc., or a logo that could lead an investor to believe an annuity is an insured deposit instrument;

(b) the obligor of the annuity contract is prominently disclosed, and names or logos of the insured depository institution are not used in a way that might suggest the insured depository institution is the obligor;

(c) adequate verbal disclosures are made during telemarketing contacts and at the time of sale;

(d) retail deposit-taking employees of the insured depository institution *are not engaged* in the promotion or sale of uninsured annuities;

(e) information on uninsured annuities *is not* contained in retail deposit statements of customers or in the immediate retail deposit-taking area;

(f) account information on annuities owned by customers *is not* included on insured deposit statements; and

(g) officer or employee remuneration associated with selling annuities is limited to reasonable levels in relation to the individual's salary.

(3) If a bank allows a third-party entity to market annuities on depository institution premises, examiners should take into account whether:

(a) the depository institution has assured itself that the third-party company is properly registered or licensed to conduct this activity;

(b) depository institution personnel *are not* involved in sales activities conducted by the third party;

(c) desks or offices *are not* used to market or sell annuities, are separate and distinctly identified as being used by an outside party; and

(d) depository institution personnel *do not* normally use desks or offices used by a third party for annuities sales.

2. Determine that advertisements do not prominently display the bank's name and logo that suggests the product is an obligation of a BHC bank.

3. Determine whether the banks obtain a signed statement from the customer indicating that the customer understands that the annuity is not a deposit or any other obligation of the depository institution, that the depository institution is only acting as an agent for the insurance company (underwriter), and that the annuity is not FDIC insured.

Existing regulations permit banks and bank holding companies to engage in a wide range of securities activities in overseas markets. For a number of years these activities were not considered to be significant in the context of total bank and bank holding company assets. Indigenous rules and market practice served to constrain to a degree securities activities of U.S. banking organizations overseas.

Changes in local rules now make it possible for members of the London stock exchange to be wholly-owned by non-member companies and by year-end 1986 will allow stockbrokers to act as principals or market makers in securities. These new rules are expected to change significantly the complexion of the London securities market. In this context, U.S. banking organizations are making substantial investments in U.K. securities firms, and are also significantly expanding their securities business in other foreign and international markets.

The Board has expressed its concerns, in connection with an application by a banking organization to expand its securities activities overseas, that proper safeguards, limits, and controls will be exercised to protect the organization from undue risk. Applications generally state the methods through which the banking organization plans to control risk and establish oversight over securities operations. While these safeguards are initially evaluated at the time the application is made, nevertheless, examinations of bank holding companies and Edge corporations should incorporate an assessment of all overseas securities activities in order to determine the degree to which these activities conform to high standards of banking and financial prudence. The affiliation of a securities company, especially one engaged in corporate debt and equities transactions, with a banking organization raises a potential for conflict of interest and in some cases could pose substantial additional risk to the institution.

In those U.S. banking organizations where overseas securities trading and brokering are significant in scope or are prominent in the scale of the local market, examination procedures must incorporate an assessment of the controls, limits, and safeguards implemented by the organization to monitor and contain risk. Securities activities should be subject to the same degree of scrutiny and rigorous assessment of risk as bank lending activities. In addition, examiners should monitor the substance and nature of all transactions.

In particular, the following kinds of activities should be reviewed to determine whether they raise considerations of safety and soundness or otherwise do not conform to standards of prudence required of U.S. banking organizations:

- The degree of lending by a bank holding company to its securities affiliate, especially when loans are extended to support or enhance the obligations underwritten by the securities affiliate;
- The extent to which securities underwritten by an affiliate are purchased by the bank holding company as principal or trustee; and,
- The extent to which the parent is liable to an exchange for any losses incurred by the affiliate due to failure to deliver securities or settle contracts.

Targeted examinations and investigations by the Federal Reserve and the Enforcement Division of the Securities Exchange Commission (SEC), as well as court actions, have found banks in violation of Regulation U, Credit by Banks for the Purpose of Purchasing or Carrying Margin Stock, (12 C.F.R. 221) when their trust departments, using bank or other fiduciary funds, have extended credit to individuals involved in illegal day trading or free-riding schemes. These activities also involved the aiding and abetting of violations of two other securities credit regulations: Regulation T, Credit by Brokers and Dealers (12 C.F.R. 220), and Regulation X, Borrowers of Securities Credit, (12 C.F.R. 224).

Day trading and free-riding schemes involve the purchase and sale of stock on the same day (or within a very short period of time) and the funding of the purchases with the proceeds of the sale. Banking organizations[1] engaging in such illegal activities may subject themselves to disciplinary proceedings, as well as to substantial credit risk.

Federal Reserve examiners should ensure that banks and bank holding companies (including the broker-dealer and trust activities of banking and nonbanking subsidiaries of state member banks and bank holding companies) are not engaged in such illegal activities. Examiners must make certain that these entities have taken all steps necessary to prevent their customers from involving them in free-riding. Prompt enforcement action may be needed to eliminate free-riding activities. (See SR-93-13.)

2187.0.1 TYPICAL DAY TRADING OR FREE-RIDING ACTIVITIES

The free-riding conduct in question typically involves trading large amounts of securities without depositing the necessary money or appropriate collateral in their customer accounts. The customer seeks to free-ride, that is, purchase and sell the same securities and pay for the purchase with the proceeds of the sale. Often, free-riding schemes involve initial public offerings because broker-dealers are prohibited from financing these new issues. If the money to pay for the securities is not in the account when the securities are delivered in a delivery-versus-payment (DVP) transaction, a bank that permits completion of the transaction creates a temporary overdraft in the customer's account. This overdraft is an extension of credit that subjects the banks to Regulation U.

The typical free-riding scheme involves a new customer's opening a custodial agency account into which a number of broker-dealers will deliver securities or funds in DVP transactions. Although a deposit may be made into the custodial agency account, the amount of trading is greatly in excess of the original deposit, causing the financial institution to extend its own credit to meet the payment and delivery obligations of the account. Therefore, although the financial institution may be earning fees as a result of the activity in these accounts, it is subjecting itself to substantial losses if the market prices for the purchased securities fall or the transactions otherwise fail. In addition, other liabilities under federal banking and securities laws may be involved.

2187.0.2 SECURITIES CREDIT REGULATIONS

2187.0.2.1 Regulation U, Credit by Banks or Persons Other Than Brokers or Dealers for the Purpose of Purchasing or Carrying Margin Stocks

Any extension of credit in the course of settling customer securities transactions, including those occuring in a trust department or trust subsidiary of a bank holding company, must comply with all of the provisions of Regulation U.[2] Regulation U requires all extensions of credit for the purpose of buying or carrying margin

1. The use of the term ''banking organization'' in this section, with regard to Regulation U, means a bank, trust department of a bank, or trust company of a bank holding company that is subject to Regulation U. Regulation U includes any nondealer nonbank subsidiary of a bank holding company that extends purpose credit by margin stock. With regard to Regulation T, it refers to any nonbank company that conducts broker-dealer activities.

2. For purposes of the regulation, the definition of ''bank'' specifically includes institutions ''exercising fiduciary powers.'' (See 12 C.F.R. 221.2, 15 U.S.C. 78(c)(a)(6), and *Federal Reserve Regulatory Service* at 5–795 (1946).) When used in discussing a bank's trust department or any other type of financial institution exercising fiduciary powers, the term ''extension of credit'' includes overdrafts in settling customer's accounts that may be covered by advances from the banking organization, from other fiduciary customers, or from a combination of both.

stock that are secured by margin stock to be within the 50 percent limit. To avoid violations of the Board's securities credit regulations, on settlement date, the customer's account must hold sufficient funds, excluding the proceeds of the sale of the security, to pay for each security purchased. Although Regulation U applies only to transactions in margin stock, free-riding in nonmargin stocks in custodial agency accounts could result in a banking organization's aiding and abetting violations of Regulations T and X and other securities laws, and could raise financial safety-and-soundness issues.

2187.0.2.2 Regulation T, Credit by Brokers and Dealers, and Regulation X, Borrowers of Securities Credit

Because the custodial agency accounts are used to settle transactions effected by the customer at broker-dealers, a banking organization that opens this type of account should have some general understanding of how Regulation T restricts the customer's use of the account at the institution. Regulation T requires the use of a cash account for customer purchases or sales on a DVP basis. Section 220.8(a) of Regulation T specifies that cash-account transactions are predicated on the customer's agreement that the customer will make full cash payment for securities before selling them and does not intend to sell them before making such payment. Therefore, free-riding is prohibited in a cash account. A customer who instructs his or her agent financial institution to pay for a security by relying on the proceeds of the sale of that security in a DVP transaction is causing, or aiding or abetting, the broker-dealer to violate the credit restrictions of Regulation T. Regulation X, which generally prohibits borrowers from willfully causing credit to be extended in violation of Regulations T or U, also applies to the customer in such cases.

As described above, banking organizations[3] involved in customer free-riding schemes may be aiding and abetting violations of Regulation T by the broker-dealers who deliver securities or funds to the banking organization's customers' accounts. As long as a financial institution uses its funds to complete a customer's transactions, broker-dealers may not discover that they are selling securities to the customer in violation of Regulation T. A similar aiding and abetting violation of Regulation X could occur if a customer used the financial institution to induce a broker-dealer to violate Regulation T.

3. For a discussion of Regulation T as it applies to a bank holding company's broker-dealer nonbank subsidiary, see section 3230.0.

2187.0.3 NEW-CUSTOMER INQUIRIES AND WARNING SIGNALS

Examiners should make certain that all banks and other financial-institution subsidiaries of a bank holding company are administering and following appropriate written policies and procedures concerning the establishment of custodial agency accounts or any new account involving customer securities transactions. Such policies and procedures should address, among other things, ways an institution can protect itself against free-riding schemes. One way is to obtain adequate background and credit information from new clients, including whether the customer intends to obtain credit to use with the account. This type of activity requires more extensive monitoring than the typical DVP account in which no credit is extended. It would be prudent to inquire why a new customer is not using the margin-account services of its broker-dealers. If the account is to be used as a margin account, a financial institution must obtain Form FR U-1 from the customer and must sign and constantly update the form.

The financial institution should obtain from the customer a list of broker-dealers that will be sending securities to or receiving funds from the account in DVP transactions. If a number of broker-dealers may be used, the institution should obtain from the customer a written statement that all transactions with the broker-dealer will conform with Regulations T and X and that the customer is aware that a security purchased in a cash account is not to be sold until it is paid for. Similarly, when obtaining instructions for settling DVP transactions for a customer, the financial institution should clarify that it will not rely upon the proceeds from the sale of those securities to pay for the purchase of the same securities.

2187.0.4 SCOPE OF THE INSPECTION FOR FREE-RIDING ACTIVITIES

Examiners, bank holding companies, state member banks, and financial-institution and trust subsidiaries owned by bank holding companies (also U.S. branches and agencies of foreign banks exercising trust powers) should ensure that their banking organizations monitor accounts closely for an initial period to detect patterns typical of free-riding, including intraday overdrafts, and to ensure that sufficient funds or margin collateral are on deposit at all times. Frequent transactions in securities being offered in an initial public offering may suggest an avoidance of Regulations T and X. If it appears that a customer is attempting to free-ride, the financial institution should immediately alert the broker-dealers involved in transferring securities and take steps to minimize its own credit risk and legal liability.

At a minimum, examiners should also evaluate a trust institution’s ability to ensure that it does not extend to a customer more credit on behalf of a bank or other financial institution than is permitted under Regulation U. If there are any questions in this regard, examiners should consult with their Reserve Bank’s trust examiners. Any overdraft that is related to a purchase or sale of margin stock, and that is secured by margin stock, is an extension of credit subject to the regulation, including overdrafts that are outstanding for less than a day. Board staff have published a number of opinions discussing the application of Regulation U to various transactions relating to free-riding.

Free-riding violations that could endanger the banking organization (for example, fraudulent activities that could subject the organization to losses or lawsuits), as well as significant violations that were previously noted but have not yet been corrected, should be noted in the inspection report. Violations of the Board’s Regulation T, U, or X, as applicable to the inspection, should be reported on the Examiner’s Comments and Violations report pages. The report should discuss what action has or will be taken to correct those violations.

2187.0.5 SEC AND FEDERAL RESERVE SANCTIONS AND ENFORCEMENT ACTIONS

The SEC, in exercising its broad authority to enforce the Board’s securities credit regulations, requires banks to (1) establish credit compliance committees to formulate written policies and procedures concerning the extension of purpose credit in their securities-clearance business, (2) establish training programs for bank personnel responsible for the conduct of their securities-clearance business, and (3) submit to outside audits to verify their compliance with the conditions of injunctions. The Board may also institute enforcement proceedings against the banking organizations it supervises and against any institution-affiliated parties involved in these activities, including cease-and-desist orders, civil money penalty assessments, and removal and permanent-prohibition actions.

2187.0.6 INSPECTION OBJECTIVES

1. To make certain that policies of the bank holding company’s board, and the supervisory operating procedures, internal controls, and audit procedures will ensure, in the course of settling customers’ securities transactions—
   a. that bank extensions of credit within the holding company comply with the provisions of Regulation U (including the requirement that initial extensions of credit that are secured by margin stock are within the initial 50 percent margin limit) and
   b. that customer accounts hold sufficient funds on the settlement date for each security purchased.
2. To determine—
   a. whether the banking organizations of the bank holding company can adequately monitor compliance with Regulation U through systems of internal controls, training, and compliance procedures (i.e., use of credit compliance committees) that address free-riding activities within the ‘‘back-office function’’ [4] and
   b. whether noncompliance is properly reported.
3. To initiate corrective action when policies, practices, procedures, or internal controls are not sufficient to prevent free-riding schemes, and when violations of the Board’s regulations have been noted by bank examiners or self-regulatory organizations.

2187.0.7 INSPECTION PROCEDURES

1. Review the bank holding company’s board of directors’ policies for its banking institution subsidiaries regarding supervisory operational policies, procedures, and internal controls for loans extended for the purpose

4. Refers to the movement of cash and securities relating to trades and to the processing and recording of trades. This process is also called the ‘‘securities-clearance cycle.’’

of buying or carrying margin stock and secured directly or indirectly by margin stock.

a. Determine whether the policies require, for *each* extension of credit not specifically exempted under Regulation U, that a Form FR U-1 be executed and signed by the customer and accepted and signed by a duly authorized officer of the banking organization acting in good faith.

b. Determine whether the policies limit extensions of credit to no more than the maximum allowed loan value of the collateral, as set by section 221.7 of Regulation U, and whether those policies require adherence to margin requirements.

2. Review the bank holding company's board of directors' credit policies and operating policies, internal controls, and internal audit procedures to determine if they provide adequate safeguards against customers' free-riding practices. In so doing—

a. determine if new-customer accounts are required to be approved by appropriate personnel; and

b. establish whether the bank holding company's credit-system policies require—

- controlling securities positions and financial-instrument contracts that serve as collateral for loans;
- monitoring established restrictions and limits placed on the amounts and types of transactions to be executed with each customer and the dollar amounts placed on unsettled trades;
- obtaining appropriate documentation consisting of essential facts pertaining to each customer, and in particular, financial information evidencing the customer's ability to pay for ordered securities, repay extensions of credit, and meet other financial commitments;
- monitoring the location of all collateral;
- ensuring that there are no overdrawn margin accounts; and
- monitoring the status of failed transactions for the purpose of detecting free-riding schemes.

3. Determine if the bank holding company's audit committee or its internal or external auditors are required to review a selected random sample of individual or custodial agency accounts for customer free-riding activities.

2187.0.8 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*

2220.3.1 NOTE ISSUANCE FACILITY (NIF)

One type of off-balance-sheet activity is the note issuance facility (NIF). The first public facility was arranged in 1981. A NIF is a medium-term arrangement under which a borrower can issue short-term paper. The paper is issued on a revolving basis, with maturities ranging from as low as 7 days to up to one year. Underwriters are committed either to purchasing any unsold notes or to providing standby credit. Bank borrowing usually involves commercial paper consisting of short-term certificates of deposit and for nonbank borrowers it would generally be promissory notes (Euronotes). NIF is the most common term used for this type of arrangement. Other terms include the revolving underwriting facility (RUF), and the standby note issuance facility (SNIF). NIFs, RUFs, and SNIFs are essentially the same credit product. The NIF is usually structured for 5 to 7 years.

Euronotes are denominated in US dollars and are issued with high face values (often $500,000 or more), being intended for the more sophisticated investor (professional or institutional investors). Holders of the notes show them as an asset on their balance sheets. The underwriting commitment represents an off-balance sheet item. The NIF allows the various functions performed by a single institution in a syndicated credit to be separated and performed by different institutions.

Instead of lending money, as in a syndicated credit, the NIF arranger provides a mechanism for placing notes with other investors when funds are needed. The underwriting commitment transforms the maturity, assuring the borrower access to short-term funds over the medium term, which remains off-balance sheet, unless drawn upon. The underwriters take the short-term credit risk since they face the risk of lending to a borrower that has difficulty in obtaining full confidence from investors.

NIFs can be arranged with an issuer-set margin whereby the issuer determines the margin over LIBOR (the London Interbank Offered Rate), or some other index at which notes will be offered. The issuer thus benefits from any improvement in market conditions. The notes are placed by the placing agent, but senior underwriters have the option of purchasing a prearranged share of any notes issued. Any notes not taken up at the issuer-set margin are distributed to underwriters at the pre- established maximum (cap) rate.

2220.3.2 REVOLVING UNDERWRITING FACILITY (RUF)

Another type of facility, a revolving underwriting facility (RUF), was introduced in 1982. A revolving underwriting facility is a medium-term revolving commitment to guarantee the overseas sale of short-term negotiable promissory notes (usually a fixed-spread over LIBOR) issued by the borrower at or below a predetermined interest rate. RUFs separate the roles of the medium-term risk-taker and the providers of the funding (the short-term investors). RUFs and NIFs allow access to capital sources at interest rates considerably below conventional financing rates. The savings in interest cost are derived because the borrower obtains the lower interest costs prevailing in the short-term markets, while still retaining the security of longer term financing commitments. The notes issued under RUFs are attractive for institutional investors since they permit greater diversification of risk than the certificates of deposit of only one bank. Underwriters favor them because their commitments do not appear on the statement of financial condition. RUFs are usually structured for periods of four to seven years.

A revolving underwriting facility (RUF) differs from a (NIF) in that it separates the functions of underwriting and distribution. With a RUF, the lead bank (manager or arranger) acts as the only placing agent. The arranger retains total control over the placing of the notes. The lead bank provides assistance to a borrower who forms a lending group of banks. The borrower, assisted by a lead bank (arranger), obtains a medium term revolving commitment that guarantees the sale of short-term negotiable promissory notes at or below a pre-determined interest rate. The participating group of banks arrange the funding, subject to certain lending conditions and rates, for the duration of the facility. In return, the borrower pays a facility fee to the revolving credit banks.

When the borrower desires funds, a placement agent or tender panel[1] places short-term notes with other banks and institutional investors (usually having maturities of 90 days, 180 days or 12 months). The short term notes can be issued to these investors at significantly lower interest rates than would be available from a revolving credit facility that the same banks would have been willing to provide. The note purchasers generally have a rollover option at maturity and new note purchasers are added as needed. The note purchasers bear the risk of loss in the event of default by the borrower. New note purchasers are added as needed. In the event the full line of credit is not placed with the note purchasers on any rollover date, the revolving credit banks must make funding available for the difference at the previously committed revolving credit interest rates, subject to the terms and conditions within the agreement.

With the RUF, and the use of a sole placing agent, the underwriters are not assured of securing any notes that they could place themselves nor can they benefit from any improvement in terms available in the market. The hindrance is removed by the use of NIFs with an issuer-set margin whereby the issuer determines the margin over an index at which notes will be offered.

Another form of a RUF is a transferable revolving underwriting facility (TRUF). With this arrangement the underwriter is able, with the borrower's approval, to transfer all rights and obligations under the underwriting commitment to another institution at any time during the life of the facility.

2220.3.3 RISK

The loan commitments involved in NIF and RUF transactions contain substantially the same terms as other loan commitments extended to similar borrowers. The failure of the borrower to satisfy the revolving standby agreement relieves the banks of any obligation to fund the transaction. The major source of risk is thus the liquidity risk that is derived from the uncertainty of the timing or amount of required funding. If the underlying notes cannot be marketed at or below the interest rate specified in the agreement, the bank would need to discount the notes to whatever rate would be necessary to make the notes attractive to investors, perhaps taking an up-front loss to avoid funding a low margin loan.

NIFs and RUFs involve less credit risk than extensions of credit because of the additional step that is required before funding takes place, a step that is not present with a revolving credit agreement. In other words, no funding is required until: (1) a decision is made by the borrower to issue notes; and (2) the placing agent becomes unable to place the short-term notes with short-term investors. Further, the risk of loss rests with the note investors. The underwriter's risk of nonpayment is not present until the rollover date. If there has been a significant deterioration in the issuer/borrower's financial condition on that date, the issuer/borrower may be prevented from drawing under the facility. This would be dependent on the funding conditions or the cancellation provisions stipulated in the agreement.

2220.3.4 PRICING AND FEES

The forms of compensation involving a NIF and RUF are: the underwriting and commitment fee; the one-time arrangement fee, and the periodic placement fees. An annual fixed underwriting fee is paid by the borrower on the amount of underlying commitment. This fee must be paid regardless of the frequency of usage of the facility or whether or not the underwriters are required to make any purchases of the short-term paper. This compensation is for the commitment to underwrite the issuance of the notes. The arranger receives a one-time arrangement fee based on a percentage of the amount of the facility. The issuer pays the borrowing costs on the notes issued, usually at a spread above or below an index. A portion of this borrowing fee is retained by the placement agent or the tender panel members as compensation for placing the paper.

Competitive pricing on NIFs and RUFS causes them to be very thinly margined. Commitment fees may be as low as 5 basis points for blue chip customers, while ''BBB'' credit-rated or equivalent borrowers might be charged as much as 20 basis points. Because of the thin spread some banks may only be serving as an

1. The tender panel was introduced in 1983. It is usually made up of several commercial investment banks and other institutional investors. The panel members bid for any notes issued, up to a predetermined maximum spread. The revolving credit banks can bid as part of the tender panel, but they are not required to do so. Any notes not bid for are purchased by the revolving credit banks or they extend credit of an equal amount. The tender panel may be a continuous tender panel whereby the underwriters are entitled to purchase notes from the lead manager up to their pro rata share at any time during the offer period, if available, at the market price.

arranger, preferring to not participate in the market. Typical fees for this service may consist of: an up-front arrangement fee of 20 basis points on the total principal amount of the facility, and an annual placement fee such as 12.5 basis points on the short-term notes sold. Revolving credit banks usually receive facility fees and annual maintenance fees.

If the underwriters have to purchase the notes, the backup rate of interest may be the index plus 10 to 15 basis points for blue chip companies to plus 37.5 basis points over the index for ''BBB'' rated borrowers. The interest rates charged (if funded) are usually lower because of market-pricing conventions (lower spreads) and the intense competition within the market.

2220.3.5 STANDBY RUFS

Some RUFS may provide for a utilization fee or may provide for a higher yield on the notes in the event that more than a nominal amount of paper is allocated to the underwriters. Such a provision would more likely be found in a standby facility. Standby facilities are backup commitments under which notes are not expected to be issued. This provision essentially protects the underwriter from having to book loans that are earning an insufficient yield. The structure of the facility generally determines its pricing depending upon the requirements of the issuer/borrower.

Standby RUFs substitute for committed bank lines which may be used, for example, as backup commitments for issuance of U.S. commercial paper. Commitment fees will be low because of the low probability that funds will need to be advanced. A standby facility will make borrowing from the underwriter very expensive in relation to what the issuer might have to pay. Otherwise, the underlying notes are issued on a regular basis, the maximum yield on the notes is set to approximate the normal market level for the issuer's short term borrowings.This facility would have a higher underwriting fee than a standby facility, because the regular issuances of notes increase the likelihood that the underwriting bank will have to purchase notes that cannot be placed.

2220.3.6 RUF DOCUMENTS

The *revolving credit agreement* is the primary document in a RUF. It includes the principal agreement of the transaction, executed by the revolving credit banks and the borrower. It contains the terms and conditions under which the borrower can draw on the facility. The document includes the financial covenants and events of default.

An *agency agreement* between the borrower and the placement agent designates the placement agent for the notes and sets forth the conditions of the agent's obligations for arranging the sale of the notes. Included are representations and warranties of the borrower regarding the authority to enter into the agreement and to issue the notes.

A description of the terms and conditions of the facility is contained within an *information memorandum*. Detail is provided with regard to the use of the proceeds, current and historical financial information, a description of the company, its finances and operations. It is distributed to prospective credit banks and note purchasers.

The *note* is the last document involving a RUF. Usually the notes will be unsecured obligations of the borrower and will include representations and warranties of the company regarding authorization and the absence of material litigation and bankruptcy proceedings. It will also contain a statement that a revolving credit facility is available to the borrower.

The Board has a long-standing policy on real estate appraisals, which emphasizes the importance of sound appraisal policies and procedures in a banking organization's real estate lending activity. In December 1987, the Board and the other bank regulatory agencies jointly adopted guidelines for real estate appraisal policies and review procedures. With the passage of the Federal Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (FIRREA), the Board, in August 1990, as well as the other federal financial institutions regulatory agencies, adopted regulations to implement the statute's title XI provisions (12 U.S.C. 3310, 3331–3351, and 1844(b)) relating to the performance and use of appraisals by federally regulated financial institutions. On June 7, 1994, the Board and the federal financial institutions regulatory agencies adopted several amendments to their appraisal regulations to clarify the agencies' appraisal requirements.[1] Additionally, the Board revised its guidelines for real estate appraisal and evaluation programs in September 1992 and October 1994. (See SR-94-50, SR-94-55, SR-95-16, SR-95-27, and SR-95-31 (SUP).)

The intent of title XI of FIRREA and subpart G of the Board's Regulation Y (12 CFR 225) is to protect federal financial and public policy interests in real estate–related financial transactions requiring the services of an appraiser. The statute requires that real estate appraisals be prepared in writing, in accordance with uniform standards, and by individuals with demonstrated competency and whose professional conduct is subject to effective supervision.

Title XI permitted each state to establish a program for certifying and licensing real estate appraisers who are qualified to perform appraisals in connection with *federally related transactions*.[2] Additionally, title XI designated the Appraisal Foundation, a nonprofit appraisal industry group, as the authority for establishing qualifications criteria for appraiser certification and standards for the performance of an appraisal. The states were authorized by title XI to establish qualification standards for licensing. It established the Appraisal Subcommittee of the Federal Financial Institutions Examination Council to monitor the requirements established to meet the intent of title XI.

The Board's appraisal regulation requires appraisals performed in connection with federally related transactions entered into after August 9, 1990, to comply with the regulation. Real estate–related financial transactions entered into before August 9, 1990, would have had to comply with the Board's supervisory guidelines, issued in 1987, as well as with safe and sound banking practices. Transactions are deemed to have been entered into and a loan is deemed to have been originated if there was a binding commitment to perform before the effective date. The requirement to use a state-certified or -licensed appraiser has a separate effective date, December 31, 1992.[3]

2231.0.1 APPRAISAL AND EVALUATION POLICY

A banking organization's board of directors is responsible for adopting policies and procedures that establish effective real estate appraisal and evaluation programs. Analyzing real estate collateral at a loan's inception and over its life requires a sufficient understanding of appraisals and evaluations to fully assess credit risk. While the appraisal plays an important role in the loan-approval process, undue reliance should not be placed on the collateral value in lieu of an

1. The appraisal standards for federally related transactions are found in sections 225.61 to 225.67 of subpart G of Regulation Y. Section 225.63 was amended, effective December 28, 1998, to exclude from the Board's appraisal requirements transactions that involve underwriting or dealing in mortgage-backed securities. The amendment permits bank holding company subsidiaries engaged in underwriting and dealing in securities to underwrite and deal in mortgage-backed securities without demonstrating that the loans underlying the securities are supported by appraisals that meet the Board's appraisal requirements. See 1999 FRB 50.

2. *Federally related transaction* refers to any real estate–related financial transaction entered into on or after August 9, 1990, that (1) the Board or any regulated institution engages in or contracts for and (2) requires the services of an appraiser. A *real estate–related financial transaction* is any transaction involving (1) the sale, lease, purchase, investment in, or exchange of real property, including interests in property, or the financing thereof; (2) the refinancing of real property or interests in real property; or (3) the use of real property or interests in property as security for a loan or investment, including mortgage-backed securities.

3. States have the flexibility to adopt an earlier implementation date regarding state requirements that an appraiser be certified or licensed to perform an appraisal within his or her state. Financial institutions doing business in a state that has an earlier effective date for mandatory use of a certified or licensed appraiser than the federally mandated effective date will have to abide by any state laws.

adequate assessment of the borrower's repayment ability. However, when a credit becomes troubled, the primary source of repayment often shifts from the borrower's capacity to repay to the value of the collateral. For these reasons, it is important to have sound appraisal policies and procedures.

2231.0.1.1 Appraisal and Evaluation Programs

The appraisal and evaluation programs should be tailored to the lender's size, its location, and the nature of its real estate market and attendant real estate–related activity. These programs should establish prudent standards and procedures which ensure that written appraisals or evaluations are obtained and analyzed for real estate–related financial transactions before a final credit decision is made.

Appraisal and evaluation programs should also establish the manner in which the institution selects, evaluates, and monitors individuals who perform real estate appraisals or evaluations. Key elements of the programs should ensure that individuals are fairly considered for the assignment, possess the requisite expertise to satisfactorily complete the assignment, hold the proper state certification or license if applicable, and are capable of rendering a high-quality, written appraisal or evaluation.

2231.0.1.2 Real Estate Appraisal Compliance Procedures

To ensure compliance with the Board's real estate appraisal regulation and supervisory guidelines, the banking organization should have established regulatory compliance procedures for all appraisals and evaluations. The compliance review may be part of a loan officer's overall credit analysis and may take the form of a narrative or checklist. The individual who prepared the appraisal or evaluation should take corrective action for noted deficiencies. Unreliable appraisals or evaluations should be replaced before the final credit decision. Formal documentation or evidence of the review should be maintained.

Additionally, a banking organization should have comprehensive analytical procedures that focus on certain types of loans, such as large-dollar credits, loans secured by complex or specialized properties, nonresidential construction loans, or out-of-area real estate loans. The banking organization should establish criteria for identifying which appraisals should be considered for more comprehensive analytical procedures. These comprehensive analytical procedures should be designed to verify the appropriateness of the methods and approaches used in the appraisal and assess the reasonableness of the appraiser's analysis, opinions, and conclusions.

Formal documentation to support the comprehensive analytical procedures should be maintained. An individual performing this analysis, either an employee of the banking organization or an outside consultant, should have real estate–related training or experience and be independent of the transaction. The individual may not change the appraisal's or evaluation's estimate of value as a result of the review—unless that person is appropriately licensed or certified and performs the review according to procedures in the Uniform Standards of Professional Appraisal Practice (USPAP), standard 3.

2231.0.1.3 Reappraisals and Reevaluations

A program should be developed for obtaining reappraisals or reevaluations as part of a program of prudent portfolio review and monitoring techniques—even when additional financing is not being contemplated. Examples include large-credit exposures and out-of-area loans. The decision to reappraise or reevaluate the real estate collateral for a subsequent transaction should be guided by the appraisal exemption for renewals, refinancings, and other subsequent transactions. Loan workouts, debt restructurings, loan assumptions, and similar transactions involving the addition or substitution of borrowers may qualify for the exemption for renewals, refinancings, and other subsequent transactions. Use of this exemption, however, depends upon the condition and quality of the loan, the soundness of the underlying collateral, and the validity of the existing appraisal or evaluation.

A loan may be renewed or refinanced based on a valid appraisal or evaluation if the planned future use of the property is consistent with the use identified in the appraisal or evaluation. However, if the property has reportedly appreciated because of a planned change in use, such as rezoning, an appraisal would be required for a federally related transaction—unless another exemption applied (for example, if the amount financed is below the appraisal threshold).

While the Board's appraisal regulation generally allows appropriate evaluations of real estate collateral in lieu of an appraisal for loan renewals and refinancings, in certain situations an appraisal is required. If new funds in excess of reasonable closing costs are advanced, a new appraisal for the renewal of an existing transaction should be obtained when there is a material change in market conditions that threatens the banking organization's real estate collateral protection.

For loan workouts, a reappraisal or reevaluation may be prudent, even if it is obtained after the modification. If there is an expected delay in obtaining the appraisal or evaluation, the banking organization should first protect its interest to facilitate the orderly collection of the loan or to reduce the risk of loss. In a troubled-loan situation, a reappraisal would not be required when a banking organization advances funds to protect its interest in a property, such as to repair damaged property, because these funds are being used to restore the damaged property to its original condition.

Real estate posted as collateral that has been acquired by a banking organization through foreclosure or deed in lieu of qualifies for the appraisal exemption for subsequent transactions. Therefore, the banking organization is only required to have an evaluation but may first initiate the foreclosure proceedings to protect its collateral interests before obtaining the evaluation. Because the sale or disposal and the financing of the sale of other real estate owned (OREO) do not arise from an existing extension of credit, these OREO transactions do not qualify for the appraisal exemption. Thus, a banking organization is required to have a valid appraisal to support the sale of OREO unless the transaction qualifies for another appraisal exemption. If the banking organization already has a valid appraisal (or an evaluation) of the real estate, it need not obtain a new appraisal.

2231.0.2 TRANSACTIONS NOT REQUIRING THE SERVICES OF A LICENSED OR CERTIFIED APPRAISER

The Board has determined that certain categories of real estate–related financial transactions do not require the services of a certified or licensed appraiser and, as such, are not considered federally related transactions.

Transactions not requiring the services of a certified or licensed appraiser include transactions in which—

1. the transaction value[4] is $250,000 or less;
2. a lien on real property has been taken as collateral in an abundance of caution;
3. the transaction is not secured by real estate;
4. a lien on real estate has been taken for purposes other than the real estate's value;
5. the transaction is a business loan that has a transaction value of $1 million or less and is not dependent on the sale of, or rental income derived from, real estate as the primary source of repayment;
6. a lease of real estate is entered into, unless the lease is the economic equivalent of a purchase or sale of the leased real estate;
7. the transaction involves an existing extension of credit at the lending institution, provided that there has been no obvious and material change in market conditions or physical aspects of the property that threatens the adequacy of the institution's real estate collateral protection after the transaction, even with the advancement of new monies, or there is no advancement of new monies, other than funds necessary to cover reasonable closing costs;
8. the transaction involves the purchase, sale, investment in, exchange of, or extension of credit secured by a loan or interest in a loan, pooled loans, or interests in real property, including mortgage-backed securities, and each loan or interest in a loan, pooled loan, or real property interest met the Board's regulatory requirements for appraisals at the time of origination;
9. the transaction is wholly or partially insured or guaranteed by a U.S. government agency or U.S. government–sponsored agency;
10. the transaction either qualifies for sale to a U.S. government agency or U.S. government–sponsored agency, or involves a residential real estate transaction in which the appraisal conforms to the Federal National Mortgage Association or Federal Home Loan Mortgage Corporation appraisal standards applicable to that category of real estate;

4. *Transaction value* is defined as the amount of the loan or extension of credit under consideration. For a pool of loans or a mortgage-backed security, the transaction value is the amount of each individual loan. In determining transaction value, the senior and junior debt are considered separate transactions under the appraisal rule. However, a series of related transactions will be considered one transaction if it appears that an institution is attempting to avoid the appraisal requirement by structuring the transactions below the appraisal threshold.

11. the regulated institution is acting in a fiduciary capacity and is not required to obtain an appraisal under any other law;
12. the transaction involves underwriting or dealing in mortgage-backed securities;[5] or
13. the Board determines that the services of an appraiser are not necessary to protect federal financial and public policy interests in real estate–related financial transactions or to protect the safety and soundness of the institution.

For transactions below the appraisal threshold, qualifying for the $1 million or less business-loan exemption, or qualifying for the existing extension-of-credit exemption, the Board still requires an appropriate evaluation of the real property collateral that is consistent with safe and sound banking practices.

The Board reserves the right to require an appraisal on an exempt transaction whenever it is necessary to address safety-and-soundness concerns. Whether a banking organization will be required to obtain an appraisal for a particular transaction or an entire group of credits will depend on its condition. For example, if a banking organization is in troubled condition that is attributable to underwriting problems in its real estate loan portfolio, the Board may require the banking organization to obtain an appraisal for all new transactions below the threshold. However, regardless of a banking organization's condition, an examiner may require an appraisal for a particular real estate–related transaction to address safety-and-soundness concerns.

2231.0.3 OBTAINING AN APPRAISAL

The banking organization or its agent is responsible for engaging the appraiser and must have sufficient time to analyze the appraisal as part of its decision process to enter into the transaction. A banking organization may not accept an appraisal prepared for a potential borrower as the appraisal for a federally related transaction. An appraisal obtained by a financial services institution may be used by a federally regulated institution so long as procedures have been established for reviewing appraisals, the review indicates that the appraisal meets the regulation's requirements, and the review is documented in writing.

For a multiphased development or construction loan, the appraisal of an earlier phase cannot be used for a new phase due to the change in risk. However, if the original appraisal was prepared for all phases of the project, the project appraisal may be used if the appraisal's value for the new phase is still valid at the time additional credit is extended.

2231.0.4 USEFUL LIFE OF AN APPRAISAL

Since a banking organization may wish to use an existing appraisal or evaluation for a subsequent loan or investment, its appraisal and evaluation program should include criteria to determine the validity of an existing appraisal or evaluation. The useful life of an appraisal will vary, depending on the circumstances surrounding the property and the marketplace. When deciding if an appraisal or evaluation may be used for a subsequent transaction, a banking organization should determine if any material changes to the underlying assumptions have occurred that would affect the original estimate of value.

Examples of factors that could cause material changes to reported values include the passage of time; the volatility of the local market; the availability of financing; the inventory of competing properties; new improvements to, or lack of maintenance of, the subject or competing, surrounding properties; a change in zoning; or environmental contamination. The banking organization should document its information sources and analyses used to determine if an existing appraisal or evaluation remains valid. It should also document whether the banking organization will be using that appraisal or evaluation in a subsequent transaction.

2231.0.5 APPRAISAL REQUIREMENTS

The objective of an appraisal is to communicate the appraiser's reasoning and conclusions logically so that the reader is led to the appraiser's estimation of market value. The contents of appraisals should conform to the standards of the Board's appraisal regulation and to those established in USPAP as promulgated by the Appraisal Standards Board of the Appraisal Foundation. The actual form, length, and content of appraisal reports may vary, depending on the type of property being appraised and the nature of the assignment. Standard forms com-

5. This Regulation Y exemption from the Board's appraisal standards was effective on December 28, 1998.

pleted in compliance with the regulation and USPAP are also acceptable.

2231.0.5.1 Appraisal Standards

The minimum standards for appraisals performed in connection with federally related transactions are those set forth in USPAP, as well as any other standards that the Board deems necessary. In summary, an appraisal must—

1. conform to the generally accepted appraisal standards as evidenced by USPAP, unless principles of safe and sound banking require compliance with stricter standards;
2. be written and contain sufficient information and analysis to support the banking organization's decision to engage in the transaction;
3. analyze and report appropriate deductions and discounts for proposed construction or renovation, partially leased buildings, nonmarket lease terms, and tract developments with unsold units;
4. be based on the definition of market value as set forth in the regulation; and
5. be performed by state-licensed or -certified appraisers in accordance with the requirements in the regulation.

The Board's appraisal regulation also permits banking organizations to use appraisals prepared according to the USPAP Departure Provision, which permits limited exceptions to ‘‘specific guidelines’’ in USPAP. Appraisers using the Departure Provision still must comply with all ‘‘binding requirements’’ of USPAP and must be sure that the resulting appraisal will not be misleading.

2231.0.5.2 Appraisal Assignment

A banking organization may engage an appraiser to perform an appraisal assignment, either a complete or a limited appraisal. In a complete appraisal assignment, an appraiser must meet all USPAP standards and guidelines in estimating market value. In a limited appraisal assignment, the appraiser elects to depart from certain specific guidelines by invoking the Departure Provision. Before beginning the appraisal, the appraiser must obtain the banking organization's concurrence that the use of the Departure Provision is appropriate for the transaction. The appraiser must ensure that the resulting appraisal report will not mislead the banking organization or other intended users of the appraisal report. The banking organization should realize that as the degree of departure increases, the extent of reliability of the limited appraisal decreases, resulting in a higher level of risk.

2231.0.5.3 Appraisal Reports

The appraisal report usually includes a disclosure of sales history and an opinion as to the highest value and best use of the property. After preparing a report, appraisers must certify that—

1. statements of fact are true and correct,
2. limiting conditions have been disclosed,
3. they have no interest (present or future) in the transaction or property,
4. compensation is not contingent on rendering a specified value,
5. they have complied with USPAP,
6. an inspection of the property was or was not performed, and
7. assistance was or was not received in the preparation of the appraisal.

Three different report formats can be used for either the complete or the limited appraisal assignment: a self-contained report, a summary report, and a restricted report. Since USPAP requires all appraisal reports to encompass all aspects of the assignment, reports will differ based on the degree of detail presented. The self-contained appraisal report provides the most detail; the summary appraisal report condenses the information; and the restricted appraisal report presents minimal information, with supporting details maintained in the appraiser's work files.

The restricted report is not appropriate for a significant number of federally related transactions because the minimal amount of information limits the usefulness of the document for underwriting, compliance, and other decision-making purposes. However, a restricted report might be used when providing ongoing collateral monitoring of a banking organization's real estate transactions and under other circumstances when a banking organization's program requires an evaluation.

2231.0.5.4 Appraisal Content

The appraisal must reflect a market value of the real estate. The regulation defines market value as the most probable price that a property should bring in a competitive and open market under all conditions requisite to a fair sale, the buyer and seller each acting prudently and knowledgeably, and assuming the price is not affected by undue stimulus. Implicit in this definition is the consummation of a sale as of a specified date and the passing of title from the seller to the buyer under conditions whereby—

1. the buyer and seller are typically motivated,
2. both parties are well informed or well advised and acting in what they consider their own best interests,
3. a reasonable time is allowed for exposure in the open market,
4. payment is made in terms of cash in U.S. dollars or in terms of financial arrangements comparable thereto, and
5. the price represents the normal consideration for the property sold, unaffected by special or creative financing or sales concessions granted by anyone associated with the sale.

To properly underwrite a construction loan, a banking organization may need to know the prospective value of a property and its market value as of the appraisal date. Prospective value is based on events yet to occur, such as completion of construction or renovation, reaching stabilized occupancy, or some other event yet to be determined. Thus, more than one value may be reported in an appraisal as long as all values are clearly described and reflect the projected dates when future events could occur. Assumptions and projections used to develop prospective value estimates must be fully supported and reasonable in light of current market conditions.

2231.0.6 APPRAISAL VALUATION APPROACHES

The appraiser typically uses three market-value approaches to analyze the value of property:

1. cost approach
2. comparable-sales approach
3. capitalization-of-income approach

All three approaches have particular merits depending on the type of real estate being appraised. For single-family residential property, the cost and comparable-sales approaches are most frequently used since the common use of the property is the personal residence of the owner. However, if a single-family residential property is intended to be used as a rental property, the appraiser would have to consider the income approach as well as the cost and comparable-sales approaches. For special-use commercial properties, the appraiser may have difficulty obtaining sales data on comparable properties and may have to base the value estimate on the cost and capitalization of income approach. If an approach is not used in the appraisal, the appraiser should disclose the reason the approach was not used and whether this had an impact on the value estimate.

2231.0.6.1 Value Correlation

The three value estimates—cost, market, and income—must be evaluated by the appraiser and correlated into a final value estimate based on the appraiser’s judgment. Correlation does not imply averaging the value estimates obtained by using the three different approaches. When these value estimates are relatively close together, correlating them and setting the final market-value estimate presents no special problem. However, if widely divergent values are obtained by using the three appraisal approaches, the appraiser must exercise judgment in analyzing the results and determining the estimate of market value.

2231.0.6.1.1 Cost Approach

In the cost approach to value estimation, the appraiser obtains a preliminary indication of value by adding the estimated depreciated reproduction cost of the improvements to the estimated land value. This approach is based on the assumption that the reproduction cost is the upper limit of value and that a newly constructed building would have functional and mechanical advantages over an existing building. The appraiser would evaluate any depreciation, that is, disadvantages or deficiencies, of the existing building in relation to a new structure.

The cost approach consists of four basic steps: (1) estimate the value of the land as though vacant, (2) estimate the current cost of reproducing the existing improvements, (3) estimate depreciation and deduct from the reproduction-cost estimate, and (4) add the estimate of land value and the depreciated reproduction cost of improvements to determine the value estimate.

2231.0.6.1.2 Comparable-Sales Approach

The focus of this approach is to determine the recent sales price of similar properties. Through an appropriate adjustment for differences in the subject property and the selected comparable properties, the appraiser estimates the market value of the subject property based on the sales price of the comparable properties. To determine the extent of comparability of two or more properties, the appraiser must judge their similarity with respect to age, location, condition, construction, layout, and equipment. The sales or list price of those properties that the appraiser determines to be most comparable will tend to set the range for the value of the subject property.

2231.0.6.1.3 Income Approach

The income approach estimates the project's expected income over time converted to an estimate of its present value. The income approach typically is used to determine the market value of income-producing properties such as office buildings, apartment complexes, hotels, and shopping centers. In the income approach, the appraiser can use several different capitalization or discounted-cash-flow techniques to arrive at a market value. These techniques include the band-of-investments method, mortgage-equity method, annuity method, and land-residual technique. The use of a particular technique will depend on whether there is project financing, there are long-term leases with fixed-level payments, and the value is being rendered for a component of the project such as land or buildings.

The accuracy of the income approach depends on the appraiser's skill in estimating the anticipated future net income of the property and in selecting the appropriate capitalization rate and method. The following data are assembled and analyzed to determine potential net income and value:

1. Rent schedules and the percentage of occupancy for the subject property and for comparable properties for the current year and several preceding years. This information provides gross rental data and the trend of rentals and occupancy, which are then analyzed by the appraiser to estimate the gross income the property should produce.
2. Expense data such as taxes, insurance, and operating costs being paid from revenues derived from the subject property and comparable properties. Historical trends in these expense items are also determined.
3. Timeframe for achieving "stabilized" or normal occupancy and rent levels (also referred to as holding period).
4. An appropriate capitalization rate and valuation technique, selected and applied to net income to establish a value estimate.

Basically, the income approach converts all expected future net operating income into a value estimate. When market conditions are stable and no unusual patterns of future rents and occupancy rates are expected, the direct-capitalization method is used to value income properties. This method calculates the value of a property by dividing an estimate of its stabilized annual income by a factor called a "cap" rate. Stabilized income generally is defined as the yearly net operating income produced by the property at normal occupancy and rental rates; it may be adjusted upward or downward from today's actual market conditions. The cap rate—usually defined for each property type in a market area—is viewed by some analysts as the required rate of return stated in terms of current income.

The use of this technique assumes that either the stabilized income or the cap rate, used accurately, captures all relevant characteristics of the property relating to its risk and income potential. If the same risk factors, required rate of return, financing arrangements, and income projections are used, explicit discounting and direct capitalization will yield the same results.

For special-use properties, new projects, or troubled properties, the discounted-cash-flow (net present value) method is the more typical approach to analyzing a property's value. In this method, a timeframe for achieving a stabilized or normal occupancy and rent level is projected. Each year's net operating income during that period is discounted to arrive at the present value of expected future cash flows. The property's anticipated sales value at the end of the stabilization period (its terminal or reversion value) is then estimated. The reversion value represents the capitalization of all future income streams of the property after the projected occupancy level is achieved. The terminal or reversion value is then discounted to its present value and added to the discounted income stream to arrive at the total present market value of the property.

Most importantly, the analysis should be based on the ability of the project to generate income over time based on reasonable and supportable assumptions. Additionally, the discount rate should reflect reasonable expectations about the rate of return that investors require under normal, orderly, and sustainable market conditions.

2231.0.7 OTHER DEFINITIONS OF VALUE

The Board's appraisal regulation requires that the appraisal contain a market value of the real estate collateral. Some other definitions of value that are encountered when appraising and evaluating real estate transactions are described below.

1. *Fair value* is an accounting term that is generally defined as the amount in cash or cash-equivalent value or other consideration that a real estate parcel would yield in a current sale between a willing buyer and a willing seller (selling price), other than a forced or liquidation sale.[6] According to accounting literature, fair value is generally used in valuing assets in nonmonetary transactions, troubled-debt restructuring, quasi-reorganizations, and business combinations accounted for by the purchase method. An accountant generally defines fair value as market value; however, depending on the circumstances, these values may not be the same for a particular property.
2. *Investment value* is based on the data and assumptions that meet a particular investor's criteria and objectives for a specific property or project. The investor's criteria and objectives are often substantially different than those of participants in a broader market. Thus, investment value can be significantly higher than market value in certain circumstances and should not be used in credit-analysis decisions.
3. *Liquidation value* assumes that there is little or no current demand for the property and that the property needs to be disposed of quickly. In this situation, the owner may have to sacrifice property appreciation for an immediate sale.
4. *Going-concern value* is based on the value of the business entity, rather than the value of the real estate. The valuation is based on the existing operations of a business that has a proven operating record, with the assumption that the business will continue to operate.
5. *Assessed value* represents the value on which a taxing authority bases its assessment. The assessed value and market value may differ considerably due to tax assessment laws, timing of reassessments, and tax exemptions allowed on properties or portions of a property.
6. *Net realizable value (NRV)* is recognized under generally accepted accounting principles[7] as "the estimated selling price in the ordinary course of business less estimated costs of completion (to the stage of completion assumed in determining the selling price), holding, and disposal." The NRV is generally used to evaluate the carrying amount of assets being held for disposition and properties representing collateral. While the market value or future selling price is generally used as the basis for the NRV calculation, the NRV also reflects the current owner's costs to complete the project and to hold and dispose of the property. For this reason, the NRV will generally be less than the market value.

The appraiser should state the definition of value reported in the appraisal, and, for federally related transactions, the value must meet the definition of market value in the regulation. This is the most probable price that a property should bring in a competitive and open market under all conditions requisite to a fair sale, assuming the buyer and seller are both acting prudently and knowledgeably, and the price is not affected by undue stimulus. Other presentations of value, in addition to market value, are allowed and may be included in the appraisal at the request of the banking organization.

2231.0.8 EVALUATION REQUIREMENTS

The Board's appraisal regulation requires an evaluation for certain real estate–related financial transactions that are exempt from the title XI appraisal requirement. These transactions include—

6. FASB Statement No. 67, "Accounting for Costs and Initial Rental Operations of Real Estate Projects," Appendix A—Glossary.

7. FASB Statement No. 67, "Accounting for Costs and Initial Rental Operations of Real Estate Projects," Appendix A—Glossary.

1. transactions below the $250,000 threshold;
2. transactions qualifying for the exemption for business loans of $1 million or less, when rental income or sales proceeds from real estate is not the primary source of repayment; and
3. subsequent transactions resulting from an existing extension of credit (for example, renewals and refinancings).

An evaluation should provide a general estimate of the value of the real estate and need not meet the detailed requirements of a title XI appraisal.[8] An evaluation must provide appropriate information to enable the banking organization to make a prudent decision regarding the transaction. Moreover, a banking organization is not precluded from obtaining an appraisal that conforms to the regulation for any exempt transaction. At a minimum, an evaluation should—

1. be written;
2. include the preparer's name, address, and signature, and the effective date of the evaluation;
3. describe the real estate collateral, its condition, and its current and projected use;
4. describe the sources of information used in the analysis;
5. describe the analysis and supporting information; and
6. provide an estimate of the real estate's market value, with any limiting conditions.

2231.0.8.1 Form and Content of Evaluations

The documentation for evaluations should fully support the estimate of value and include sufficient information to understand the evaluator's analysis, assumptions, and conclusions. The evaluator is not required to use a particular form or valuation approach, but the analysis should apply to the type of property and fully explain the value rendered.

An individual who conducts an evaluation should have real estate–related training or experience relevant to the type of property. However, the individual does not have to be a state-licensed or -certified appraiser. Prudent practices require that a more detailed evaluation be performed as the banking organization engages in more complex real estate–related financial transactions or as its overall exposure in a real estate–related financial transaction increases.

An evaluation for a transaction that needs a more detailed analysis should describe the property; give its location; and discuss its use, especially for nonresidential property. An evaluation for a transaction that requires a less detailed analysis may be based on information such as comparable property sales information from sales-data services (for example, the multiple-listing service or current tax-assessed value in appropriate situations).[9] Further, an evaluation may be based on the banking organization's own real estate loan portfolio experience and on value estimates prepared for recent loans on comparable properties, when appraisals meeting the regulatory requirements were obtained. Regardless of the method, the banking organization must document its analysis and findings in the loan file.

2231.0.9 SELECTION AND QUALIFICATIONS CRITERIA FOR APPRAISERS AND EVALUATORS

The accuracy of an appraisal or evaluation depends on the competence and integrity of the individual performing the appraisal or evaluation, as well as on that person's expertise at developing and interpreting pertinent data for the subject property. Appraisers and evaluators should have adequate training, experience, and knowledge of the local real estate market to make sound judgments concerning the value of a particular property. Their level of training, experience, and knowledge should be commensurate with the type and complexity of the property to be valued. Additionally, appraisers and evaluators should be independent of the credit decision, have no interest in the property being appraised, and have no affiliations or associations with the potential borrower. Absent absolute lines of independence, a banking organization must be able to demonstrate that it has prudent safeguards in place to isolate its collateral-evaluation process from influence or interference from the loan-production process.

8. An appraisal means the kind of specialized opinion on the value of real estate that contains certain formal elements recognized by appraisal industry practices and standards.

9. Assessed values for tax purposes may be a specified fraction of market value, as determined by the tax assessor. Therefore, tax-assessed values should be adjusted to a market-value equivalent. In cases where the assessed value does not have a reliable correlation to current value, the use of assessed value would be inappropriate as the basis for an evaluation.

2231.0.9.1 Appraiser Qualifications

Title XI of FIRREA identified two classifications of appraisers to be used in federally related transactions: state-certified appraisers and state-licensed appraisers. For a state-certified appraiser, title XI anticipated that the states would adopt similar standards for certification based on the qualification criteria of the Appraiser Qualifications Board of the Appraisal Foundation. The Appraisal Foundation standards set forth minimum educational, testing, experience, and continuing-education requirements. For a licensed appraiser, the states have some latitude to establish qualification standards, provided criteria are adequate to protect federal financial and public policy interest.

The Appraisal Subcommittee of the FFIEC is responsible for monitoring state compliance with title XI. The Board also has the authority to impose additional certification and licensing requirements on those adopted by a given state.

2231.0.9.2 Selection of an Appraiser

An independent appraisal is one in which the appraiser is not participating in the administration of the credit or in the approval of the transaction and has no interest, financial or otherwise, in the property. In certain instances involving small banking organizations, officers and directors who perform appraisals must take appropriate steps to ensure that they are independent from the transaction under consideration.

When selecting an appraiser for an appraisal assignment, a banking organization is expected to consider whether the individual holds the proper state certification or license and has the appropriate experience and educational background to complete the assignment. Financial institutions may not exclude a qualified appraiser from consideration for an appraisal assignment solely because the appraiser lacks membership in a particular appraisal organization or does not hold a particular designation from an appraisal association, organization, or society.

In that regard, banking organizations are expected to treat all appraisers fairly and equitably in determining whether to use the services of a particular appraiser. Generally, banking organizations have established procedures for selecting appraisers and maintaining an approved appraiser list. The practice of pre-approving appraisers for ongoing appraisal work and maintaining an approved appraiser list is acceptable so long as all appraisers are required to follow the same approval process. However, a banking organization that requires appraisers who are not members of a particular appraisal organization to formally apply, pay an application fee, and submit samples of previous appraisal reports for review—but does not have identical requirements for appraisers who are members of other appraisal organizations—would be viewed as having a discriminatory selection process.

2231.0.9.3 Appraisals Performed by Certified or Licensed Appraisers

In summary, a banking organization is required to use a certified appraiser for (1) all federally related transactions over $1 million, (2) nonresidential federally related transactions of more than $250,000, and (3) complex residential federally related transactions of more than $250,000.[10] A banking organization may use either a state-certified or a state-licensed appraiser for noncomplex residential federally related transactions that are under $1 million.

2231.0.9.4 Other Appraiser Designations

Some states have adopted other appraiser designations that may cause confusion about whether a particular appraiser holds the appropriate designation for a given appraisal assignment. Additionally, some states use designations such as ‘‘certified residential’’ appraiser and ‘‘certified general’’ appraiser, which leads to further confusion. Other states have no specified license designation but have used the term ‘‘certified residential’’ based on the standards for licensing. For this reason, a banking organization needs to understand the qualification criteria set forth by the state appraiser regulatory body and whether these standards are equivalent to the federal designations accepted by the Appraisal Subcommittee.

The Appraisal Subcommittee has recognized two other appraiser designations: certified residential appraiser and transitional licensed appraiser. For the certified residential appraiser, the minimum qualification standards are those

10. Complex one- to four-family residential property appraisal means one in which the property to be appraised, the form of ownership, or the market conditions are atypical.

established by the Appraiser Qualifications Board for “certified residential real estate appraiser.” Under the Board’s regulation, a certified residential appraiser would be permitted to appraise real estate in connection with a federally related transaction designated for a “certified” appraiser, provided the individual is competent for the particular appraisal assignment.

The Appraisal Subcommittee and the Board are also willing to recognize a transitional license that would allow a state to issue a license to an appraiser, provided the individual has passed an examination and has satisfied either the education or experience requirement. A transitional licensed appraiser is permitted to appraise real estate collateral in connection with a federally related transaction as if licensed. The transitional licensed appraiser is expected to complete the missing requirement within a set timeframe or the license expires. Recognition of a transitional license was believed to be necessary to ease the initial problems and inefficiencies resulting from a new regulatory program. The Appraisal Subcommittee has advised the states that the use of the transitional licenses should be phased out once the appraiser regulatory program is fully established. As a result, the use of a transitional license and the applicable timeframe will vary from state to state.

2231.0.9.5 Qualifications of Individuals Who Can Perform Evaluations

Evaluations can be performed by a competent person who has experience in real estate–related activities, including, but not limited to, appraisals, real estate lending, real estate consulting, and real estate sales. A banking organization may also augment in-house expertise by hiring an outside consultant familiar with a certain market or a particular type of real estate. The evaluation procedures should have established standards for selecting qualified individuals to perform evaluations and for confirming their qualifications and independence to evaluate a particular transaction. An individual performing an evaluation need not be licensed or certified. However, if a banking organization desires, it may use state-licensed or -certified appraisers to prepare evaluations.

2231.0.10 EXAMINER REVIEW OF APPRAISAL AND EVALUATION POLICIES

A banking organization’s appraisal and evaluation policies and procedures will be reviewed as part of the inspection of the organization’s overall activities. This includes a review of the procedures for selecting an appraiser for a particular appraisal or evaluation assignment and for confirming that the appraiser is qualified, independent, and if applicable, licensed or certified to undertake the assignment. If an institution maintains a listing of qualified real estate appraisers acceptable for the banking organization’s use, the examiner should ascertain whether the board of directors or senior management has reviewed and approved the list.

If a banking organization is in troubled condition that is attributable to underwriting problems in its real estate loan portfolio, the Board may require the banking organization to obtain appraisals for all new real estate–related financial transactions below the threshold that are not subject to another exemption. The Reserve Bank will determine if a particular banking organization will have to obtain appraisals below the threshold.

When analyzing individual credits, examiners will analyze appraisals or evaluations to determine that the methods, assumptions, findings, and conclusions are reasonable and comply with the Board’s rule, policies, and supervisory guidelines. Examiners should not challenge the underlying assumptions, including the discount and capitalization rates used in appraisals, that differ only in a limited way from norms that would generally be associated with the property under review. Furthermore, an examiner is not bound to accept the appraisal or evaluation results, regardless of whether a new appraisal or evaluation was requested during the examination. An examiner who concludes that an appraisal or evaluation is deficient for any reason will take that fact into account when judging the quality of the credit.

When the examiner can establish that the underlying facts or assumptions are inappropriate and can support alternative assumptions, he or she may adjust the estimated value of the property for credit-analysis purposes. It is important to emphasize that an examiner’s overall analysis and classification of a credit may be based on other credit or underwriting standards, even if the loan is secured by real property whose value is supported by an appraisal or evaluation.

Significant failures to meet standards and procedures as outlined above will be criticized and corrective action will be required. Furthermore, banking organizations that fail to maintain a sound appraisal or evaluation program or that fail to comply with the agencies' appraisal regulations and policies, or to the Board's supervisory guidelines, will be cited in inspection reports and may be criticized for unsafe and unsound banking practices. Deficiencies will require corrective action.

The appraisal regulation and guidelines require that banking organizations use the services of qualified, independent, and certified or licensed appraisers to perform appraisals. Furthermore, a banking organization that knowingly uses the services of an individual who is not properly certified or licensed to perform an appraisal in connection with a federally related transaction is violating the Board's Regulation Y. Any action of a state-certified or -licensed appraiser that is contrary to the purpose of title XI should be reported to the Federal Reserve Bank for referral to the appropriate state appraiser regulatory agency for investigation.

2231.0.11 INSPECTION OBJECTIVES

1. To determine whether policies, practices, procedures, and internal controls regarding real estate appraisals and evaluations for real estate–related financial transactions are adequate.
2. To determine whether the banking organization's officers and employees are conforming with the board of directors' appraisal policies.
3. To determine whether appraisals performed in connection with federally related transactions comply with the minimum standards of the Board's appraisal regulation and the Uniform Standards of Professional Appraisal Practice.
4. To determine if appraisers used in connection with federally related transactions are certified or licensed as appropriate.
5. To determine whether appraisers are competent to render appraisals in federally related transactions and whether they are independent of the specific transaction or other lending, investment, or collection functions as appropriate.
6. To initiate corrective action when policies, practices, procedures, or internal controls are deficient, or when violations of laws or regulations or noncompliance with provisions of supervisory guidelines have been noted.

2231.0.12 INSPECTION PROCEDURES

1. Test real estate–related financial transactions for compliance with approved real estate appraisal policies and established practices, procedures, and internal controls. Also, obtain a listing of any deficiencies noted in the latest review performed by internal and/or external auditors and determine if appropriate corrections have been made. Based on these results, determine the scope of the inspection for appraisals.
   a. Provide copies of the banking organization's appraisal and evaluation policies and procedures to examiners assigned to functional areas when real estate–related transactions may require the services of an appraiser or evaluator.
   b. Review appraisals and evaluations of individual real estate–related transactions during the inspection of loans, BHC premises, DPC assets, or OREO transactions. Review the appraisals and evaluations for compliance with the Board's appraisal regulation and appraisal guidelines and with the banking organization's appraisal and evaluation programs.
   c. When real estate–related transactions are examined on a portfolio basis, review the appraisal and evaluation processes. Determine whether the processes ensure that appraisals and evaluations comply with the Federal Reserve Board's appraisal regulation, the interagency appraisal guidelines, and the banking organization's appraisal and evaluation programs.
2. When performing the above procedures, determine whether—
   a. the board of directors approves and periodically reviews the appraisal policies and procedures that establish the appraisal and evaluation programs for real estate lending, as required by the Board's real estate lending regulation;
   b. the appraisal and evaluation programs include comprehensive analytical procedures;
   c. the banking organization engages competent individuals who are independent of the transaction to perform appraisals and evaluations, and whether the appraisal and evaluation programs establish the manner in which it selects, evaluates, and monitors those individuals;
   d. the appraisal program ensures that appraisals conform to the Board's appraisal regulation;
   e. the evaluation program ensures that eval-

uations conform to the Board's guidance on evaluations (SR-94-55 and SR-94-50);
f. the appraisal and evaluation programs appropriately reflect the banking organization's size, its location, and the nature and complexity of its real estate–related activities;
g. policies and procedures require appraisals and evaluations to be written;
h. criteria have been established for determining when to obtain reappraisals or reevaluations as part of a program of prudent portfolio review and monitoring; and
i. the banking organization has appropriate procedures to assess the validity of appraisals and evaluations for certain subsequent transactions that are exempt from the Board's appraisal requirements, or whether new appraisals or evaluations were obtained.

3. Review and assess the banking organization's compliance procedures to ensure that the appraisal and evaluation programs are effective and in compliance with regulatory requirements and that they review the appropriateness of appraisals and evaluations before final credit decisions. Determine if—
   a. The monitoring procedures demonstrate that appraisals and evaluations comply with the Board's appraisal regulation and the Board's appraisal and evaluation guidelines.
   b. The program provides that appraisals and evaluations are obtained before the final credit or other decision. However, for transactions involving loan workouts or restructurings to facilitate the orderly collection of the credit or to reduce the risk of loss, appraisals or evaluations were obtained in a reasonable time after the transaction occurs.
   c. The programs have review procedures to verify that the methods, assumptions, and conclusions in the appraisals or evaluations are reasonable and appropriate for the transaction and the property.
   d. Criteria are established to identify which transactions should have their appraisal or evaluation considered for more comprehensive analytical procedures. For example, certain types of transactions, such as large-dollar credits, loans secured by complex or specialized properties, nonresidential real estate construction loans, or out-of-area real estate, should ensure that the appraisal or evaluation provides adequate support for the particular transaction.
   e. The banking organization ensures that individuals who perform these reviews have appropriate training and experience and are independent of the transaction.
   f. There is adequate documentation to demonstrate that the review has occurred. While a checklist may serve this purpose for many of these transactions, a more comprehensive review would require a more detailed written analysis.
   g. Appropriate procedures exist for any deficiencies noted in the review, thus requiring (1) the individual who prepared the appraisal or evaluation to correct the deficiencies or (2) a new appraisal or evaluation to be obtained before the final credit or other decision.
   h. The program ensures that changes of an appraisal's estimate of value were made in accordance with standard 3 of the Uniform Standards of Professional Appraisal Practice (USPAP), and whether the changes were made by an appropriately qualified licensed or certified appraiser.
   i. Appropriate procedures exist for referring potential cases of misconduct by licensed and certified appraisers to the appropriate state appraiser regulatory authority.

4. Assess the procedures for determining whether a real estate–related transaction requires an appraisal or evaluation, or is otherwise exempt from the Board's appraisal regulation.
   a. For appraisals required under the appraisal program, determine that—
      • the banking organization engaged the appraiser or, if the appraiser was engaged directly by another financial services entity, the banking organization determined that the appraisal complies with its own program and the Board's appraisal regulation. (The banking organization may *not* accept an appraisal prepared for the borrower.);
      • the appraisal was obtained in sufficient time to be analyzed before the final credit or other decision;
      • the appraisal conforms to the generally accepted appraisal standards as evidenced by USPAP, for example—
         — the appraiser uses the three market-value approaches—cost, comparable sales, and income—and corre-

lates the results into a final value estimate;
- — if the above-mentioned approaches were not used, the appraiser discloses the reason and whether this affected the value estimate;
- — the appropriate type of appraisal was obtained (complete or limited), and the appropriate report format (self-contained, summary, or restricted) was used for the particular transaction; and
- — if a limited appraisal was used (that is, the appraiser invoked the Departure Provision), the appraisal fully discloses the limiting conditions;

- the appraisal is written and contains sufficient information and analysis to support the banking organization's decision to enter into the transaction;
- if the appraisal is for proposed construction or renovation, partially leased buildings, nonmarket lease terms, or tract developments with unsold units, the appraisal includes an appropriate analysis and disclosure of deductions and discounts for holding costs, marketing costs, leasing commissions, rent losses, tenant improvements, and entrepreneurial profits;
- the appraisal contains an estimate of the current market value of the property in its actual physical condition and current zoning, as defined by the Board's appraisal regulation;
- the appraisal contains an estimate of the property's prospective market value based on the completion of improvements or stabilized occupancy, if the appraisal is for a property where improvements or renovations are to be made;
- the appraisal clearly identifies each value estimate and, for the prospective value, gives the projected dates when future events are expected to occur when more than one estimate of value is reported;
- the individual who performed the appraisal was independent of the transaction and appropriately licensed and certified for the assignment:
  - — A certified appraiser must perform the appraisal for a transaction of $1,000,000 or more, a nonresidential transaction of $250,000 or more, or a complex residential transaction of $250,000 or more.
  - — A licensed or certified appraiser must perform the appraisal for any other type of federally related transaction.
- the individual who performed the appraisal had appropriate training and experience demonstrating expertise in appraising similar types of properties and knowledge of the property's market; and
- incidents of possible appraiser misconduct are documented for possible referral by the Reserve Bank to the state appraiser regulatory agency.

b. For exempt transactions requiring an evaluation, such as transactions below the $250,000 threshold, business loans less than $1 million, and subsequent transactions, including renewals and refinancings, determine that—
- the evaluation at a minimum—
  - — is written;
  - — includes the preparer's name, address, and signature and the effective date;
  - — describes the real estate collateral, its condition, and its current and projected use;
  - — describes the source of information used in the analysis;
  - — describes the analysis and supporting information; and
  - — gives an estimate of the real estate's value with limiting conditions;
- the evaluation provides sufficient detail to support the estimate of collateral value in more complex real estate–related transactions, or when the overall exposure is high;
- the individual who performed the evaluation had the appropriate real estate training and sufficient experience and knowledge of the market to prepare the evaluation; and
- the individual who performed the evaluation, regardless of whether the banking organization's staff performed the evaluation, was independent of the transaction, credit decision, or function.

5. Assess management's compliance with its policies and procedures and with the Board's appraisal regulation and guidance by reviewing appraisals and evaluations.
6. If the review of appraisals or evaluations on one- to four-family residential loans or multi-

family loans indicates that the appraisals or evaluations do not meet the Board's requirements, or that the loan-to-value ratio at origination was higher than 80 percent for fixed-rate loans or 75 percent for floating-rate loans, then these loans may not be eligible for the 50 percent risk weight permitted under the Board's risk-based capital rule.

7. Evaluate the banking organization with respect to—
   a. the adequacy of written appraisal and evaluation programs;
   b. the methods used by the banking organization's officers to conform with established policy;
   c. internal control deficiencies or exceptions;
   d. the integrity of the appraisal and evaluation process, including appraisal and evaluation compliance procedures;
   e. the integrity of individual appraisals and evaluations for their adequacy, their reasonableness, and the appropriateness of the methods, assumptions, and techniques used, and for their compliance with the Board's appraisal regulation and real estate appraisal and evaluation guidelines;
   f. recommended corrective action when policies, practices, or procedures are deficient;
   g. the degree of any violations of the Board's appraisal regulation, and the extent of noncompliance with interagency appraisal guidelines, if noted; and
   h. the existence of other matters of significance, for example—
      - misrepresentation of data such as the omission of information on favorable financing, seller concessions, sales history, feasibility, zoning, easements, or deed restrictions;
      - inadequate techniques of analysis, that is, failure to use the cost, comparable sales, or income approach in the appraisal, when the approach is appropriate for the type of property;
      - use of dissimilar comparables in the comparable-sales approach to valuation (for example, the age, size, quality, or location of the comparable is significantly different from the subject property, making reconciliation of value difficult);
      - underestimating of factors such as construction cost, construction period, lease-up period, and rent concessions;
      - use of best-case assumptions for the income approach to valuation without performing a sensitivity analysis on the factors which would identify the lender's downside risk;
      - overly optimistic assumptions, such as a high absorption rate in an overbuilt market; and
      - demographic factors, such as existing housing inventory, projected completions, and expected market share, that are not reconciled to the value rendered, but are only discussed as background information.
8. Report any instances of questionable conduct by appraisers along with supporting documentation to the Reserve Bank for possible referral to the appropriate state appraisal authorities.
9. Update workpapers with any information that will facilitate future inspections.

2231.0.13 INTERNAL CONTROL QUESTIONNAIRE

Review the internal controls, policies, practices, and procedures for real estate appraisals and evaluations. The appraisal and evaluation system should be documented completely and concisely and should include, where appropriate, narrative descriptions, flow charts, copies of forms used, and other pertinent information. *The items marked with an asterisk (*) require substantiation by observation or testing.*

2231.0.13.1 Appraisal and Evaluation Policies

1. Has the board of directors, consistent with its duties and responsibilities, adopted written appraisal and evaluation policies that define—
   a. management's responsibility for selecting, evaluating, and monitoring the individual who is performing the appraisal or evaluation?
   b. the basis for selecting staff appraisers and engaging fee appraisers for a particular appraisal assignment? (This ensures that the individual is independent of the transaction, possesses the requisite expertise, and holds the proper state certification or license, if applicable.)
   c. the procedures as to when appraisals and evaluations should be obtained?

d. the procedures for when to obtain a reappraisal or reevaluation, including frequency and scope?
e. appraisal and evaluation compliance and review procedures? Will those procedures ascertain that the bank holding company's appraisals and evaluations are consistent with USPAP and the Board's regulations, policies, and guidelines?

2. Does the board of directors periodically review its appraisal, evaluation, and review policies and procedures to ensure that they meet the needs of the bank holding company's real estate lending activity?

2231.0.13.2 Appraisals

*1. Are appraisals in writing, dated, and signed?
*2. Does the appraisal meet the minimum standards of the Board's regulation and USPAP, including—
   a. purpose;
   b. market value;
   c. effective date;
   d. marketing period;
   e. sales history of subject property;
   f. reflection of the valuation using the cost, income, and comparable-sales approaches;
   g. evaluation and correlation of the three approaches into a final value estimate based on the appraiser's judgment;
   h. explanation of why an approach is inappropriate if not used in the appraisal; and
   i. full support for the assumptions and the value rendered through adequate documentation?
*3. Are appraisals received before making the final credit or other decision? (For example, is the date of the loan commitment letter later than the date of the appraisal—unless the loan commitment letter is conditioned on receipt of the appraisal?)
*4. If the bank holding company is depending on an appraisal obtained for another financial services institution as support for its transaction, does the bank holding company have appraisal review procedures to ensure that the appraisal meets the standards of the appraisal regulation? These types of transactions would include loan participations and mortgage-backed securities.
*5. If an appraisal for one transaction is used for a subsequent transaction, are the determinations that the appraisals are still valid sufficiently documented?

2231.0.13.3 Appraisers

1. Are appraisers fairly considered for assignments regardless of their membership or lack of membership in a particular appraisal organization?
2. Do appraisers have requisite knowledge and experience to complete the appraisal before taking the assignment?
3. Do appraisers who discover deficiencies in their expertise before taking the assignment or while performing the appraisal—
   a. disclose their lack of knowledge and/or experience to the client before accepting the assignment or when the deficiencies become readily apparent?
   b. describe in the appraisal their lack of knowledge and/or experience and the steps taken to competently complete the assignment?
4. Are appraisers independent of the transaction?
   a. Are staff appraisers independent of the lending, investment, and collection functions, and are they uninvolved, except as an appraiser, in the federally related transaction, with no direct or indirect interest, financial or otherwise, in the property?
   b. Are fee appraisers engaged directly by the banking organization or its agents, and are written assurances obtained that those appraisers have no direct or indirect interest, financial or otherwise, in the property or transaction?
5. If staff appraisers are used, does the bank holding company periodically have test appraisals performed by independent appraisers to check the organization's knowledge of trends, values, and markets?
6. If fee appraisers are used, are investigations performed to determine their qualifications and reputation?
7. Is the status of an appraiser's state certification or license verified with the state appraiser regulatory authority to ensure that the appraiser is in good standing?
8. Are fee appraisers paid the same fee whether or not the loan is granted?
9. If the transaction is outside the local geographic market, does the bank holding company engage appraisers or consultants with knowledge of the market where the real estate collateral is located?

2231.0.13.4 Evaluations

1. Are individuals performing evaluations independent of the transaction?
*2. Are evaluations required to be in writing, dated, and signed?
*3. Does the bank holding company require sufficient information and documentation to support the estimate of value and the evaluator's analysis?
*4. If an evaluation obtained for one transaction is used for a subsequent transaction, is the determination that the evaluation is still valid sufficiently documented?
*5. Are evaluations received before making the final credit decision?
*6. If the bank holding company is depending on an evaluation obtained for another financial services institution as support for its transaction, does the holding company have evaluation review procedures to ensure that the evaluation meets the Board's regulation and guidance?

2231.0.13.5 Evaluators

1. Are individuals who perform evaluations competent to complete the assignment?
2. Are evaluations prepared by individuals who are independent of the transaction?

2231.0.13.6 Reappraisals and Reevaluations

1. Is a formal reappraisal and reevaluation program followed?
2. Does the bank holding company sufficiently document and follow its criteria for obtaining reappraisals or reevaluations?

2231.0.15 APPENDIX A—GUIDELINES FOR REAL ESTATE APPRAISAL AND EVALUATION PROGRAMS

INTERAGENCY APPRAISAL AND EVALUATION GUIDELINES
October 27, 1994

Purpose

The Office of the Comptroller of the Currency (OCC), the Board of Governors of the Federal Reserve System (FRB), the Federal Deposit Insurance Corporation (FDIC), and the Office of Thrift Supervision (OTS) (the agencies) are jointly issuing these guidelines, which supersede each of the agencies' appraisal and evaluation guidelines issued in 1992.[a] These guidelines address supervisory matters relating to real estate appraisals and evaluations used to support real estate–related financial transactions and provide guidance to examining personnel and federally regulated institutions about prudent appraisal and evaluation policies, procedures, practices, and standards.

Background

Title XI of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (FIRREA) requires the agencies to adopt regulations on the preparation and use of appraisals by federally regulated financial institutions.[b] Such real estate appraisals are to be in writing and performed in accordance with uniform standards by an individual whose competency has been demonstrated and whose professional conduct is subject to effective state supervision.

Common agency regulations[c] issued pursuant to section 304 of the Federal Deposit Insurance Corporation Improvement Act of 1991 (FDICIA) also require each regulated institution to adopt and maintain written real estate lending policies that are consistent with safe and sound banking practices and that reflect consideration of the real estate lending guidelines attached to the regulation. The real estate lending guidelines state that a real estate lending program should include an appropriate real estate appraisal and evaluation program.

Supervisory Policy

An institution's real estate appraisal and evaluation policies and procedures will be reviewed as part of the examination of the institution's overall real estate–related activities. An institution's policies and procedures should be incorporated into an effective appraisal and evaluation program. Examiners will consider the institution's size and the nature of its real estate–related activities when assessing the appropriateness of its program.

When analyzing individual transactions, examiners will review an appraisal or evaluation to determine whether the methods, assumptions, and findings are reasonable and in compliance with the agencies' appraisal regulations, policies,[d] supervisory guidelines, and the institution's policies. Examiners also will review the steps taken by an institution to ensure that the individuals who perform its appraisals and evaluations are qualified and are not subject to conflicts of interest. Institutions that fail to maintain a sound appraisal or evaluation program or to comply with the agencies' appraisal regulations, policies, or these supervisory guidelines will be cited in examination reports and may be criticized for unsafe and unsound banking practices. Deficiencies will require corrective action.

Appraisal and Evaluation Program

An institution's board of directors is responsible for reviewing and adopting policies and procedures that establish an effective real estate appraisal and evaluation program. The program should—

a. FRB: "Guidelines for Real Estate Appraisal and Evaluation Programs," September 28, 1992; OCC: BC-225, "Real Estate Appraisal and Evaluation Guidelines," September 28, 1992; FDIC: FIL-69-92, "Guidelines for Real Estate Appraisal and Evaluation Programs," September 30, 1992; OTS: Thrift Bulletin 55, "Real Estate Appraisal and Evaluation Guidelines," October 13, 1992.

b. OCC: 12 CFR 34, subpart C; FRB: 12 CFR 208.18 and 12 CFR 225, subpart G; FDIC: 12 CFR 323; and OTS: 12 CFR 564.

c. OCC: 12 CFR 34, subpart D; FRB: 12 CFR 208, subpart C; FDIC: 12 CFR 365; and OTS: 12 CFR 545 and 563.

d. The appraisal guidance contained in the "Interagency Policy Statement on the Review and Classification of Commercial Real Estate Loans," November 7, 1991, generally applies to all transactions.

- establish selection criteria and procedures to evaluate and monitor the ongoing performance of individuals who perform appraisals or evaluations,
- provide for the independence of the person performing appraisals or evaluations,
- identify the appropriate appraisal for various lending transactions,
- establish criteria for contents of an evaluation,
- provide for the receipt of the appraisal or evaluation report in a timely manner to facilitate the underwriting decision,
- assess the validity of existing appraisals or evaluations to support subsequent transactions,
- establish criteria for obtaining appraisals or evaluations for transactions that are otherwise exempt from the agencies' appraisal regulations, and
- establish internal controls that promote compliance with these program standards.

Selection of Individuals Who May Perform Appraisals and Evaluations

An institution's program should establish criteria to select, evaluate, and monitor the performance of the individuals who perform a real estate appraisal or evaluation. The criteria should ensure that—

- the institution's selection process is nonpreferential and unbiased;
- the individual selected possesses the requisite education, expertise, and competence to complete the assignment;
- the individual selected is capable of rendering an unbiased opinion; and
- the individual selected is independent and has no direct or indirect interest, financial or otherwise, in the property or the transaction.

Under the agencies' appraisal regulations, the appraiser must be selected and engaged directly by the institution or its agent. The appraiser's client is the institution, not the borrower. An institution may use an appraisal that was prepared by an appraiser engaged directly by another financial services institution, as long as the institution determines that the appraisal conforms to the agencies' appraisal regulations and is otherwise acceptable.

Independence of the Appraisal and Evaluation Function

Because the appraisal and evaluation process is an integral component of the credit underwriting process, it should be isolated from influence by the institution's loan production process. An appraiser and an individual providing evaluation services should be independent of the loan and collection functions of the institution and have no interest, financial or otherwise, in the property or the transaction. If absolute lines of independence cannot be achieved, an institution must be able to clearly demonstrate that it has prudent safeguards to isolate its collateral evaluation process from influence or interference from the loan production process.

The agencies recognize, however, that it is not always possible or practical to separate the loan and collection functions from the appraisal or evaluation process. In some cases, such as in a small or rural institution or branch, the only individual qualified to analyze the real estate collateral may also be a loan officer, other officer, or director of the institution. To ensure their independence, such lending officials, officers, or directors should abstain from any vote or approval involving loans on which they performed an appraisal or evaluation.

Transactions That Require Appraisals

Although the agencies' appraisal regulations exempt certain categories of real estate–related financial transactions from the appraisal requirements, most real estate transactions over $250,000 are considered federally related transactions and thus require appraisals.[e] A "federally related transaction" means any real estate–related financial transaction in which the agencies engage, contract for, or regulate, and that requires the services of an appraiser. An agency also may impose more stringent appraisal requirements than the appraisal regulations require, such as when an institution's troubled condition is attributable to real estate loan underwriting problems.[f]

e. To facilitate recovery in designated major disaster areas, subject to safety-and-soundness considerations, section 2 of the Depository Institutions Disaster Relief Act of 1992 authorized the agencies to waive certain appraisal requirements for up to three years after a presidential declaration of a natural disaster.

f. As a matter of policy, OTS requires problem associations and associations in troubled condition to obtain appraisals for all real estate–related transactions over $100,000 (unless the transaction is otherwise exempt).

Minimum Appraisal Standards

The agencies' appraisal regulations include five minimum standards for the preparation of an appraisal. The appraisal must—

- conform to generally accepted appraisal standards as evidenced by the Uniform Standards of Professional Appraisal Practice (USPAP) promulgated by the Appraisal Standards Board (ASB) of the Appraisal Foundation unless principles of safe and sound banking require compliance with stricter standards;

  Although allowed by USPAP, the agencies' appraisal regulations do not permit an appraiser to appraise any property in which the appraiser has an interest, direct or indirect, financial or otherwise.

- be written and contain sufficient information and analysis to support the institution's decision to engage in the transaction;

  As discussed below, appraisers have available various appraisal development and report options; however, not all options may be appropriate for all transactions. A report option is acceptable under the agencies' appraisal regulations only if the appraisal report contains sufficient information and analysis to support an institution's decision to engage in the transaction.

- analyze and report appropriate deductions and discounts for proposed construction or renovation, partially leased buildings, nonmarket lease terms, and tract developments with unsold units;

  This standard is designed to avoid having appraisals prepared using unrealistic assumptions and inappropriate methods. For federally related transactions, an appraisal is to include the current market value of the property in its actual physical condition and subject to the zoning in effect as of the date of the appraisal. For properties where improvements are to be constructed or rehabilitated, the regulated institution may also request a prospective market value based on stabilized occupancy or a value based on the sum of retail sales. However, the sum of retail sales for a proposed development is not the market value of the development for the purpose of the agencies' appraisal regulations. For proposed developments that involve the sale of individual houses, units, or lots, the appraiser must analyze and report appropriate deductions and discounts for holding costs, marketing costs, and entrepreneurial profit. For proposed and rehabilitated rental developments, the appraiser must make appropriate deductions and discounts for items such as leasing commission, rent losses, and tenant improvements from an estimate based on stabilized occupancy.

- be based upon the definition of market value set forth in the regulation; and

  Each appraisal must contain an estimate of market value, as defined by the agencies' appraisal regulations.

- be performed by state-licensed or -certified appraisers in accordance with requirements set forth in the regulation.

Appraisal Options

An appraiser typically uses three market value approaches to analyze the value of a property—cost, income, and comparable sales—and reconciles the results of each to estimate market value. An appraisal will discuss the property's recent sales history and contain an opinion as to the highest and best use of the property. An appraiser must certify that he or she has complied with USPAP and is independent. Also, the appraiser must disclose whether the subject property was inspected and whether anyone provided significant assistance to the person signing the appraisal report.

An institution may engage an appraiser to perform either a Complete or Limited Appraisal.[g] When performing a Complete Appraisal assignment, an appraiser must comply with all USPAP standards without departing from any binding requirements and specific guidelines when estimating market value. When performing a Limited Appraisal, the appraiser elects to invoke the Departure Provision, which allows the appraiser to depart, under limited conditions, from standards identified as specific guidelines. For example, in a Limited Appraisal, the appraiser might not utilize all three approaches

g. USPAP Statement on Appraisal Standards No. 7 (SMT-7)—Permitted Departure from Specific Guidelines for Real Property Appraisal, issued March 30, 1994, effective July 1, 1994.

to value. Departure from standards designated as binding requirements is not permitted. An institution and appraiser must concur that use of the Departure Provision is appropriate for the transaction before the appraiser commences the appraisal assignment. The appraiser must ensure that the resulting appraisal report will not mislead the institution or other intended users of the appraisal report. The agencies do not prohibit the use of a Limited Appraisal for a federally related transaction, but the agencies believe that institutions should be cautious in their use of a Limited Appraisal because it will be less thorough than a Complete Appraisal.

Complete and Limited Appraisal assignments may be reported in three different report formats: a Self-Contained Report, a Summary Report, or a Restricted Report. The major difference among these three reports relates to the degree of detail presented in the report by the appraiser. The Self-Contained Appraisal Report provides the most detail, while the Summary Appraisal Report presents the information in a condensed manner. The Restricted Report provides a capsulized report with the supporting details maintained in the appraiser's files.

The agencies believe that the Restricted Report format will not be appropriate to underwrite a significant number of federally related transactions due to the lack of sufficient supporting information and analysis in the appraisal report. However, it might be appropriate to use this type of appraisal report for ongoing collateral monitoring of an institution's real estate transactions and under other circumstances when an institution's program requires an evaluation.

Moreover, since the institution is responsible for selecting the appropriate appraisal report to support its underwriting decisions, its program should identify the type of appraisal report that will be appropriate for various lending transactions. The institution's program should consider the risk, size, and complexity of the individual loan and the supporting collateral when determining the level of appraisal development and the type of report format that will be ordered. When ordering an appraisal report, institutions may want to consider the benefits of a written engagement letter that outlines the institution's expectations and delineates each party's responsibilities, especially for large, complex, or out-of-area properties.

Transactions That Require Evaluations

A formal opinion of market value prepared by a state-licensed or -certified appraiser is not always necessary. Instead, less formal evaluations of the real estate may suffice for transactions that are exempt from the agencies' appraisal requirements. The agencies' appraisal regulations allow an institution to use an appropriate evaluation of the real estate rather than an appraisal when the transaction—

- has a value of $250,000 or less;
- is a business loan of $1,000,000 or less, and the transaction is not dependent on the sale of, or rental income derived from, real estate as the primary source of repayment; or
- involves an existing extension of credit at the lending institution, provided that (i) there has been no obvious and material change in the market conditions or physical aspects of the property that threaten the adequacy of the institution's real estate collateral protection after the transaction, even with the advancement of new monies, or (ii) there is no advancement of new monies other than funds necessary to cover reasonable closing costs.

Institutions should also establish criteria for obtaining appraisals or evaluations for safety-and-soundness reasons for transactions that are otherwise exempt from the agencies' appraisal regulations.

Evaluation Content

An institution should establish prudent standards for the preparation of evaluations. At a minimum, an evaluation should—

- be written;
- include the preparer's name, address, and signature, and the effective date of the evaluation;
- describe the real estate collateral, its condition, its current and projected use;
- describe the source(s) of information used in the analysis;
- describe the analysis and supporting information; and
- provide an estimate of the real estate's market value, with any limiting conditions.

An evaluation report should include calculations, supporting assumptions, and, if utilized, a discussion of comparable sales. Documentation should be sufficient to allow an institution to understand the analysis, assumptions, and conclusions. An institution's own real estate loan portfolio experience and value estimates prepared for recent loans on comparable properties might provide a basis for evaluations.

An evaluation should provide an estimate of value to assist the institution in assessing the soundness of the transaction. Prudent practices also require that as an institution engages in more complex real estate–related financial transactions, or as its overall exposure increases, a more detailed evaluation should be performed. For example, an evaluation for a home equity loan might be based primarily on information derived from a sales data services organization or current tax assessment information, while an evaluation for an income-producing real estate property should fully describe the current and expected use of the property and include an analysis of the property's rental income and expenses.

Qualifications of Individuals Who Perform Evaluations

Individuals who prepare evaluations should have real estate–related training or experience and knowledge of the market relevant to the subject property. Based upon their experience and training, professionals from several fields may be qualified to prepare evaluations of certain types of real estate collateral. Examples include individuals with appraisal experience, real estate lenders, consultants or salespersons, agricultural extension agents, or foresters. Institutions should document the qualifications and experience level of individuals whom the institution deems acceptable to perform evaluations. An institution might also augment its in-house expertise and hire an outside party familiar with a certain market or a particular type of property. Although not required, an institution may use state-licensed or -certified appraisers to prepare evaluations. As such, Limited Appraisals reported in a Summary or Restricted format may be appropriate for evaluations of real estate–related financial transactions exempt from the agencies' appraisal requirements.

Valid Appraisals and Evaluations

The agencies allow an institution to use an existing appraisal or evaluation to support a subsequent transaction, if the institution documents that the existing estimate of value remains valid. Therefore, a prudent appraisal and evaluation program should include criteria to determine whether an existing appraisal or evaluation remains valid to support a subsequent transaction. Criteria for determining whether an existing appraisal or evaluation remains valid will vary depending upon the condition of the property and the marketplace, and the nature of any subsequent transaction. Factors that could cause changes to originally reported values include the passage of time; the volatility of the local market; the availability of financing; the inventory of competing properties; improvements to, or lack of maintenance of, the subject property or competing surrounding properties; changes in zoning; or environmental contamination. The institution must document the information sources and analyses used to conclude that an existing appraisal or evaluation remains valid for subsequent transactions.

Renewals, Refinancings, and Other Subsequent Transactions

While the agencies' appraisal regulations generally allow appropriate evaluations of real estate collateral in lieu of an appraisal for loan renewals and refinancings, in certain situations an appraisal is required. If new funds are advanced over reasonable closing costs, an institution would be expected to obtain a new appraisal for the renewal of an existing transaction when there is a material change in market conditions or the physical aspects of the property that threatens the institution's real estate collateral protection.

The decision to reappraise or reevaluate the real estate collateral should be guided by the exemption for renewals, refinancings, and other subsequent transactions. Loan workouts, debt restructurings, loan assumptions, and similar transactions involving the addition or substitution of borrowers may qualify for the exemption for renewals, refinancings, and other subsequent transactions. Use of this exemption depends on the condition and quality of the loan, the soundness of the underlying collateral, and the validity of the existing appraisal or evaluation.

A reappraisal would not be required when an institution advances funds to protect its interest in a property, such as to repair damaged property, because these funds should be used to restore the damaged property to its original condition. If a loan workout involves modification of the terms and conditions of an existing credit, including acceptance of new or additional real estate collateral, which facilitates the orderly collection of the credit or reduces the institution's risk of loss, a reappraisal or reevaluation may be prudent, even if it is obtained after the modification occurs.

An institution may engage in a subsequent transaction based on documented equity from a valid appraisal or evaluation, if the planned future use of the property is consistent with the use identified in the appraisal or evaluation. If a property, however, has reportedly appreciated because of a planned change in use of the property, such as rezoning, an appraisal would be required for a federally related transaction, unless another exemption applied.

Program Compliance

An institution's appraisal and evaluation program should establish effective internal controls that promote compliance with the program's standards. An individual familiar with the appropriate agency's appraisal regulation should ensure that the institution's appraisals and evaluations comply with the agencies' appraisal regulations, these guidelines, and the institution's program. Loan administration files should document this compliance review, although a detailed analysis or comprehensive analytical procedures are not required for every appraisal or evaluation. For some loans, the compliance review may be part of the loan officer's overall credit analysis and may take the form of either a narrative or a checklist. Corrective action should be undertaken for noted deficiencies by the individual who prepared the appraisal or evaluation.

An institution's appraisal and evaluation program should also have comprehensive analytical procedures that focus on certain types of loans, such as large-dollar credits, loans secured by complex or specialized properties, nonresidential real estate construction loans, or out-of-area real estate. These comprehensive analytical procedures should be designed to verify that the methods, assumptions, and conclusions are reasonable and appropriate for the transaction and the property. These procedures should provide for a more detailed review of selected appraisals and evaluations prior to the final credit decision. The individual(s) performing these reviews should have the appropriate training or experience, and be independent of the transaction.

Appraisers and persons performing evaluations should be responsible for any deficiencies in their reports. Deficient reports should be returned to them for correction. Unreliable appraisals or evaluations should be replaced prior to the final credit decision. Changes to an appraisal's estimate of value are permitted only as a result of a review conducted by an appropriately qualified state-licensed or -certified appraiser in accordance with Standard III of USPAP.

Portfolio Monitoring

The institution should also develop criteria for obtaining reappraisals or reevaluations as part of a program of prudent portfolio review and monitoring techniques—even when additional financing is not being contemplated. Examples of such types of situations include large credit exposures and out-of-area loans.

Referrals

Financial institutions are encouraged to make referrals directly to state appraiser regulatory authorities when a state-licensed or -certified appraiser violates USPAP or applicable state law, or engages in other unethical or unprofessional conduct. Examiners finding evidence of unethical or unprofessional conduct by appraisers will forward their findings and recommendations to their supervisory office for appropriate disposition and referral to the state, as necessary.

These guidelines are designed to in ensure that troubled real estate loans receive consistent treatment nationwide. The guidelines are not intended to be a substitute for the examiner's judgment or for careful analysis of applicable credit and collateral factors. Use of the word "institution" in these guidelines refers to any lending source within the bank holding company organization, whether the lender is the parent company, a bank, thrift, or nonbanking subsidiary.

2240.0.1 EXAMINER REVIEW OF COMMERCIAL REAL ESTATE LOANS

2240.0.1.1 Loan Policy and Administration Review

As part of the analysis of an institution's commercial real estate loan portfolio, examiners review lending policies, loan administration procedures, and credit risk control procedures. The maintenance of prudent written lending policies, effective internal systems and controls, and thorough loan documentation are essential to the institution's management of the lending function.

The policies governing an institution's real estate lending activities must include prudent underwriting standards that are periodically reviewed by the board of directors and clearly communicated to the institution's management and lending staff. The institution must also have credit risk control procedures that include, for example, prudent internal limits on exposure, an effective credit review and classification process, and a methodology for ensuring that the allowance for loan and lease losses is maintained at an adequate level. The complexity and scope of these policies and procedures should be appropriate to the size of the institution and the nature of the institution's activities, and should be consistent with prudent banking practices and relevant regulatory requirements.

2240.0.1.2 Indicators of Troubled Real Estate Markets and Projects, and Related Indebtedness

In order to evaluate the collectibility of an institution's commercial real estate portfolio, examiners should be alert for indicators of weakness in the real estate markets served by the institution. They should also be alert for indicators of actual or potential problems in the individual commercial real estate projects or transactions financed by the institution.

There are several warning signs that real estate markets or projects are experiencing problems that may result in real estate values decreasing from original appraisals or projections. Adverse economic developments and/or an overbuilt market can affect a project's economic feasibility and may cause a real estate project and the loan to become troubled. Available indicators, such as permits for—and the value of—new construction, absorption rates, employment trends, and vacancy rates, are useful in evaluating the condition of commercial real estate markets. Weaknesses disclosed by these types of statistics may indicate that a real estate market is experiencing difficulties that may result in cash flow problems for individual real estate projects, declining real estate values, and ultimately, in troubled commercial real estate loans.

Indicators of potential or actual difficulties in commercial real estate projects may include:

- An excess of similar projects under construction.
- Construction delays or other unplanned adverse events resulting in cost overruns that may require renegotiation of loan terms.
- Lack of a sound feasibility study or analysis that reflects current and reasonably anticipated market conditions.
- Changes in concept or plan (for example, a condominium project converted to an apartment project because of unfavorable market conditions).
- Rent concessions or sales discounts resulting in cash flow below the level projected in the original feasibility study or appraisal.
- Concessions on finishing tenant space, moving expenses, and lease buyouts.
- Slow leasing or lack of sustained sales activity and increasing sales cancellations that may reduce the project's income potential, resulting in protracted repayment or default on the loan.
- Delinquent lease payments from major tenants.
- Land values that assume future rezoning.
- Tax arrearages.

As the problems associated with a commercial real estate project become more pronounced, problems with the related indebtedness may also arise. Such problems include diminished cash flow to service the debt and delinquent interest and principal payments.

While some commercial real estate loans become troubled because of a general downturn in the market, others become troubled because they were originated on an unsound or a liberal basis. Common examples of these types of problems include:

- Loans with no or minimal borrower equity.
- Loans on speculative undeveloped property where the borrowers' only source of repayment is the sale of the property.
- Loans based on land values that have been driven up by rapid turnover of ownership, but without any corresponding improvements to the property or supportable income projections to justify an increase in value.
- Additional advances to service an existing loan that lacks credible support for full repayment from reliable sources.
- Loans to borrowers with no development plans or noncurrent development plans.
- Renewals, extensions and refinancings that lack credible support for full repayment from reliable sources and that do not have a reasonable repayment schedule.[1]

2240.0.1.3 Examiner Review of Individual Loans, Including the Analysis of Collateral Value

The focus of an examiner's review of a commercial real estate loan, including binding commitments, is the ability of the loan to be repaid. The principal factors that bear on this analysis are the income-producing potential of the underlying collateral and the borrower's willingness and capacity to repay under the existing loan terms from the borrower's other resources if necessary. In evaluating the overall risk associated with a commercial real estate loan, examiners consider a number of factors, including the character, overall financial condition and resources, and payment record of the borrower; the prospects for support from any financially responsible guarantors; and the nature and degree of protection provided by the cash flow and value of the underlying collateral.[2] However, as other sources of repayment for a troubled commercial real estate loan become inadequate over time, the importance of the collateral's value in the analysis of the loan necessarily increases.

The appraisal regulations of the federal bank and thrift regulatory agencies require institutions to obtain appraisals when certain criteria are met.[3] Management is responsible for reviewing each appraisal's assumptions and conclusions for reasonableness. Appraisal assumptions should not be based solely on current conditions that ignore the stabilized income-producing capacity of the property.[4] Management should adjust any assumptions used by an appraiser in determining value that are overly optimistic or pessimistic.

An examiner analyzes the collateral's value as determined by the institution's most recent appraisal (or internal evaluation, as applicable). An examiner reviews the major facts, assumptions, and approaches used by the appraiser (including any comments made by management on the value rendered by the appraiser). Under the circumstances described below, the examiner may make adjustments to this assessment of value. This review and any resulting adjustments to value are solely for purposes of an examiner's analysis and classification of a credit and do not involve actual adjustments to an appraisal.

A discounted cash flow analysis is an appropriate method for estimating the value of income-producing real estate collateral.[5] This analysis should not be based solely on the current performance of the collateral or similar

1. As discussed more fully in Manual section 2240.0.2, the refinancing or renewing of loans to sound borrowers would not result in a supervisory classification or criticism unless well-defined weaknesses exist that jeopardize repayment of the loans. Consistent with sound banking practices, institutions should work in an appropriate and constructive manner with borrowers who may be experiencing temporary difficulties.

2. The treatment of guarantees in the classification process is discussed in subsection 2240.0.3.

3. Department of the Treasury, Office of the Comptroller of the Currency, 12 CFR Part 34 (Docket No. 90–16); Board of Governors of the Federal Reserve System, 12 CFR Parts 208 and 225 (Regulation H and Y; Docket No. R–0685); Federal Deposit Insurance Corporation, 12 CFR 323 (RIN 3064–AB05); Department of the Treasury; Office of Thrift Supervision, 12 CFR Part 564 (Docket No. 90–1495).

4. Stabilized income generally is defined as the yearly net operating income produced by the property at normal occupancy and rental rates; it may be adjusted upward or downward from today's actual market conditions.

5. The real estate appraisal regulations of the federal bank and thrift regulatory agencies include a requirement that an appraisal (a) follow a reasonable valuation method that addresses the direct sales comparison, income, and cost approaches to market value; (b) reconcile these approaches; and (c) explain the elimination of each approach not used. A discounted cash flow analysis is recognized as a valuation method for the income approach.

properties; rather, it should take into account, on a discounted basis, the ability of the real estate to generate income over time based upon reasonable and supportable assumptions.

When reviewing the reasonableness of the facts and assumptions associated with the value of the collateral, examiners may evaluate:

- Current and projected vacancy and absorption rates;
- Lease renewal trends and anticipated rents;
- Volume and trends in past due leases;
- Effective rental rates or sale prices (taking into account all concessions);
- Net operating income of the property as compared with budget projections; and
- Discount rates and direct capitalization (“cap”) rates.

The capacity of a property to generate cash flow to service a loan is evaluated based upon rents (or sales), expenses, and rates of occupancy that are reasonably estimated to be achieved over time. The determination of the level of stabilized occupancy and rental rates should be based upon an analysis of current and reasonably expected market conditions, taking into consideration historical levels when appropriate. The analysis of collateral values should not be based upon a simple projection of current levels of net operating income if markets are depressed or reflect speculative pressures but can be expected over a reasonable period of time to return to normal (stabilized) conditions. Judgment is involved in determining the time that it will take for a property to achieve stabilized occupancy and rental rates.

Examiners do not make adjustments to appraisal assumptions for credit analysis purposes based on worst case scenarios that are unlikely to occur. For example, an examiner would not necessarily assume that a building will become vacant just because an existing tenant who is renting at a rate above today’s market rate may vacate the property when the current lease expires. On the other hand, an adjustment to value may be appropriate for credit analysis purposes when the valuation assumes renewal at the above-market rate, unless that rate is a reasonable estimate of the expected market rate at the time of renewal.

When estimating the value of income-producing real estate, discount rates and “cap” rates should reflect reasonable expectations about the rate of return that investors require under normal, orderly and sustainable market conditions. Exaggerated, imprudent, or unsustainably high or low discount rates, “cap” rates, and income projections should not be used. Direct capitalization of nonstabilized income flows should also not be used.

Assumptions, when recently made by qualified appraisers (and, as appropriate, by institution management) and when consistent with the discussion above, should be given a reasonable amount of deference. Examiners should not challenge the underlying assumptions, including discount rates and “cap” rates used in appraisals, that differ only in a limited way from norms that would generally be associated with the property under review. The estimated value of the underlying collateral may be adjusted for credit analysis purposes when the examiner can establish that any underlying facts or assumptions are inappropriate and can support alternative assumptions.

2240.0.2 CLASSIFICATION GUIDELINES

As with other types of loans, commercial real estate loans that are adequately protected by the current sound worth and debt service capacity of the borrower, guarantor, or the underlying collateral generally are not classified. Similarly, loans to sound borrowers that are refinanced or renewed in accordance with prudent underwriting standards, including loans to creditworthy commercial or residential real estate developers, should not be classified or criticized unless well-defined weaknesses exist that jeopardize repayment. An institution will not be criticized for continuing to carry loans having weaknesses that result in classification or criticism as long as the institution has a well-conceived and effective workout plan for such borrowers, and effective internal controls to manage the level of these loans.

In evaluating commercial real estate credits for possible classification, examiners apply standard classification definitions. In determining the appropriate classification, consideration should be given to all important information on repayment prospects, including information on the borrower’s creditworthiness, the value of, and cash flow provided by, all collateral supporting the loan, and any support provided by financially responsible guarantors.

The loan’s record of performance to date is important and must be taken into consideration. As a general principle, a performing commercial real estate loan should not automatically be classified or charged-off solely because the value of the underlying collateral has declined to an amount that is less than the loan balance. However, it would be appropriate to classify a performing loan when well-defined weaknesses exist that jeopardize repayment, such as the lack of credible support for full repayment from reliable sources.

These principles hold for individual credits, even if portions or segments of the industry to which the borrower belongs are experiencing financial difficulties. The evaluation of each credit should be based upon the fundamental characteristics affecting the collectibility of the particular credit. The problems broadly associated with some sectors or segments of an industry, such as certain commercial real estate markets, should not lead to overly pessimistic assessments of particular credits that are not affected by the problems of the troubled sectors.

2240.0.2.1 Classification of Troubled Project-Dependent Commercial Real Estate Loans[6]

The following guidelines for classifying a troubled commercial real estate loan apply when the repayment of the debt will be provided solely by the underlying real estate collateral, and there are no other available and reliable sources of repayment. The guidelines are not intended to address loans that must be treated as ''Other Real Estate Owned'' for bank and BHC reporting purposes.

As a general principle, for a troubled project-dependent commercial real estate loan, any portion of the loan balance that exceeds the amount that is adequately secured by the value of the collateral, and that can clearly be identified as uncollectible, should be classified ''loss.''[7] The portion of the loan balance that is adequately secured by the value of the collateral should generally be classified no worse than ''substandard.'' The amount of the loan balance in excess of the value of the collateral, or portions thereof, should be classified ''doubtful'' when the potential for full loss may be mitigated by the outcomes of certain pending events, or when loss is expected but the amount of the loss cannot be reasonably determined.

If warranted by the underlying circumstances, an examiner may use a ''doubtful'' classification on the entire loan balance. However, this would occur infrequently.

2240.0.2.2 Guidelines for Classifying Partially Charged-off Loans

Based upon consideration of all relevant factors, an evaluation may indicate that a credit has well-defined weaknesses that jeopardize collection in full, but that a portion of the loan may be reasonably assured of collection. When an institution has taken a charge-off in an amount sufficient that the remaining recorded balance of the loan (a) is being serviced (based upon reliable sources) and (b) is reasonably assured of collection, classification of the remaining recorded balance may not be appropriate. Classification would be appropriate when well-defined weaknesses continue to be present in the remaining recorded balance. In such cases, the remaining recorded balance would generally be classified no more severely than ''substandard.''

A more severe classification than ''substandard'' for the remaining recorded balance would be appropriate if the loss exposure cannot be reasonably determined, e.g., where significant risk exposures are perceived, such as might be the case for bankruptcy situations or for loans collateralized by properties subject to environmental hazards. In addition, classification of the remaining recorded balance would be appropriate when sources of repayment are considered unreliable.

2240.0.2.3 Guidelines for Classifying Formally Restructured Loans

The classification treatment previously discussed for a partially charged off loan would also generally be appropriate for a formally restructured loan when partial charge-offs have been taken. For a formally restructured loan, the focus of the examiner's analysis is on the ability of the borrower to repay the loan in accordance with its modified terms. Classification of a formally restructured loan would be appropriate, if, after the restructuring, well-defined weaknesses exist that jeopardize the orderly repayment of the loan in accordance with reasonable modified

6. The discussion in this section is not intended to address loans that must be treated as ''other real estate owned'' for bank regulatory reporting purposes or ''real estate owned'' for thrift regulatory reporting purposes. Guidance on these assets is presented in supervisory and reporting guidance of the agencies.

7. For purposes of this discussion, the ''value of the collateral'' is the value used by the examiner for credit analysis purposes, as discussed in a previous section of this policy statement.

terms.[8] Troubled commercial real estate loans whose terms have been restructured should be identified in the institution's internal credit review system, and closely monitored by management.

2240.0.3 TREATMENT OF GUARANTEES IN THE CLASSIFICATION PROCESS

Initially, the original source of repayment and the borrower's intent and ability to fulfill the obligation without reliance on third party guarantors will be the primary basis for the review and classification of assets.[9] The federal bank and thrift regulatory agencies will, however, consider the support provided by guarantees in the determination of the appropriate classification treatment for troubled loans. The presence of a guarantee from a ''financially responsible guarantor,'' as described below, may be sufficient to preclude classification or reduce the severity of classification.

For purposes of this discussion, a guarantee from a ''financially responsible guarantor'' has the following attributes:

- The guarantor must have both the financial capacity and willingness to provide support for the credit;
- The nature of the guarantee is such that it can provide support for repayment of the indebtedness, in whole or in part, during the remaining loan term; and[10]
- The guarantee should be legally enforceable.

The above characteristics generally indicate that a guarantee may improve the prospects for repayment of the debt obligation.

2240.0.3.1 Considerations Relating to a Guarantor's Financial Capacity

The lending institution must have sufficient information on the guarantor's financial condition, income, liquidity, cash flow, contingent liabilities, and other relevant factors (including credit ratings, when available) to demonstrate the guarantor's financial capacity to fulfill the obligation. Also, it is important to consider the number and amount of guarantees currently extended by a guarantor, in order to determine that the guarantor has the financial capacity to fulfill the contingent claims that exist.

2240.0.3.2 Considerations Relating to a Guarantor's Willingness to Repay

Examiners normally rely on their analysis of the guarantor's financial strength and assume a willingness to perform unless there is evidence to the contrary. This assumption may be modified based on the ''track record'' of the guarantor, including payments made to date on the asset under review or other obligations.

Examiners give due consideration to those guarantors that have demonstrated their ability and willingness to fulfill previous obligations in their evaluation of current guarantees on similar assets. An important consideration will be whether previously required performance under guarantees was voluntary or the result of legal or other actions by the lender to enforce the guarantee. However, examiners give limited credence, if any, to guarantees from obligors who have reneged on obligations in the past, unless there is clear evidence that the guarantor has the ability and intent to honor the specific guarantee obligation under review.

Examiners also consider the economic incentives for performance from guarantors:

- Who have already partially performed under the guarantee or who have other significant investments in the project;
- Whose other sound projects are cross-collateralized or otherwise intertwined with the credit; or
- Where the guarantees are collateralized by readily marketable assets that are under the control of a third party.

2240.0.3.3 Other Considerations as to the Treatment of Guarantees in the Classification Process

In general, only guarantees that are legally

8. An example of a restructured commercial real estate loan that does *not* have reasonable modified terms would be a ''cash flow'' mortgage which requires interest payments *only* when the underlying collateral generates cash flow but provides no substantive benefits to the lending institution.

9. Some loans are originated based primarily upon the financial strength of the guarantor, who is, in substance, the primary source of repayment. In such circumstances, examiners generally assess the collectibility of the loan based upon the guarantor's ability to repay the loan.

10. Some guarantees may only provide for support for certain phases of a real estate project. It would not be appropriate to rely upon these guarantees to support a troubled loan after the completion of these phases.

enforceable will be relied upon. However, all legally enforceable guarantees may not be acceptable. In addition to the guarantor's financial capacity and willingness to perform, it is expected that the guarantee will not be subject to significant delays in collection, or undue complexities or uncertainties about the guarantee.

The nature of the guarantee is also considered by examiners. For example, some guarantees for real estate projects only pertain to the development and construction phases of the project. As such, these limited guarantees would not be relied upon to support a troubled loan after the completion of those phases.

Examiners also consider the institution's intent to enforce the guarantee and whether there are valid reasons to preclude an institution from pursuing the guarantee. A history of timely enforcement and successful collection of the full amount of guarantees will be a positive consideration in the classification process.

During the early 1980s, open-end credit primarily consisted of credit card accounts with small lines of credit to the most creditworthy borrowers. Currently, open-end credit consists of much larger lines of credit that have been extended to diverse borrowers with a variety of risk profiles. In 1980, the Federal Financial Institutions Examination Council (FFIEC) (the Federal Reserve Board, Federal Deposit Insurance Corporation, Office of the Comptroller of the Currency, and, in 1987, the Federal Home Loan Bank Board (now the Office of Thrift Supervision)) adopted a uniform policy for the classification of installment credit based on delinquency status. The 1980 policy also provided for different charge-off time frames for open-end and closed-end credit.

Because open-ended borrowing practices had changed and institutional practices for charging off open-end accounts based on their past-due status were inconsistent, the agencies (the FRB, FDIC, OTS, and OCC) undertook a review of the 1980 FFIEC classification policy in concert with a review of all written policies, as mandated by section 303(a) of the Riegle Community Development and Regulatory Improvement Act of 1994 (RCDRIA). In February 1999, an updated policy was issued, effective for use on FFIEC bank call reports beginning December 31, 2000. This new policy was revised again and reissued in June 2000, with the same effective date. (The June 2000 policy supersedes both the 1980 policy and the updated February 1999 policy.) The June policy provides supervisory guidance for residential and home equity loans; fraudulent loans; loans to deceased persons; loans to borrowers in bankruptcy; treatment of partial payments involving past-due loans; and re-aging, deferrals, renewals, or rewrites of open-end and closed-end credit. The agencies are to use this expanded supervisory guidance when applying the uniform classifications to retail-credit loans extended by depository institutions. See SR-00-8.

While the terms of the revised policy apply only to federally insured depository institutions, the Federal Reserve believes the guidance is broadly applicable to bank holding companies (BHCs) and their nonbank lending subsidiaries. Accordingly, examiners should apply the revised policy, as appropriate, in the inspection of consumer finance subsidiaries of BHCs.

When reviewing consumer finance subsidiaries of banking organizations, examiners should consider the methodology used for aging retail loans. In accordance with the FFIEC bank call report instructions, banks and their consumer finance subsidiaries are required to use the contractual method, which ages loans based on the status of contractual payments. BHCs, in preparing their financial statements, are permitted to use the range of options available under GAAP. This, in effect, allows uninsured, nonbank consumer finance subsidiaries of BHCs to employ the recency method, which ages loans according to the date of the most recent payment, regardless of the contractual terms of the loan.

In general, the contractual method provides a more accurate reflection of loan performance and, therefore, is the *preferred* methodology, especially from the standpoint of financial-statement transparency and public disclosure. Examiners should encourage BHCs and their consumer finance subsidiaries to use the contractual method. However, BHCs should not change their aging methodology from contractual to recency without the prior concurrence of the Federal Reserve. A BHC subsidiary may not change its methodology if the intent or effect of such a change is to mask asset quality or financial weaknesses. Moreover, in the event that consumer receivables are transferred from a bank to its BHC or the BHC's nonbanking subsidiaries, the BHC or the nonbanking subsidiaries should continue to age the receivables according to the contractual method.

When a BHC uses the recency method, it should have adequate controls in place to accurately track the performance of loans within the retail portfolio and to demonstrate sound and compelling business reasons for the use of the recency method. Examiners should see section 3100.0 for further guidance on the review of consumer finance operations.

2241.0.1 UNIFORM RETAIL-CREDIT CLASSIFICATION AND ACCOUNT-MANAGEMENT POLICY

The uniform retail-credit classification and account-management policy issued by the FFIEC (and approved by the Federal Reserve Board) is reproduced below. The Board has clarified certain provisions of this policy. In this text, the Board's revisions are in brackets. Section numbers have also been added to the subtitles of the text.

The Uniform Retail-Credit Classification and Account-Management Policy[1] establishes standards for the classification and treatment of retail credit in financial institutions. Retail credit consists of open- and closed-end credit extended to individuals for household, family, and other personal expenditures, and includes consumer loans and credit cards. For purposes of this policy, retail credit also includes loans to individuals secured by their personal residence, including first mortgage, home equity, and home-improvement loans. Because a retail-credit portfolio generally consists of a large number of relatively small-balance loans, evaluating the quality of the retail-credit portfolio on a loan-by-loan basis is inefficient and burdensome for the institution being examined and for examiners.

Actual credit losses on individual retail credits should be recorded when the institution becomes aware of the loss, but in no case should the charge-off exceed the time frames stated in this policy. This policy does not preclude an institution from adopting a more conservative internal policy. Based on collection experience, when a portfolio's history reflects high losses and low recoveries, more conservative standards are appropriate and necessary.

The quality of retail credit is best indicated by the repayment performance of individual borrowers. Therefore, in general, retail credit should be classified based on the following criteria:

1. Open- and closed-end retail loans past due 90 cumulative days from the contractual due date should be classified substandard.
2. Closed-end retail loans that become past due 120 cumulative days and open-end retail loans that become past due 180 cumulative days from the contractual due date should be classified loss and charged off.[2] In lieu of charging off the entire loan balance, loans with non–real estate collateral may be written down to the value of the collateral, less cost to sell, if repossession of collateral is assured and in process.
3. One- to four-family residential real estate loans and home equity loans that are past due 90 days or more with loan-to-value ratios greater than 60 percent should be classified substandard. Properly secured residential real estate loans with loan-to-value ratios equal to or less than 60 percent are generally not classified based solely on delinquency status. Home equity loans to the same borrower at the same institution as the senior mortgage loan with a combined loan-to-value ratio equal to or less than 60 percent need not be classified. However, home equity loans where the institution does not hold the senior mortgage, that are past due 90 days or more should be classified substandard, even if the loan-to-value ratio is equal to, or less than, 60 percent.

   For open- and closed-end loans secured by residential real estate, a current assessment of value should be made no later than 180 days past due. Any outstanding loan balance in excess of the value of the property, less cost to sell, should be classified loss and charged off.
4. Loans in bankruptcy should be classified loss and charged off within 60 days of receipt of notification of filing from the bankruptcy court or within the time frames specified in this classification policy, whichever is shorter, unless the institution can clearly demonstrate and document that repayment is likely to occur. Loans with collateral may be written down to the value of the collateral, less cost to sell. Any loan balance not charged off should be classified substandard until the borrower re-establishes the ability and willingness to repay for a period of at least six months.
5. Fraudulent loans should be classified loss and charged off no later than 90 days of discovery or within the time frames adopted in this classification policy, whichever is shorter.
6. Loans of deceased persons should be classified loss and charged off when the loss is determined or within the time frames adopted in this classification policy, whichever is shorter.

1. [For the Federal Reserve's depository institution classification guidelines, see section 2060.1, "Classification of Credits," in the *Commercial Bank Examination Manual.]*

2. For operational purposes, whenever a charge-off is necessary under this policy, it should be taken no later than the end of the month in which the applicable time period elapses. Any full payment received after the 120- or 180-day charge-off threshold, but before month-end charge-off, may be considered in determining whether the charge-off remains appropriate.

OTS regulation 12 CFR 560.160(b) allows savings institutions to establish adequate (specific) valuation allowances for assets classified loss in lieu of charge-offs.

Open-end retail accounts that are placed on a fixed repayment schedule should follow the charge-off time frame for closed-end loans.

2241.0.1.1 Other Considerations for Classification

If an institution can clearly document that a past-due loan is well secured and in the process of collection, such that collection will occur regardless of delinquency status, then the loan need not be classified. A well-secured loan is collateralized by a perfected security interest in, or pledges of, real or personal property, including securities with an estimable value, less cost to sell, sufficient to recover the recorded investment in the loan, as well as a reasonable return on that amount. ''In the process of collection'' means that either a collection effort or legal action is proceeding and is reasonably expected to result in recovery of the loan balance or its restoration to a current status, generally within the next 90 days.

2241.0.1.2 Partial Payments on Open- and Closed-End Credit

Institutions should use one of two methods to recognize partial payments. A payment equivalent to 90 percent or more of the contractual payment may be considered a full payment in computing past-due status. Alternatively, the institution may aggregate payments and give credit for any partial payment received. For example, if a regular installment payment is $300 and the borrower makes payments of only $150 per month for a six-month period, [the institution could aggregate the payments received ($150 × six payments, or $900). It could then give credit for three full months ($300 x three payments) and thus treat the loan as] three full months past due. An institution may use either or both methods in its portfolio, but may not use both methods simultaneously with a single loan.

2241.0.1.3 Re-aging, Extensions, Deferrals, Renewals, and Rewrites

Re-aging of open-end accounts, and extensions, deferrals, renewals, and rewrites of closed-end loans[3] can be used to help borrowers overcome temporary financial difficulties, such as loss of job, medical emergency, or change in family circumstances like loss of a family member. A permissive policy on re-agings, extensions, deferrals, renewals, or rewrites can cloud the true performance and delinquency status of the portfolio. However, prudent use is acceptable when it is based on a renewed willingness and ability to repay the loan, and when it is structured and controlled in accordance with sound internal policies.

Management should ensure that comprehensive and effective risk management and internal controls are established and maintained so that re-ages, extensions, deferrals, renewals, and rewrites can be adequately controlled and monitored by management and verified by examiners. The decision to re-age, extend, defer, renew, or rewrite a loan, like any other modification of contractual terms, should be supported in the institution's management information systems. Adequate management information systems usually identify and document any loan that is re-aged, extended, deferred, renewed, or rewritten, including the number of times such action has been taken. Documentation normally shows that the institution's personnel communicated with the borrower, the borrower agreed to pay the loan in full, and the borrower has the ability to repay the loan. To be effective, management information systems should also monitor and track the volume and performance of loans that have been re-aged, extended, deferred, renewed, or rewritten and/or placed in a workout program.

2241.0.1.4 Open-End Accounts

Institutions that re-age open-end accounts should establish a reasonable written policy and adhere to it. To be considered for re-aging, an account should exhibit the following:

1. The borrower has demonstrated a renewed willingness and ability to repay the loan.

3. These terms are defined as follows. *Re-age:* Returning a delinquent, open-end account to current status without collecting (at the time of aging) the total amount of principal, interest, and fees that are contractually due. *Extension:* Extending monthly payments on a closed-end loan and rolling back the maturity by the number of months extended. The account is shown current upon granting the extension. If extension fees are assessed, they should be collected at the time of the extension and not added to the balance of the loan. *Deferral:* Deferring a contractually due payment on a closed-end loan without affecting the other terms, including maturity, (or the due date for subsequently scheduled payments,) of the loan. The account is shown current upon granting the deferral. *Renewal:* Underwriting a matured, closed-end loan generally at its outstanding principal amount and on similar terms. *Rewrite:* Underwriting an existing loan by significantly changing its terms, including payment amounts, interest rates, amortization schedules, or its final maturity.

2. The account has existed for at least nine months.
3. The borrower has made at least three consecutive minimum monthly payments or the equivalent cumulative amount. Funds may not be advanced by the institution for this purpose.

Open-end accounts should not be re-aged more than once within any twelve-month period and no more than twice within any five-year period. Institutions may adopt a more conservative re-aging standard; for example, some institutions allow only one re-aging in the lifetime of an open-end account. Additionally, an over-limit account may be re-aged at its outstanding balance (including the over-limit balance, interest, and fees), provided that no new credit is extended to the borrower until the balance falls below the predelinquency credit limit.

Institutions may re-age an account after it enters a workout program, including internal and third-party debt-counseling services, but only after receipt of at least three consecutive minimum monthly payments or the equivalent cumulative amount, as agreed upon under the workout or debt-management program. Re-aging for workout purposes is limited to once in a five-year period and is in addition to the once-in-twelve-months/twice-in-five-years limitation described above. To be effective, management information systems should track the principal reductions and charge-off history of loans in workout programs by type of program.

2241.0.1.5 Closed-End Loans

Institutions should adopt and adhere to explicit standards that control the use of extensions, deferrals, renewals, and rewrites of closed-end loans. The standards should exhibit the following:

1. The borrower should show a renewed willingness and ability to repay the loan.
2. The standards should limit the number and frequency of extensions, deferrals, renewals, and rewrites.
3. Additional advances to finance unpaid interest and fees should be prohibited.

Management should ensure that comprehensive and effective risk management, reporting, and internal controls are established and maintained to support the collection process and to ensure timely recognition of losses. To be effective, management information systems should track the subsequent principal reductions and charge-off history of loans that have been granted an extension, deferral, renewal, or rewrite.

2241.0.1.6 Examination Considerations

Examiners should ensure that institutions adhere to this policy. Nevertheless, there may be instances that warrant exceptions to the general classification policy. Loans need not be classified if the institution can document clearly that repayment will occur irrespective of delinquency status. Examples might include loans well secured by marketable collateral and in the process of collection, loans for which claims are filed against solvent estates, and loans supported by valid insurance claims.

The Uniform Retail-Credit Classification and Account-Management Policy does not preclude examiners from classifying individual retail-credit loans that exhibit signs of credit weakness regardless of delinquency status. Similarly, an examiner may also classify retail portfolios, or segments thereof, where underwriting standards are weak and present unreasonable credit risk, and may criticize account-management practices that are deficient.

In addition to reviewing loan classifications, the examiner should ensure that the institution's allowance for loan and lease losses provides adequate coverage for probable losses inherent in the portfolio. Sound risk- and account-management systems, including a prudent retail-credit lending policy, measures to ensure and monitor adherence to stated policy, and detailed operating procedures, should also be implemented. Internal controls should be in place to ensure that the policy is followed. Institutions that lack sound policies or fail to implement or effectively adhere to established policies will be subject to criticism.

Issued by the Federal Financial Institutions Examination Council on June 6, 2000.

In carrying out its regulatory and supervisory responsibilities, the Board requires the submission of various reports from bank holding companies. These reports are an integral part of the Board's supervision, monitoring, and surveillance functions. Information from these reports is used to evaluate the performance of bank holding companies, appraise their financial condition, and determine their compliance with applicable laws and regulations. The examiner must review the reports (submitted to the Federal Reserve System) for accuracy and timeliness and insist on their being amended if material errors are found. If inaccurate data are submitted, the resulting ratios could conceal deteriorating trends in the company's financial condition and performance. Bank holding companies should maintain sufficient internal systems and procedures to ensure that reporting is accomplished according to appropriate regulatory requirements. Clear, concise, and orderly workpapers should support the data presented and provide a logical tie between report data and the financial records. For detailed current information on who must submit reports and what the reporting requirements are, see the Board's public site on the Internet at the following address: www.federalreserve.gov/boarddocs/reportforms.

2250.0.1 PENALTIES FOR ERRORS IN REPORTS

Section 8 of the Bank Holding Company Act (the act) was amended to provide for the assessment of civil money penalties for the submission of late, false, or misleading reports filed by bank holding companies that are required by the act and Regulation Y and for the failure to file the required regulatory reports. Financial institutions that have adequate procedures to avoid any inadvertent errors but that unintentionally submit incorrect information or are minimally late in publishing or transmitting the reports can be fined up to $2,000 per day. The financial institution has the burden of proving that the error was inadvertent. If the error was not inadvertent, a penalty of up to $20,000 per day can be assessed. If the submission was done in a knowing manner or with reckless disregard for the law, a fine of up to $1 million or 1 percent of the institution's assets can be assessed for each day of the violation. Institution-affiliated parties who participate in any manner in the filing of an institution's false or misleading required regulatory report, or who cause the failure to file or a late filing of a required regulatory report, may be assessed a civil money penalty of up to $25,000 per day.

2250.0.2 APPROVAL OF DIRECTORS AND SENIOR OFFICERS OF DEPOSITORY INSTITUTIONS

The Federal Deposit Insurance Act (12 U.S.C. 1811) was amended to require each insured depository institution and depository institution holding company to give 30 days' prior notification to the federal banking authority of (1) the proposed addition of any individual to its board of directors or (2) the employment of any individual as a senior executive officer. This requirement applies to the following institutions:

1. institutions that have been chartered less than two years
2. institutions that have undergone a change in control within the preceding two years
3. institutions that are in a troubled condition or whose capital is below minimum standards

The agencies have the authority to issue a notice of disapproval to stop the appointment or employment of an individual if they feel that appointing or employing the person would not be in the interests of the public, taking into account that individual's competence, experience, character, and integrity.

2250.0.3 INSPECTION OBJECTIVES

1. To determine that required reports are being filed on time.
2. To determine that the contents of reports are accurate and complete.
3. To recommend corrective and, if needed, formal enforcement action when official reporting practices, policies, or procedures are deficient.

2250.0.4 INSPECTION PROCEDURES

1. A bank holding company's historical record concerning the timely submission of reports should be ascertained by reviewing relevant

Reserve Bank files. The examiner should determine, from documentation in the files, which reports should have been filed because of the passage of time or the occurrence of an event. If a report is delinquent, the bank holding company should be instructed to prepare and submit the report expeditiously.

2. Copies of regulatory reports filed since the prior inspection should be reviewed and compared with company records on a random, line-by-line basis, using a significance test. In some cases, the review will necessarily extend to supporting schedules and workpapers that substantiate the data reflected in the reports. If the initial reports reviewed are found to be substantially correct, then the scope of subsequent reviews may be curtailed. If the reports are found to be incorrect, the overall review procedures should be intensified. When an error or misstatement is considered significant, the matter should be brought to management's attention and the bank holding company should be required to submit adjusted data. Improper methods used in preparing reports should be called to management's attention. The examiner should explain all changes carefully and assist bank holding company personnel in whatever way possible to ensure proper reporting in future reports.
3. At the conclusion of the review process, the examiner should discuss the following with management, when applicable:
   a. inaccuracies found in reports and the need for submission of amended pages or reports
   b. violations of law, rulings, or regulations
   c. recommended corrective action when policies or procedures have contributed to deficiencies noted in the reports or the untimely submission of report(s)
4. Details concerning the late or inaccurate preparation of reports should be listed in the inspection report on the Other Supervisory Issues report page. If the matter is considered significant, it should be noted on the Examiner's Comments and Matters Requiring Special Board Attention report page, as well. When the exceptions are considered minor and have been discussed with management and corrected, it will suffice to state this on the Other Supervisory Issues workpaper supporting page.
5. When it is determined that false, misleading, or inaccurate information is contained in financial statements or reports, consider whether formal enforcement action is needed to ensure that the offending bank holding company, financial institution, or other entity under the holding company structure will correct the statements and reports.

2250.0.5 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

2260.0.1 INTRODUCTION

Venture capital activities are usually conducted through one or more of the following types of entities: Small Business Investment Companies (SBIC); Minority Enterprise Small Business Investment Companies (MESBIC); Non-licensed Venture Capital Companies; and Partnerships or Venture Capital Funds. SBIC's and MESBIC's are licensed and regulated by the Small Business Administration (SBA); the other types are not. Both SBIC's and MESBIC's are limited by regulation to investing in and lending to small businesses; whereas, non-licensed venture capital companies and partnerships have greater latitude. The activities of MESBIC's (section 103d companies) are specifically limited to small firms owned by socially or economically disadvantaged persons. Most banks and bank holding companies engage in venture capital activities through an SBIC because of its broad ability to take equity positions in other companies. SBIC's are permitted to own up to 49.9 percent of the voting shares of a company. By contrast, a non-licensed venture capital company that is a subsidiary of a bank holding company may not own more than 4.9 percent of the voting shares of a business. To escape from this limitation some bank holding companies have formed partnerships or venture capital funds. However, a bank holding company can only participate as a limited partner with an ownership interest not to exceed 24.9 percent. Limited partnerships are preferred by those bank holding companies who do not possess the expertise for this type of activity but seek the potential opportunity for high returns.

Through the use of private capital and, in some cases, borrowed money, venture capital companies invest in and lend to new and growing business enterprises. They prefer to invest in and lend to companies that exhibit strong management talent and clearly defined strategies. Many of the companies are yet unknown to the public. Their products either have been introduced to the market or are due to arrive in the next few years. Venture capital companies do not favor pioneering research. Instead, they are interested in financing innovative products, i.e., those next in generation to existing ones, that have a wide market appeal and the potential for strong growth. Such products are preferred because of their shorter development time and possible faster realization of profits. One of the ways a venture capital company makes money is by purchasing the common stock of an emerging company and selling it when the company has grown and the stock has appreciated in value. It also generates earnings by making convertible preferred stock investments and by lending money in the form of subordinated debentures and term loans. Usually lending agreements contain provisions which enable a venture capital company to acquire shares or increase existing holdings through the exercise of warrants or stock options at a later date. Although in most cases some equity interest is taken, venture capital companies, generally, do not acquire a controlling interest in a business they finance.

Once financing commences, venture capital companies typically take an active role in the management of the companies. They usually receive representation on the company's board of directors, which enables them to review budgets and assist in structuring the company's long-range strategic plan. Guiding a company through its developing stages is considered essential for the achievement of equity appreciation and realization of the high returns sought by venture capital companies.

2260.0.2 LOANS AND INVESTMENTS

Investments and lending philosophy may differ among venture capital companies. Some choose to be equity-oriented; that is, they look for higher returns on investments through capital appreciation, while others favor lending in the form of loans or convertible debt securities which provide cash flow to fund operations and service debt. However, most companies will strive for a diversified portfolio in terms of the type of investment and industry mix. The range of financing possibilities associated with lending and/or investing is as follows:

First Step Financing	Funds needed for seed capital to help develop an idea.
Start-up Financing	Funds needed to cover the cost of preparing a business plan, conducting market studies and opening a business.
First Stage Financing	Funds needed to start manufacturing and selling the product(s).
Second Stage Financing	Funds needed for working capital to expand production and build inventories. Company is operating but not yet profitable.
Third Stage Financing	Funds needed to improve the product, build working capital and expand marketing and production facilities. At this point, the company should be generating a profit.
Fourth Stage Financing	Additional working capital funds needed prior to initial public offering which may be as much as a year later.

In addition to the above, venture capital companies will consider financing leveraged buyouts and turnaround situations.

The degree of risk assumed varies according to the stage of financing, i.e., lower stages contain greater risk because of the requirement for longer-term investment discipline than higher stages. Investments in start-up companies typically take five to seven years or more to mature. Because of the high risk involved, most bank-affiliated venture capital companies will avoid the earlier or lower stages of financing. Newly established venture capital companies and especially those that use leverage tend to focus on the intermediate and latter stages of financing. These stages are represented primarily by debenture financing, preferred stock investments, and straight term loans. In structuring a portfolio, a venture capitalist should consider both liquidity and capital protection. The ideal financing mix might entail a limited amount of money invested in common stock with the remainder distributed between debentures, loans, and preferred stock. These instruments will provide income to cover operating expenses and service debt as well as give some protection should the business start to decline. Limited holdings of common stock give the company the opportunity to enhance earnings through capital gains without adversely effecting cash flow. Regardless of the type of financing offered, the ability to exist from an investment or loan through either the issuance of public stock or a cash buyout by a larger company is the goal of a venture capital company.

2260.0.3 FUNDING

A venture capital company may use private capital, leverage, or a combination of both to fund its portfolio of loans and investments. Venture capital companies obtain private capital from their parent organization, either banks or bank holding companies. Generally, private capital is used to fund high-risk, lower-stage investments, although some companies may diversify their portfolio and deploy a portion of capital in loans, debentures and preferred stock. Leverage may be derived from internal and external borrowings. SBIC's that are banking subsidiaries may receive funding in the form of loans from their parent bank. For those companies that are a subsidiary of a bank holding company, internal funding may be provided by the bank holding company from internal cash flow or its external borrowing sources. A bank holding company might borrow from its available bank lines or other borrowing sources to fund venture capital operations. There is, however, one exception; that is, the use of commercial paper proceeds to fund venture capital investments and loans does not appear to qualify under the exemptive provisions of section 3(a)(3) of the Securities Act of 1933. SBIC's and MESBIC's can obtain external financing from the U.S. government and the private sector, while, non-licensed venture capital companies are limited to only private sources for their external financing. Under current SBA regulations, an SBIC can borrow up to $35 million from the federal financing bank with no limit as to the aggregate amount of private debt. Because of the investment restrictions on MESBIC's, the SBA allows them to incur higher leverage. MESBIC's are permitted to borrow up to four times their capital base and issue preferred stock to the SBA up to two times their capital base. MESBIC's also have no limit on the aggregate amount of private debt. All government borrowings ings are through the federal financing bank and carry the guarantee of the SBA. Such borrowings are classified as senior debt.

2260.0.4 PROFITABILITY

Earnings of venture capital companies can fluctuate widely depending on the nature of their activities. Those companies that blend their portfolios with loans, debentures and preferred stock investments tend to be more predictable and less erratic in earnings performance than companies that are strictly equity-oriented. The difference being that loans, debentures and preferred stock provide income to cover operating expenses and debt service requirements, while common stock investments may not yield positive returns for several years. Portfolio diversification tends to smooth out earnings, although the potential for major fluctuations in earnings exists in the future should capital gains be realized on equity investments. In measuring earnings performance, one should consider the combination of net realized earnings (net investment income plus net realized gains (losses) on sale of investments) and net unrealized appreciation or depreciation on investment holdings found in the capital structure of the balance sheet. It is not uncommon to see aggregate returns on capital reach 50

or more. Typically, returns of this magnitude are influenced by either large gains realized on the sale of investments or a substantial amount of unrealized appreciation on investments held or a combination of both. Appreciation or depreciation in portfolio investments represents potential realized gains or losses and, therefore, should be considered in evaluating the company's earnings performance. Specifically, the change in year-to-year net unrealized appreciation or depreciation is a factor that should be considered in analyzing results. When measuring the company's contribution to consolidated earnings, net unrealized appreciation or depreciation should be ignored.

2260.0.5 CAPITALIZATION

In addition to the usual equity components of capital stock, surplus and retained earnings, the capital structure of a venture capital company includes a separate category for net unrealized appreciation (depreciation) on equity interests. Net unrealized appreciation (depreciation) on equity interests represents the gross amount reported under loans and investments less an appropriate provision for taxes. Since unrealized appreciation (depreciation) on equity interests represents future profits (losses) they are measured separately in the equity account rather than in earnings.

There are no industry norms with which to measure capital adequacy. What is known, however, is that the SBA requires a minimum capital investment of $1,000,000 to establish an SBIC. Moreover, regulations governing SBIC's limit the dollar amount of investments and/or loans to a single customer to 20 percent of an SBIC's capital base. Although banks are limited by statute to a maximum capital investment in an SBIC of 4.9 percent of their primary capital, statistics show that SBIC's have substantially less than this limit. By contrast, there are no restrictions as to the amount of capital that a bank holding company may invest in a nonbank affiliated venture capital company. Dependence on capital to fund portfolio loans and investments seems to be preferred as the cost of leverage, at present, cannot provide meaningful spreads. It can be assumed that the larger the capital position the higher the dollar amount available for investing and/or lending to a single customer.

Sustained profitability and satisfactory asset quality are required to maintain financial soundness and capital adequacy. The SBA will consider an SBIC's capital as impaired if net unrealized depreciation and/or operating losses equal 50 percent or more of its capital base. It would seem appropriate to use this guideline for measuring the adequacy of capital of non-licensed venture capital companies that are affiliated with a bank holding company.

2260.0.6 INSPECTION OBJECTIVES

1. To determine whether the company is operating within the scope of its approved activities and within the provisions of the Act and Regulation Y.
2. To determine whether transactions with affiliates, especially banks, are in accordance with applicable statutes and regulations.
3. To determine the quality of the asset portfolios and whether the allowance for losses is

adequate in relation to portfolio risk and whether the nonaccrual policy is appropriate.

4. To determine the viability of the company as a going concern, and whether its affiliate status represents a potential or actual adverse influence upon the parent holding company and its affiliated bank and nonbank subsidiaries and the condition of the consolidated corporation.

5. To determine whether the company has formal written policies and procedures relating to lending and investing.

6. To determine if such policies and procedures are adequate and that management is operating in conformance with the established policies.

7. To assess management's ability to operate the company in a safe and sound manner.

8. To suggest corrective action when policies, practices or procedures are deficient, or when asset quality is weak, or when violations of laws or regulations have been noted.

2260.0.7 INSPECTION PROCEDURES

2260.0.7.1 Pre-Inspection

All SBIC's and MESBIC's are subject to comprehensive regulations and annual examinations administered by the SBA. Therefore, it is not necessary to conduct a full scope inspection of these subsidiaries. The bank holding company inspection should focus on the quality of assets, as disclosed in the annual director's valuation and financial statements submitted to the SBA on an annual basis, transactions with affiliates and an overall financial evaluation.

The decision whether the operations of a non-licensed venture capital company will be inspected ''on-site'' is based on the availability and adequacy of data from either the parent holding company or that which is obtained upon request from the subsidiary. The following information should be obtained and thoroughly reviewed prior to making a decision to go ''on-site'':

1. Minutes of the board and executive committee meetings since inception of company or the date of the previous inspection;

2. Comparative interim and fiscal financial statements containing value accounting adjustments, including the year-end filing with the SBA;

3. Listing of contingent liabilities, including any pending material litigation;

4. Latest director's valuation of loans and investments and results of latest internal loan or credit review;

5. Copies of the most recent internal and external audit reports;

6. Trial balance of all loans and investments, indicating the percent ownership of a company involving an equity interest;

7. Listing of loans, debentures and preferred stock on which scheduled payments are in arrears 30 days or more or on which payments are otherwise not being made according to original terms;

8. Details of internal and external borrowing arrangements; and

9. Any agreements, guarantees or pledges between the subsidiary and its parent holding company or affiliates.

After reviewing the above information, a decision whether or not to conduct an on-site inspection must be made. Some of the determinants of this decision would include: relative size; current level and trend of earnings; asset quality as indicated in the director's valuation of loans and investments; and the condition of the company when last inspected. From the information provided, it might be determined that the company is operating properly and is in sound condition. In such a case, an on-site inspection may not be warranted. Conversely, a deteriorating condition might be detected which would warrant a visit even though a satisfactory condition had been determined during the previous inspection. All non-licensed venture capital companies should be inspected on-site at least once every three years.

2260.0.7.2 On-Site Inspection

If the decision was made to conduct an ''on-site'' inspection of the subsidiary, the examiner should expand the scope of the review to include these additional procedures:

1. Hold a brief meeting with the chief executive officer of the company to establish contact and present a brief indication of the scope of the inspection;

2. Review the company's policy statements for loans, investments, nonaccruals, and charge-offs;

3. Review the latest internal review by the company's directors or the loan review department of the bank affiliate or bank holding company;

4. Conduct an independent review of the portfolio;

a. Establish the minimum dollar of loans and investments to be reviewed to achieve at least 70 percent coverage of the portfolio;

b. Review loans and investments in sample, giving consideration to the following:

- Latest balance sheet and income data;
- Profitability projections;
- Product(s) being produced by customer and their market acceptance;
- Business plan;
- Extent of relationship with customer;
- Funding sources; and
- Ultimate source of repayment.

c. Discuss the more serious problem loans and investments with management;

d. Classify, if necessary, those loans and investments that exhibit serious weaknesses where collectibility is problematical or worse. Lower classification criteria must accompany these assets, which possess a higher degree of credit risk than found in other types of nonbank lending;

e. Determine the diversification of risk within the portfolio, i.e., the mix of loans and investments and the type of industries financed;

f. Review the adequacy of the allowance for loan losses and determine the reasonableness of the amount of unrealized appreciation or depreciation reported on the balance sheet in conjunction with the asset evaluation; and

g. Determine whether the board of directors or parent holding company has established credit limits for the maximum amount of loans and investments to be extended to a single customer. Verify adherence to the limits.

5. Review equity investments for compliance with the 4.9 percent maximum limitation to any one customer;

6. Verify office locations and activities with system approvals;

7. Compare company's general ledger with statements prepared for the latest FR Y–6;

8. Review the quality and liquidity of other investment holdings;

9. Review and classify, if necessary, assets acquired in liquidation of a customer's business due to default. Determine compliance of divestiture period with section 4(c)(2) of The Bank Holding Company Act;

10. Review the manner and frequency in which subsidiary management reports to the parent holding company;

11. Follow-up on matters criticized in the most recent audit reports and the previous inspection report on the subsidiary; and

12. Assess the expertise of subsidiary management and awareness of subsidiary directors.

2260.0.7.3 Matters Warranting Recommendation in Inspection Report

Deficiencies or concerns that warrant citation in the inspection report for the attention of management are:

1. Lack of policies and/or controls in the lending and investing functions;

2. Improper diversification of risk in the loan and investment portfolio;

3. Adverse tie-in arrangements with the affiliate bank(s):

4. Lack of management expertise;

5. Impairment of capital as a result of operating losses or high unrealized depreciation on equity interests or a combination of both; and

6. Lack of adequate reporting procedures to parent holding company management.

The Bank Holding Company Act of 1956 (BHC Act) was enacted to limit the expansion of banking institutions into nonbanking activities. A bank holding company was defined in the BHC Act as an entity that owned or controlled 25 percent or more of the voting shares of two or more banks; companies owning only one bank were exempted from regulation under the BHC Act.

During the 1960s, the number of commercial enterprises that purchased one bank, engaged in nonbanking activities, and remained exempt from regulation grew dramatically. As a result of this change in the structure of bank ownership, Congress enacted the Bank Holding Company Act Amendments of 1970. Of these amendments, the most significant is the extension of the act to grant to the Federal Reserve Board the authority to regulate the activities of one-bank holding companies.

In 1978, Congress passed the International Banking Act (IBA). Section 8 of the IBA expanded the nonbanking prohibitions of the BHC Act to foreign banks that engage in the business of banking in the United States directly through a branch or agency or indirectly through a subsidiary commercial lending company. This expanded the nonbanking restrictions beyond simply covering foreign banks that own or control U.S. banks or bank holding companies. However, section 2(h) of the BHC Act provides foreign organizations that are principally engaged in the business of banking outside the United States with exemptions from the nonbanking prohibitions of the BHC Act. Further exemptions have been granted by the Board's discretionary authority under section 4(c)(9) when such exemptions were in the public interest and were consistent with the purposes of the BHC Act.

Under section 4(c) of the BHC Act, Congress exempted a limited number of investments from the general prohibition against owning or controlling shares of nonbank concerns. Section 4(c)(8) permitted investment in ''shares of any company the activities of which the Board after due notice and opportunity for hearing has determined by regulation to be so closely related to banking or managing or controlling banks as to be a proper incident thereto.'' The act also provided that any bank holding company might apply to the Board for permission to engage in an activity that had not yet been determined to be permissible if the applicant was of the opinion that the activity in its particular circumstances was closely related to banking or managing or controlling banks. Section 225.28(b) of the Board's Regulation Y lists permissible nonbanking activities that the Board has deemed to meet these criteria. (See appendix 1.) The list of permissible nonbanking activities has been expanded at various times.

The Board also has permitted by order, on an individual basis, certain activities that it has considered to be closely related to banking under section 4(c)(8) of the BHC Act. In doing so, the Board did not expand the list of permissible activities under section 225.28(b) of Regulation Y. (For a list of such activities, see appendix 2.)

In determining whether the performance of a nonbank activity by a bank holding company or the acquisition of a nonbank firm by a bank holding company was a proper incident to banking, the Board applied a ''public interest test.'' The Board determined whether the proposed new activity or proposed acquisition ''[could] reasonably be expected to produce benefits to the public, such as greater convenience, increased competition, or gains in efficiency, that outweigh possible adverse effects, such as undue concentration of resources, decreased or unfair competition, conflicts of interest, or unsound banking practices.''

An interpretation of Regulation Y (12 C.F.R. 225.126) dated April 28, 1972, and amended September 20, 1972, listed activities that the Board determined do not satisfy the ''so closely related'' test under section 4(c)(8). The Board subsequently determined that a number of other activities do not satisfy the closely related test. (For a complete list of these impermissible activities, see appendix 3, and, for a brief description of a selected number of the activities denied by the Board, see section 3700.0 et seq.)

As the primary regulator for bank holding companies and their directly held nonbank subsidiaries, the Federal Reserve System conducts inspections of their operations, financial condition, and compliance with appropriate banking and other related statutes and regulations. Inspection personnel are called upon to evaluate the current condition of the organizations, as well as their future prospects.

On August 10, 1987, the Competitive Equality Banking Act of 1987 was signed into law. This act redefined the definition of ''bank'' in section 2 of the BHC Act so that an FDIC-insured institution is deemed a bank.

State-Authorized Activities of Savings Banks

A special rule was established for qualified savings banks (state-chartered, FDIC-insured institutions organized before March 5, 1987) that are subject to the BHC Act. (See section 2090.7.) In accordance with section 3 of the BHC Act, a qualified savings bank may engage in any nonbanking activity, except insurance activities, either directly or through a subsidiary, that it is permitted to conduct directly as a state-chartered savings bank, even if those activities are not otherwise permissible for bank holding companies. To engage in those activities, however, a qualified savings bank must remain a savings bank and a subsidiary of a savings bank holding company (a company that controls one or more qualified savings banks whose total aggregate assets, upon formation and at all times thereafter, constitute at least 70 percent of the assets of the holding company). With respect to insurance activities, qualified savings banks may engage in underwriting and selling savings bank life insurance if the savings bank is located in Connecticut, Massachusetts, or New York, and if certain other conditions are met.

BHCs Engaging in Nonbanking Activities in Foreign Countries

A bank holding company has greater leeway to perform nonbanking activities abroad than in the United States in that it may engage in nonbanking activities abroad that would not be permissible in the United States. However, activities abroad are subject to limitations. Section 211.8 of Regulation K requires a bank holding company to limit its direct and indirect activities abroad to those usual in connection with banking and financial activities and to necessary related activities. Section 211.10 also lists particular activities that are permissible abroad and provides rules regarding when a bank holding company must submit an application to engage in such activities directly or through investments.

Edge Act or Agreement Corporations

A bank holding company may own an Edge Act or agreement corporation. The Federal Reserve Act and Regulation K govern the permissible activities of Edge Act or agreement corporations. An Edge Act or agreement corporation is an international banking vehicle that may only engage in listed or approved activities that are incidental to international or foreign business. (See 12 C.F.R. 211.6) The restriction generally permits an Edge Act or agreement corporation to engage only in international banking or financial activities. (See 12 C.F.R. 211.8.) A separate manual, *Guidelines and Instructions for Examination of Edge Corporations*, sets forth the rules and procedures for examining Edge Act or agreement corporations and for determining whether their activities are permissible.

Companies that own only an Edge Act or agreement corporation. Any company, other than a bank, that acquired an Edge Act or agreement corporation after March 5, 1987, must conform its activities to section 4 of the BHC Act.

Underwriting and Dealing in Debt and Equity Securities

Beginning in January 1989, certain nonbanking subsidiaries of bank holding companies were approved to underwrite and deal in debt or equity securities (excluding open-end investment companies), subject to the prohibition on affiliation with an organization dealing in securities under section 20 of the Glass-Steagall Act. (See 1989 FRB 192.) The Board delayed commencement of the activity by each applicant until it determined that the applicant had established the necessary managerial and operational infrastructure to commence the expanded underwriting and dealing activity and to comply with the Board order. The applicant's capital plan had to be determined to be adequate along with the necessary policies and procedures needed to comply with the Board's order. The Board's order requires that loans to and capital investments in the underwriting subsidiary be deducted from the bank holding company's capital, as provided for in the Board's capital adequacy guidelines. The Board further confirmed that the activities could not be conducted in any other subsidiary other than the Board-approved section 20 subsidiary. (See section 3600.21.4.)

As for underwriting and dealing in equity securities, the Board stated in the order that it would review within a year whether applicants could commence the activity. The first Board authorization to commence underwriting and dealing in equity securities was given on September 20, 1990, subject to the commitments given by the bank holding company in connection with its respective Board order, including its commitment to maintain the capital of its section 20 subsidiary at levels necessary to support its activities and commensurate with industry standards, and to increase the capital of the section 20 subsidiary accordingly as it grew.

Modifications to the Board's Orders Authorizing BHC Subsidiaries to Underwrite and Deal in Bank-Ineligible Securities Consistent with Section 20 of the Glass-Steagall Act

The Board announced its approval of modifications to its previous section 20 authorizations by order on September 21, 1989 (1989 FRB 751). The modifications (1) raised from 5 percent to 10 percent (currently 25 percent) the revenue limit on the amount of total revenues a section 20 subsidiary might derive from bank-ineligible securities underwriting and dealing activities, and (2) permitted underwriting and dealing in the securities of affiliates, consistent with section 20 of the Glass-Steagall Act, if the securities were rated by an unaffiliated, nationally recognized statistical rating organization or were issued or guaranteed by the Federal National Mortgage Association (Fannie Mae), the Federal Home Loan Mortgage Corporation (FHLMC), or the Government National Mortgage Association (GNMA), or if they represented interests in such obligations.

Acting as Agent in the Private Placement of All Types of Securities and Acting as Riskless Principal in Buying and Selling Securities

In another Board order, the Board authorized a bank holding company to transfer its private-placement activities from its commercial bank subsidiary to its section 20 subsidiary. The section 20 subsidiary would act as agent in the private placement of all types of securities, including the provision of related advisory services, and would buy all types of securities on the order of investors as a "riskless principal." The Board concluded that the section 20 subsidiary's private placement of debt and equity securities within the limits proposed did not involve the underwriting or public sale of securities for the purposes of section 20 of the Glass-Steagall Act. The revenues derived therefrom should not be subject to the 25 percent revenue limitation placed on bank-ineligible securities activities. (See section 3230.4.)

Foreign Banks Authorized to Operate Section 20 Subsidiaries to Underwrite and Deal in Corporate Debt, Commercial Paper, and Other Securities

In a Board order (1990 FRB 158), the Board authorized a foreign bank to operate a section 20 subsidiary under the bank to underwrite and deal in corporate debt, commercial paper, and other securities. (Securities issued by open-end investment companies are not included.) The foreign bank operated outside the United States but owned a subsidiary bank in the United States. To achieve equality between the domestic and foreign banking operations in the United States and in an effort to negate any advantages that a foreign bank might have over a domestic bank, the Board considered the foreign bank as a bank holding company even though the bank was not part of a bank holding company structure. In so doing, the Board imposed restrictions on the section 20 subsidiary. The foreign bank might fund the section 20 subsidiary, but that action required prior Board approval. In addition, the section 20 subsidiary might not borrow from its parent bank. Any loans to, transfers of assets to, or investments in the section 20 subsidiary also required Board approval. (See 1990 FRB 158, 455, 554, 568, 573, 652, and 683.)

Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (FIRREA)

FIRREA became law on August 9, 1989. The law revised section 4(c)(8) of the BHC Act and authorized the Board to approve applications from bank holding companies for the acquisitions of savings associations. The Board thus revised section 225.28(b)(4)(i) of Regulation Y to include as a permissible nonbanking activity the owning, controlling, or operating of a savings association, if the savings association engaged only in deposit-taking, lending, and other activities permissible for bank holding companies. The legislation required the Board to remove tandem restrictions found in previous Board orders that were not prohibited by FIRREA and, in approving applications, to confine limitations on transactions between the savings association and its bank holding company affiliates to those required by sections 23A and 23B of the Federal Reserve Act. FIRREA made sections 23A and 23B applicable to savings associations as though they were member banks. Two exceptions apply: (1) no extensions of credit may be granted by a savings association to an affiliate unless the affiliate is engaged only in activities permissible for bank holding companies under the BHC Act, and (2) savings associations may not purchase or invest in securities of an affiliate other than shares of a subsidiary. The legislation also provided for a ''sister-bank'' exemption from the provisions of sections 23A and 23B of the Federal Reserve Act. (See sections 2020.1.1.6 and 2090.8.1.)

1992 Revisions to the Regulation Y List of Nonbanking Activities—the ''Laundry List''

During 1992, the Board initiated several actions that affected certain nonbanking activities. The first action, effective May 18, 1992, amended section 225.28(b) of Regulation Y with regard to tangible personal property leases. Subject to the stated limitations, a bank holding company can rely on estimated residual values of up to 100 percent of the acquisition costs of the leased property in order to recover the bank holding company's leasing costs. Previously, the nonbanking activity had only been approved by Board order. (See the initial Board order at 1990 FRB 462 and the subsequent Board orders at 1990 FRB 960 and 1991 FRB 187 and 490.)

The Board issued a revised interpretive rule, effective August 10, 1992, regarding investment advisory activities of bank holding companies to expressly provide that a bank holding company or its nonbank subsidiary may act as agent for customers in the brokerage of shares of an investment company advised by the holding company or any of its subsidiaries. In addition, the revision provided that a bank holding company or its nonbank subsidiary may provide investment advice to customers regarding the purchase or sale of shares of an investment company advised by an affiliate. In both instances, the Board requires certain disclosures to be made to address potential conflicts of interest or adverse effects. (See 12 C.F.R. 225.125(h) of Regulation Y.)

Effective September 10, 1992, the Board added two nonbanking activities to Regulation Y that were previously approved by Board order. The two activities dealt with full brokerage services and financial advisory services. (See 12 C.F.R. 225.28(b)(6) and (7).)

Comprehensive Revision of Regulation Y

In August 1996, the Board proposed comprehensive revisions to Regulation Y that were designed to significantly reduce regulatory burden, improve efficiency, and eliminate unwarranted constraints on credit availability. The proposal followed a Board review of its regulations that was required by the Riegle Community Development and Regulatory Improvement Act of 1994. The changes (1) removed a number of restrictions on the permissible nonbanking activities of BHCs, (2) expanded and reorganized the regulatory list of permissible nonbanking activities to include numerous nonbanking activities that had been previously approved only by Board order,[1] (3) streamlined the application/notice process for BHCs and the procedures governing change in bank control notices, and (4) revised the tying rules to enhance banking organizations' ability to provide customer discounts on services. Included were changes that streamlined the procedures for well-run BHCs to seek Federal Reserve System approval to acquire additional banks within certain limits. The Board approved these revisions to Regulation Y, effective April 21, 1997.

Limitation on Board-Approved Nonbanking Activities

The Gramm-Leach-Bliley Act (the GLB Act) amended the BHC Act to limit bank holding companies that are not financial holding companies to engaging only in ''activities which had been determined by the Board by regulation or order under section 4(c)(8) of the BHC Act and section 225.28 of Regulation Y before November 12, 1999 (the approval date of the GLB Act), to be so closely related to banking as to be a proper incident thereto (subject to such terms and conditions contained in such regulation or order, unless modified by the Board)'' (12 U.S.C. 1843(c)(8)). Prior to November 12, 1999, the

1. See subsection 3000.0.2, appendix 1. See also section 225.28(b) of Regulation Y. In addition to these activities, other activities have been approved by Board order. For a list of those activities, see subsection 3000.0.3, appendix 2.

Board had determined that ''[a]ny activity usual in connection with making, acquiring, brokering, or servicing loans or other extensions of credit, as determined by the Board'' is closely related to banking. Accordingly, the Board retains authority after the GLB Act to define the scope of this section 4(c)(8) activity and to modify the terms and conditions that apply to the activity.

Financial Holding Companies

The GLB Act, approved in November 1999, amended section 4 of the BHC Act and expanded the powers of qualifying BHCs and foreign banks that elect to become financial holding companies (FHCs). An FHC is defined in the GLB Act as a BHC that meets certain eligibility requirements. The law repealed those provisions of the Glass-Steagall Act and the BHC Act that restricted the ability of BHCs to affiliate with securities firms and insurance companies. For a bank holding company to become an FHC and be eligible to engage in new activities authorized under the GLB Act, the GLB Act requires that all depository institutions controlled by the BHC be well capitalized and well managed. With regard to a foreign bank that operates a branch or agency or that owns or controls a commercial lending company in the United States, the GLB Act requires the Board to apply comparable capital and management standards that give due regard to the principle of national treatment and equality of competitive opportunity.

Qualifying BHCs that elect to become FHCs can engage in a broad array of financially related activities, including (1) securities underwriting and dealing, (2) insurance agency and insurance underwriting activities, and (3) merchant banking activities. With respect to merchant banking, the GLB Act (1) permits an FHC to retain a merchant banking investment only as long as necessary to dispose of the investment on a reasonable basis consistent with the financial viability of its merchant banking activities, and (2) provides that an FHC may not routinely manage or operate a company held as a merchant banking investment except as necessary to obtain a reasonable return on the investment.

The statute also sets forth parameters for the relationships between the Federal Reserve and other regulators. The statute differentiates between the Federal Reserve's relations with regulators of depository institutions and functional regulators, such as those for nonbanking or nonfinancial activities such as insurance, securities, and commodities activities.

An FHC may engage in any other activities that the Board and the Secretary of the Treasury jointly determine to be financial in nature or incidental to financial activities. An FHC may also engage in any nonfinancial activity that the Board determines (1) is complementary to a financial activity and (2) does not pose a substantial risk to the safety and soundness of depository institutions or the financial system generally. The activities of BHCs and foreign banks that are not FHCs continue to be limited to activities currently authorized under section 4(c) of the BHC Act to be closely related to banking and permissible for BHCs. No additional activities may be found to be so closely related to banking as to be a proper incident thereto after November 11, 1999, thus limiting the ability of BHCs and foreign banks that are not FHCs to expand their activities.

In this manual, the sections in the 3900 series have been designated for FHCs. Those sections discuss FHC qualification requirements (domestic and foreign); permissible nonbanking FHC activities designated by statute (for example, merchant banking activities) or regulation, including activities jointly approved by the Board and the Secretary of the Treasury; and the supervisory approach and guidance for FHCs.

To implement the provisions of the GLB Act that govern FHCs, the Board amended Regulation Y by adding subpart I for FHCs. The provisions of an interim rule became effective March 11, 2000, and the Board approved a final rule effective December 21, 2000. Key provisions of the final rule are discussed within the 3900 sections of this manual. With respect to permissible activities of FHCs, the rule includes activities that previously were determined to be closely related to banking under section 225.28 of Regulation Y, activities that are usual in connection with transactions of banking abroad (including those in section 211.10 of Regulation K), and other activities defined as financial in nature by the GLB Act.

3000.0.1 CATEGORIES OF NONBANKING ACTIVITIES

Section 4(c)(8) of the BHC Act authorizes bank holding companies to engage directly or through a subsidiary in activities that the Board determined before November 12, 1999, to be so closely related to banking or managing or controlling banks as to be a proper incident thereto. The Board and the courts established the following guidelines for determining whether a nonbanking activity is closely related to banking:[2]

1. whether banks have generally provided the service
2. whether banks generally provide services that are operationally or functionally so similar to the proposed service as to equip them particularly well to provide the proposed service
3. whether banks generally provide services that are so integrally related to the proposed service as to require their provision in specialized form

In addition, before November 12, 1999, the Board considered other factors in deciding what activities were closely related to banking.[3] For those activities found to be closely related to banking or to managing or controlling banks, the Board also must find that the proposed activity is a ''proper incident'' to banking and that performance of an activity by a bank holding company could reasonably be expected to produce benefits to the public (such as greater convenience, increased competition, or gains in efficiency) that outweigh possible adverse effects (such as undue concentration of resources, decreased or unfair competition, conflicts of interest, or unsound banking practices). The following describes three categories of bank holding company nonbanking activities:

1. those that have been found to be permissible and are listed in Regulation Y, the so-called laundry list activities (see appendix 1)
2. those that are permissible by Board order only (see appendix 2)
3. those that have been denied by the Board (see appendix 3)

2. *National Courier Association v. Board of Governors,* 516 F. 2d 1229 (D.C. Cir. 1975).

3. *Alabama Association of Insurance Agents v. Board of Governors,* 533 F.2d 224 (5th Cir. 1976), *cert. denied,* 435 U.S. 904 (1978).

3000.0.2 APPENDIX 1—Activities Approved by the Board as Being Considered "Closely Related to Banking" Under Section 4(c)(8) of the Bank Holding Company Act (Section 225.28(b) of Regulation Y)

Permitted by Regulation[1]	*Year Added to Regulation Y*
Note: The bulleted items in this appendix are provided for historical reference only. The narrative before the bulleted items reflects the current Regulation Y authorization.	
1. Extending credit and servicing loans	1971
Making, acquiring, brokering, or servicing loans or other extensions of credit (including factoring, issuing letters of credit, and accepting drafts) for the company's account or the account of others.	
2. Activities related to extending credit[2]	
a. Appraising	
(1) Real estate appraising	1980
(2) Personal property appraising	1986
b. Arranging commercial real estate equity financing	1983
c. Check-guaranty services	1986
d. Collection agency services	1986
e. Credit bureau services	1986
f. Asset management, servicing, and collection activities	1997
g. Acquiring debt in default	1995
h. Real estate settlement servicing	1997
3. Leasing personal or real property or acting as agent, broker, or adviser in leasing such property	
• Personal property leasing[3]	1971
• Real property leasing	1974
4. Operating nonbank depository institutions	
a. Owning, controlling, or operating an industrial bank, Morris Plan bank, or industrial loan company so long as the institution is not a bank	1971
b. Owning, controlling, or operating a savings association, if the savings association engages in deposit-taking activities, lending, and other activities that are permissible for bank holding companies	1989
5. Trust company functions or activities	1971
6. Financial and investment advisory activities: acting as an investment adviser or financial adviser to any person, including (without limiting these activities in any way)—	1971

Permitted by Regulation[1]	*Year Added to Regulation Y*
a. Serving as an investment adviser to an investment company registered under the Investment Company Act of 1940, including sponsoring, organizing, and managing a closed-end investment company	1972
• Investment or financial advising	1971
• Advisory services to open-end (mutual fund) investment companies	1972
b. Furnishing general economic information and advice, general economic statistical forecasting services, and industry studies	1984
c. Providing advice in connection with mergers, acquisitions, divestitures, investments, joint ventures, leveraged buyouts, reorganizations, recapitalizations, capital structurings, financing transactions, and similar transactions,[4] and conducting financial feasibility studies[5]	1992
• Financial futures and options on futures	1986
d. Providing information, statistical forecasting, and advice with respect to any transaction in foreign exchange, swaps and similar transactions, commodities, and any forward contract, option, future, option on a future, and similar instruments	1992
• Financial futures and options on futures	1986
• Providing financial advice to—	
— state and local governments and	1973
— foreign governments, including foreign municipalities and agencies of foreign governments, such as with respect to the issuance of their securities	1992
• Inclusion of any investment or financial advisory activity without restriction	1997
• Discretionary investment advice to be provided to any person (includes investment advice regarding derivative transactions to institutional or retail customers as an investment, commodity trading, or other adviser) regarding contracts related to financial or nonfinancial assets (such advice is no longer restricted to institutional customers)	1997
• Financial and investment advice (or any permissible nonbanking activity) can be provided in any combination of permissible nonbanking activities listed in Regulation Y	1997
e. Providing educational courses and instructional materials to consumers on individual financial-management matters	1986
f. Providing tax-planning and tax-preparation services	1986
7. Agency transactional services for customer investments (principal positions)	
a. Securities brokerage services (including securities clearing and/or securities execution services on an exchange) for the account of customers and does not include securities underwriting or dealing	
(1) Securities brokerage services (including securities clearing and/or securities execution services on an exchange), whether alone or	1982
(2) In combination with advisory services and incidental activities (including related securities credit activities and custodial services)	1992
b. Riskless-principal transactions	1997
c. Private-placement services	1997
d. Futures commission merchant activities	1984
• A nonbanking subsidiary may act as an FCM with respect to any exchange-traded futures contract and options on a futures contract based on a financial or nonfinancial commodity	1997

Permitted by Regulation[1]	Year Added to Regulation Y
e. Other transactional services such as providing to customers as agent transactional services with respect to the following:	1997
(1) Swaps and similar transactions	
(2) Investment transactions as principal[6]	
(3) Transactions permissible for a state member bank	
(4) Any other transaction involving a forward contract, an option, futures, an option on a futures or similar contract (whether traded on an exchange or not) relating to a commodity that is traded on an exchange	
8. Investment transactions as principal	
a. Underwriting and dealing in government obligations and money market instruments	1984
b. Investing and trading activities. Engaging as principal in the following:	
(1) Foreign exchange	1984
(2) Forward contracts, options, futures, options on futures, swaps, and similar contracts, whether traded on exchanges or not, based on any rate, price, financial asset (including gold, silver, platinum, palladium, copper, or any other metal approved by the Board), nonfinancial asset, or group of assets, other than a bank-ineligible security, if the transaction meets certain requirements (A bank-ineligible security is any security that a state member bank is not permitted to underwrite or deal in under 12 U.S.C. 24 and 335.)	1997
(3) Forward contracts, options, futures, options on futures, swaps, and similar contracts, whether traded on exchanges or not, based on an index of a rate, a price, or the value of any financial asset, nonfinancial asset, or group of assets, if the contract requires cash settlement	1997
9. Management consulting and counseling activities	
a. Providing management consulting advice on any matter (financial, economic, accounting, or audit) to any other company[7]	
• Unaffiliated banks (depository institutions)	1974
• Nonbank depository institutions	1982
• Other unaffiliated depository institutions	1997
• Any financial, economic, account, or audit matter to any other company	1997
b. Employee benefits consulting services	1997
c. Career counseling services	1997
10. Support services	
a. Courier services	1973
b. Printing and selling MICR-encoded checks and related documents	1997
11. Insurance agency and underwriting	
a. Credit insurance: acting as principal, agent, or broker for insurance (including home mortgage redemption insurance)	
• Acting as insurance agent or broker primarily in connection with credit extensions[8]	1971
• Underwriting credit life and credit accident and health insurance related to an extension of credit	1972

Permitted by Regulation[1]	*Year Added to Regulation Y*
b. Finance company subsidiary: insurance agent or broker for extension of credit by finance company subsidiary	1982
c. Insurance agency activities in small towns	1984
d. Insurance agency activities conducted on May 1, 1982	1984
e. Supervision of retail insurance agents	1984
f. Insurance agency activities by small bank holding companies	1984
g. Insurance agency activities conducted before 1971	1984
12. Community development	
a. Financing and investment in community development activities	1971
b. Advisory and related services designed to promote community welfare	1997
13. Issuance and sale of payment instruments	
a. Issuance and sale of retail money orders	1984
b. Sale of savings bonds	1979
c. Issuance and sale of traveler's checks	1981
14. Data processing	
a. Providing data processing and data transmission services; facilities (including data processing and data transmission hardware,[9] software, documentation, or operating personnel); databases; advice; and access to services, facilities, or databases by any technological means	
• Providing bookkeeping and data processing	1971
• Data processing and transmission services	1982
• Providing data processing and transmission advice to anyone on processing and transmitting banking, financial, and economic data	1997
b. Conducting data processing and data transmission activities not described in "a." that are *not* financial, banking, or economic[10]	1997

1. See section 225.28(b) of Regulation Y for the details of the regulatory authorizations.
2. A Board staff opinion, issued July 9, 2002, concluded that a BHC's certain proposed flood zone–determination services are usual in connection with making mortgage loans and that these activities are within the scope of permissible activities related to extending credit under section 225.28(b)(2) of Regulation Y.
3. The provision of higher residual value leasing for tangible personal property was added to Regulation Y in 1992, including acting as agent, broker, or adviser in leasing such property.
4. The words "and similar transactions" were added in 1997.
5. Feasibility studies do not include assisting management with the planning or marketing for a given project or providing general operational or management advice.
6. Transactions described in section 225.28(b)(8) of Regulation Y.
7. Management consulting services may be provided to other customers not described in section 225.28(b)(9) of the rule, but the revenues derived therefrom are subject to a 30 percent annual revenue limitation.
8. Scope narrowed to conform to court decisions in 1979 and 1981; in 1982, it was further narrowed by title VI of the Garn–St Germain Depository Institutions Act.
9. Beginning in April 1997, the general-purpose hardware may not constitute more than 30 percent (previously 10 percent) of the cost of any package offering.
10. The total revenue may not exceed 30 percent (increased to 49 percent, effective January 8, 2004) of the company's total annual revenues derived from data processing, data storage, and data transmission activities.

3000.0.3 APPENDIX 2—Activities Considered ''Closely Related to Banking'' Under Section 4(c)(8) of the Bank Holding Company Act

	Permitted by Order on an Individual Basis	*Year Approved*	*Manual Section 3600.*
1.	Operating a ''pool-reserve plan'' for the pooling of loss reserves of banks with respect to loans to small businesses	1971	1
2.	Operating an article XII New York investment company	1977	5.1
3.	Underwriting and dealing in commercial paper to a limited extent	1987	21.1
4.	Underwriting and dealing in, to a limited extent, municipal revenue bonds, mortgage-related securities, and commercial paper	1987	21.2
5.	Underwriting and dealing in, to a limited extent, municipal revenue bonds, mortgage-related securities, consumer receivable–related securities, and commercial paper	1987	21.3
6.	Issuing and selling mortgage-related securities backed by the guarantees of the Government National Mortgage Association	1988	23
7.	Engaging in title insurance agency activities (approved under exemption G of the Garn–St Germain Depository Institutions Act of 1982)	1988	17.1
8.	Underwriting and dealing in, to a limited extent, corporate debt and equity securities	1989	21.4
9.	Acting as a sales-tax refund agent	1990	24.1
10.	Providing real estate settlement activities through a permissible title insurance agency (exemption G companies only)	1990	26
11.	Providing administrative and certain other services to mutual funds	1993	27
12.	Acting as a dealer-manager in connection with cash-tender and exchange-offer transactions	1993	21.5
13.	Privately placing limited partnership interests	1994	8
14.	Engaging in real estate title abstracting	1995	30
15.	Providing employment histories to third parties	1995	29
16.	Underwriting ''private ownership'' industrial development bonds by a section 20 company	1995	21.6
17.	Serving as a commodity pool operator of investment funds engaged in purchasing and selling futures and options on futures on certain financial and nonfinancial commodities	1996	13.1

Permitted by Order on an Individual Basis	Year Approved	Manual Section 3600.
18. Development of broader marketing plans and advertising, sales literature, and marketing materials for mutual funds (see 1997 FRB 678)	1997	28
19. Sale of government services involving (see 1998 FRB 481)—	1998	25
a. postage stamps and postage-paid envelopes b. public transportation tickets and tokens c. vehicle registration services (including the sale and distribution of license plates and license tags for motor vehicles) d. notary public services		
20. Operating a securities exchange	1999	6
21. Acting as a certification authority for digital signatures	1999	7

3000.0.4 APPENDIX 3—Activities Considered Not to Be "Closely Related to Banking" Under Section 4(c)(8) of the Bank Holding Company Act

	Activities Denied by the Board	*Year Denied*
1.	Insurance premium funding ("equity funding") (combined sales of mutual funds and insurance)	1971
2.	Underwriting general life insurance not related to credit extension	1971
3.	Real estate brokerage	1972
4.	Land investment and development	1972
5.	Real estate syndication	1972
6.	General management consulting	1972
7.	Property management	1972
8.	Trading in platinum and palladium coin and bullion[1]	1973
9.	Armored car service[2]	1973
10.	Sale of level term credit life insurance	1974
11.	Underwriting mortgage guarantee insurance	1974
12.	Computer output microfilm services[3]	1975
13.	Operating a travel agency	1976
14.	Underwriting property and casualty insurance	1978
15.	Real estate advisory activities	1980
16.	Certain contract key entry services	1980
17.	Offering investment notes with transactional features	1982
18.	Engaging in "pit arbitrage" spread transactions on commodities exchanges to generate trading profits	1982
19.	Engaging in the publication and sale of personnel tests and related materials	1984
20.	Providing credit ratings on bonds, preferred stock, and commercial paper	1984
21.	Providing independent expert actuarial opinions of a general nature for purposes such as divorce action and personal injury litigation	1984
22.	Acting as a specialist in foreign-currency options on a securities exchange	1985

Activities Denied by the Board	*Year Denied*
23. Title insurance activities (See the Board letter dated March 17, 1986, re: Independence Bancorp, Inc. and the Board order at 1989 FRB 31)	
24. Acting as a broker for customers in the purchase and sale of forward contracts based on certain financial and nonfinancial commodities, and acting as the primary clearing firm for professional floor traders[4]	1991

1. Authorized by the Board in 1995 FRB 190 (platinum) and 1996 FRB 571 (palladium).

2. On June 18, 1990, the Board determined that the activity of providing armored car services to the general public is closely related to banking (see 1990 FRB 676). In order for the Board to approve a nonbank activity for a bank holding company, the Board must also find that the activity is a "proper incident thereto." On February 10, 1993, the Board denied the application (1993 FRB 352), finding that the proposed transactions posed potential violations of section 23B of the Federal Reserve Act and that the applicant had failed to prove that the activity is a proper incident to banking.

3. The Board's interpretation of Regulation Y at 12 C.F.R. 225.123 was amended on November 25, 1987, by deleting item (e)(4) relating to the impermissibility of the activity (see 52 *Federal Register* 45160–45161 and 1987 FRB 933).

4. The Board subsequently approved this activity by Board order. (See 1997 FRB 138.)

As an FDIC insured institution, a savings bank qualifies as a ‘‘bank’’ under section 2(c) of the BHC Act, as amended by section 101(a) of the Competitive Equality Banking Act of 1987 (‘‘CEBA’’). CEBA amended the BHC Act, in section 3(f), stating that any qualified savings bank, which is a subsidiary of a bank holding company, could engage directly, or through a subsidiary, in any nonbanking activity, except for certain insurance activities, that it is permitted to engage in by State law—including activities which are not otherwise permitted for bank holding companies under section 4(c)(8) of the BHC Act. In order for a qualified savings bank, that is a subsidiary of a bank holding company, to engage in such activities, however, the bank holding company must be a savings bank holding company as defined in section 2(l) of the BHC Act, in other words, 70 percent of the assets of the bank holding company must consist of one or more savings banks at the time of formation.

Insurance activities of any qualified savings bank which is a subsidiary of a bank holding company are limited to the insurance activities allowed under section 4(c)(8) of the BHC Act. A qualified savings bank that was authorized to engage in the sale or underwriting of savings bank life insurance, as of March 5, 1987, can sell or underwrite such insurance directly, provided that it is permitted to underwrite and engage in the sale of savings bank life insurance as that activity is authorized for savings banks by state law, and is located in Massachusetts, Connecticut, or New York. Should the bank holding company parent of the qualified savings bank cease to be a savings bank holding company, the savings bank must cease engaging in these activities within two years.

In a separate application a nonoperating company, which was formed for the purpose of acquiring a savings bank, insured by the Federal Deposit Insurance Corporation, applied for the Board’s approval to become a bank holding company pursuant to section 3(a)(1) of the Bank Holding Company Act, acquiring all of the voting shares of the savings bank. The savings bank engages through subsidiaries in real estate investment and development activities authorized pursuant to State law.

As part of the Board’s analysis in this case, including its evaluation of the capital and financial resources of the bank holding company and the bank involved, the Board considered the risk to the Applicant and to the savings bank of the real estate development activities to be conducted by the savings bank through its nonbank subsidiaries. The Board expressed serious reservations with regard to this application and similar applications by bank holding companies to acquire savings banks engaged directly or through subsidiaries in real estate development activities. In the Board’s view the conduct of real estate development activities through a holding company subsidiary rather than a bank subsidiary would provide more effective corporate separateness.

The Board approved the application by Order on October 30, 1987 (1987 FRB 925), relying on the Applicant’s commitments.

3010.0.1 INTRODUCTION

The prohibitions against a bank holding company having or acquiring nonbank interests do not apply to bank holding companies meeting the requirements of section 4(c)(i) and (ii) of the Act.

3010.0.2 LABOR, AGRICULTURAL OR HORTICULTURAL ORGANIZATIONS

Section 4(c)(i)—‘‘Any company that was on January 4, 1977, both a bank holding company and a labor, agricultural or horticultural organization exempt from taxation under section 501 of the Internal Revenue Code of 1954, or . . . any labor, agricultural or horticultural organization to which all or substantially all of the assets of such company are hereafter transferred.’’

Exemption under this section was amended when the Financial Institutions Regulatory and Interest Rate Control Act of 1978 became effective early in 1979. The effect of the amendment was to repeal exemption under this section for labor, agricultural or horticultural organizations becoming BHCs after *January 4, 1977*, except for those organizations becoming BHCs by means of acquiring all or substantially all of the assets of a company that was both a BHC and a labor, agricultural or horticultural oganization exempt from taxation on January 4, 1977. In order for a holding company to be entitled to this exemption, net income derived from the organization cannot inure to the benefit of any individual. Organizations must be formed primarily for the betterment of the working conditions of the labor organization's members, or improvement in the grade of agricultural or horticultural products for an agricultural or horticultural organization. The growing of products for profit by agricultural or horticultural organizations would disqualify them for exemption. Thus the phrase ‘‘any labor, agricultural or horticultural organization’’ is intended to include only such organizations that are also exempt from taxation under section 501 of the Internal Revenue Code of 1954.

In order for a labor, agricultural or horticultural organization to receive exemption from taxation under section 501(c)(5) of the Internal Revenue Code of 1954, it must file an application (form 1024) with the IRS. In response to the application, the organization receives a determination letter which should be reviewed to assure that exemption was allowed and to verify the date the company became exempt under section 501. The date of exemption is determined as follows. A company which files for exemption within 18 months after its organization is considered exempt as of the date of its organization. The date of IRS approval is the date of exemption if application for exemption is filed more than 18 months after organization. The date of exemption must be no later than January 4, 1977, for the company to be entitled to exemption from section 4 of the Act. The fact that an organization pays income taxes annually does not disallow its exemption under section 501 of the tax code. Despite its tax exemption, an organization is subject to tax on its unrelated business income.

3010.0.3 FAMILY-OWNED COMPANIES

Section 4(c)(ii)—‘‘A company covered in 1970 more than 85 percentum of the voting stock of which was collectively owned on June 30, 1968, and continuously thereafter, directly or indirectly, by or for members of the same family, or their spouses, who are lineal descendants of common ancestors.’’

The phrase ‘‘voting stock’’ does not limit the form of an organization to an incorporated entity. Exemption under this section extends to other forms of business associations which meet the definition of a company. For example, for a partnership, the 85 percent rule applies to ‘‘general partnership interest’’ and for a trust which meets the definition of a company, the 85 percent rule applies to ‘‘beneficial ownership.’’ A company must continue to control the same subsidiary bank that it controlled on June 30, 1968, to retain its exemption under this section. Lineal descendants of common ancestors include descendants by half as well as full blood and legally adopted children.

In January 1980, the Board approved an application of a one-bank holding company covered by the exemption in 4(c)(ii) to acquire an additional bank, but stated that the holding company could no longer rely on that section for conducting its nonbanking activities. Based upon its review of the legislative intent of Congress in providing this exemption, it was the Board's judgment that the exceptionally broad exemption afforded by section 4(c)(ii) must be limited to family-owned one-bank holding companies that are not engaged in the management of banks. Moreover, in the Board's view, upon the acquisition of an additional bank, a one-bank holding company that is exempt under section 4(c)(ii) of the Act, would become engaged in the management of banks, and would thereby terminate its eligibility for the exemption. In addition, the Board believed that to permit unsupervised nonbank expansion by a multibank holding company would constitute an evasion of the Act, which the Board is authorized to prevent pursuant to section 5(b) of the Act.

3010.0.4 INSPECTION OBJECTIVES

1. To verify that a holding company qualifies for exemption from the prohibitions of section 4 by virtue of either section 4(c)(i) or 4(c)(ii).
2. Review the activities conducted by a company qualifying for an exemption under section 4(c)(ii) of the BHC Act, which may be faced with revocation of the exemption, and determine if there may be eligibility for permanent grandfathering under section 4(a)(2) of the BHC Act.

3010.0.5 INSPECTION PROCEDURES

1. Although bank holding companies qualifying for a section 4(c)(i) or 4(c)(ii) exemption are not routinely inspected on a periodic basis, when inspected their exempt status should be verified. All nonbank activities of exempt organizations should be examined in the inspection. The nature of all such activities and the dates they were commenced should be documented in the work papers to establish their current permissibility in the event the organization should lose its exemption from section 4.
2. For BHCs exempt under section 4(c)(i), the examiner should ascertain the date the company became exempt under section 501 of the tax code. Also, the stock books of the subsidiary bank or other pertinent documents should be reviewed to assure that the company was a BHC on January 4, 1977.
3. When verifying a company's exemption under section 4(c)(ii), the stock records of the subsidiary bank and the stock records, partnership agreements, trust agreements and other records of the bank holding company should be reviewed to assure that the following conditions have been satisfied:
    a. 25 percent or more of the voting stock of the subsidiary bank has been continuously owned by the BHC since June 30, 1968;
    b. Members of the same family have continuously held an 85 percent or more interest in the holding company since June 30, 1968.

3010.0.6 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Acquisition of an additional bank by a company exempt under 4(c)(ii)				1980 FRB 165
"Successor" to a Company Exempt under 4(c)(ii)				1980 FRB 349

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Section 4(c)(1) of the BHC Act (Investment in Companies Whose Activities are Incidental to Banking) Section 3020.0

3020.0.1 INTRODUCTION

By virtue of section 4(c)(1) of the Act, a bank holding company may invest, without supervisory approval, in the shares of companies engaged in activities that Congress felt were incidental to the business of banking. The following activities are permissible investments for bank holding companies under this section.

3020.0.2 PROVIDING BANKING QUARTERS

Section 4(c)(1)(A) provides that a BHC may invest in a company engaged in holding or operating properties used wholly or substantially by any banking subsidiary of such bank holding company in the operations of such banking subsidiary or acquired for such future use.

Normally, bank utilization of 50 percent or more of the property would meet the requirements of this section. Investments in property where usage of such property by subsidiary banks is less than 50 percent will be reviewed on an *ad hoc* basis to determine its permissibility under this section. Future needs of the bank holding company and its bank subsidiaries will be considered when reviewing these cases.

In acquiring property, a bank holding company must have definite plans for use of the property as a subsidiary bank's premises within a reasonable period of time. Property may not be acquired and indefinitely warehoused until a need develops for the property.

This section of the BHC Act does not provide the authority for a BHC to invest in the shares of a company engaged in holding or operating properties used by nonbank subsidiaries. Directly holding or operating properties used by a nonbank subsidiary is considered an incidental activity necessary to carry on the main business activity of the subsidiary and thus is exempt under section 4(a)(2)(A) of the Act and section 225.22(a)(2)(vi) of Regulation Y.

3020.0.3 SAFE DEPOSIT BUSINESS

Section 4(c)(1)(B) of the Act provides that a holding company may invest in the shares of a company whose activities are limited to conducting a safe deposit business. Refer to Section 225.22(b) of Regulation Y.

3020.0.4 FURNISHING SERVICES TO BANKING SUBSIDIARIES

Section 4(c)(1)(C) of the BHC Act provides that a BHC may invest in a company which furnishes services to or performs services for the bank holding company or its banking subsidiaries. Section 225.22(a) of Regulation Y provides that a bank holding company may, without the Board's prior approval, furnish services to or perform services for its banking and nonbanking subsidiaries either directly or indirectly through a subsidiary. Generally, a BHC may only provide services related to the internal operations of the BHC or its subsidiaries. A bank holding company or its subsidiaries may not rely on the servicing exemption to deal with the public as principal, but may deal with outside parties provided they are acting only as agent for the holding company or its subsidiaries.

The term "services" implies servicing operations a bank may carry on itself, but which the BHC chooses to have done through a nonbank subsidiary. Section 225.22(a)(2) states that services for the internal operations of the bank holding company or its subsidiaries include: accounting, auditing, appraising, advertising, public relations, data processing, data transmission services, data bases or facilities, personnel services, courier services, holding or operating property used wholly or substantially by a subsidiary in its operations or for its future use, and selling, purchasing or underwriting insurance such as blanket bond insurance, group insurance for employees, and property and casualty insurance. For the later insurance activities, bank holding companies are permitted under the servicing exemption to act as agent or to underwrite insurance on their own risks (e.g. blanket bond insurance or employee group insurance plans). Refer to section 225.22(a)(2) of Regulation Y for other services permissible for the internal operations of the BHC or its subsidiaries.

The servicing exemption extends to services that are normally performed by a bank for its customers or correspondent banks. These activities generally include computerized billing, payroll, accounting, financial records maintenance and other similar data processing services as long as the subsidiary bank is permitted under applicable State or federal law to provide the service. These services may be provided only upon request by the customers to the subsidiary bank. Furthermore, the contractual arrangements must be made between the customer and the bank. The company can service existing service contracts the bank has originated but is prohibited from purchasing the contracts or entering into contracts to provide services directly to the public.

The purchasing of participations by the parent in loans from subsidiary banks generally is not considered an exempt activity under the authority of sections 4(a)(2) or 4(c)(1). Holding companies that engage in the purchase of participations from their subsidiary banks should file an application pursuant to Section 4(c)(8) of the BHC Act. Purchasing participations in loans for the purpose of providing liquidity or acquiring a portion of a line of credit to facilitate the needs of the bank's customers (overlines) provides a service or benefit to the bank and is considered an acceptable purchase under the services exemption. In all cases where a participation in a loan is purchased, the loan must be made in the name of the bank and serviced by the respective bank. The purchasing of a loan for reasons other than those set forth above may be viewed as a direct lending activity.

3020.0.5 FURNISHING SERVICES TO NONBANK SUBSIDIARIES

The Bank Holding Company Act of 1956 prohibited a BHC itself from engaging in any business except (1) banking, (2) managing or controlling banks, and (3) furnishing services to its bank subsidiaries. In 1970, Congress amended section 4 of the BHC Act to expressly authorize a BHC to furnish services to or perform services for its nonbank subsidiaries as well as its bank subsidiaries under exemption A of section 4(a)(2). While section 4(c)(1) authorizes a BHC to invest in shares of a company engaged in certain activities, exemption A provides the authority for a BHC to engage in those activities directly.

The Board issued an interpretation (12 C.F.R. 225.141), effective August 1980, which stated that it will permit, without any regulatory approval, a bank holding company to form a wholly-owned subsidiary to perform servicing activities for both banking and nonbanking subsidiaries that the holding company itself could perform directly or through a department or a division under section 4(a)(2)(A) of the BHC Act. In addition, an approved section 4(c)(8) company may form a wholly-owned subsidiary to engage in activities that such company could itself engage in.

3020.0.6 LIQUIDATING ASSETS

Section 4(c)(1)(D) provides that a BHC may own shares of a company which engages in liquidating assets acquired from such BHC (not including its nonbank subsidiaries) or its banking subsidiaries or which were acquired from any other source prior to May 9, 1956, or the date on which such company became a BHC, whichever is later.

Assets acquired for liquidation by a section 4(c)(1)(D) subsidiary are subject to the same time limitations as shares acquired D.P.C. pursuant to section 4(c)(2) of the Act.

BHCs seeking to hold the shares of a liquidating or nominee subsidiary organized to dispose of assets acquired D.P.C. by a BHC nonbank subsidiary, can rely on the Board's August 1980 interpretation permitting, without prior regulatory approval, a BHC to form a subsidiary to perform activities which itself could perform under exemption A of section 4(a)(2).

3020.0.7 INSPECTION OBJECTIVES

1. To determine whether the activities conducted by companies in which the BHC has a greater than 5 percent investment in the company and for which the BHC claims exemption under section 4(c)(1) of the BHC Act, are the types of permissible activities contemplated by that section—activities claimed under the premises exemption under 4(c)(1)(A), the safe deposit business exemption under 4(c)(1)(B), the services exemption under (4)(c)(1)(C), or the liquidating subsidiary exemption (4)(c)(1)(D).

3020.0.8 INSPECTION PROCEDURES

The inspection of a nonbank subsidiary exempt under section 4(c)(1) of the Act should center on a review of the activities to assure that those activities are the types permissible under section 4(c)(1) subsections A, B, C and D.

3020.0.8.1 Section 4(c)(1)(A)—Bank Premises

The following procedural steps should be performed in connection with an inspection of a bank premises company.

1. Obtain a list of all real estate held by the company including the following information:
   a. Property description and location;
   b. Date acquired;
   c. Current utilization;
   d. Extent of utilization by banking subsidiaries and others indicating percentage of square feet leased to subsidiaries.
2. When use of the property by a subsidiary bank(s) is less than 50 percent, discuss future plans for the use of the property with management. Note any related discussion contained in the minutes of directors' and committee meetings, and action taken to date to implement these plans. Lease agreements with other tenants should be reviewed to determine the term of a lease including options to renew.
3. Evaluate the permissibility of holding each property under the premises exemption.
4. Review and evaluate other activities engaged in and assets held by the company to establish their permissibility under the premises exemption. Such activities could include leasing property and providing a general maintenance service to other tenants.

3020.0.8.2 Section 4(c)(1)(B)—Safe Deposit Business

Activities exempt under this section are restricted to conducting a safe deposit business. All activities engaged in and assets held by companies for which the BHC is claiming exemption under this section should be reviewed and evaluated to determine their permissibility under this exception.

3020.0.8.3 Section 4(c)(1)(C)—Services

The following procedural steps should be performed when inspecting service companies.

1. List and describe all services provided to subsidiaries in the inspection report.
2. Review and evaluate the types of services provided to the banking and nonbanking subsidiaries to determine their permissibility.
3. Obtain from management any written bank holding company policies concerning the provision of services and the assessment of fees or discuss with management the basis on which service fees are established.
4. Comment on the reasonableness of fees relative to the fair market value, cost, volume, or quality of such services rendered.
5. Indicate if all service contracts have been approved by each subsidiary's board of directors.
6. When reviewing services provided to banking subsidiaries for their customers:
   a. List and describe all services provided;
   b. Determine that the company is operating as an adjunct to its affiliated banks for the purpose of facilitating the bank's operations, and not as a separate, self-contained organization;
   c. Review contractual arrangements to assure that the company has not purchased any service contracts from a subsidiary bank and has not entered directly into agreements to provide services to any party other than the bank;
   d. Review and evaluate all services to determine whether they are services that the subsidiary bank is permitted to provide under applicable State or federal law.

3020.0.8.4 Section 4(c)(1)(D)—Liquidating Subsidiary

The following procedural steps should be followed in connection with an inspection of a liquidation company in which the BHC holds an investment.

1. Obtain a list of all assets acquired by the company for the purpose of liquidation including the following information:
   a. Asset description and location;
   b. Date acquired;
   c. Source of acquisition;
   d. Liquidation plans, including timetable and selling price;
   e. Cost of assets and book value, including detail on any improvements.
2. Verify that assets acquired from sources other than the parent or its subsidiary banks were acquired prior to May 9, 1956, or the date on which the holding company became a BHC, whichever is later.
3. Verify that assets acquired for liquidation did not originate in a nonbank subsidiary. If a section 4(c)(1)(D) liquidating subsidiary is holding a material amount of assets acquired from a nonbank subsidiary, discuss the propriety of these holdings with the Reserve Bank office staff and, if necessary, Board staff in the Division of Banking Supervision and Regulation or the Legal Division.
4. Review the bank holding company's policies, practices and procedures concerning the liquidation of assets and determine if the subsidiary is in compliance with the time limits indicated above.
5. Discuss with management and note the

liquidation plans and progress to date in liquidating assets that have been held in excess of 12 months. Note any related discussion found in the minutes of directors' and committee meetings.

6. Comment on whether management is making a *bona fide* effort to dispose of all assets for fair value.

7. Check improvements made to property by the company to assure that the nature and use of the asset has not substantially changed. The investment of funds to change substantially the nature of the asset (such as undeveloped real estate) to increase its value would generally be viewed as engaging in real estate development, an activity which is not permissible.

3. Federal Reserve Regulatory Service reference.

Section 4(c)(2) of the Bank Holding Company Act permits a bank holding company or any of its subsidiaries to acquire shares in satisfaction of debts previously contracted (DPC) in good faith. The shares must be disposed of within two years from the date they were acquired, except that the Board is authorized upon application of a company to grant additional exemptions if, in its judgment, the extension would not be detrimental to the public interest and either the bank holding company has made a good faith attempt to dispose of those shares during the five-year period, or the disposal of the shares would have been detrimental to the company. The aggregate duration of the extensions cannot extend beyond 10 years.

Even though the statute refers specifically to shares, the Board has taken the position, in section 225.22(d) of its Regulation Y and in an interpretation (12 C.F.R. 225.140), that the congressional policy evidenced by section 4(c)(2) should apply to DPC acquisitions of other assets, other than shares (assets), and real estate by bank holding companies and their nonbanking subsidiaries. Section 225.22(d)(1) provides the same holding periods (including provision for extensions) for other DPC assets or real estate as are provided by statute for DPC shares.

Regulation Y, section 225.22(d), addresses nonbanking acquisitions that do not require prior Board approval. With respect to DPC acquisitions, voting securities, or other assets or real estate acquired by foreclosure or otherwise, in the ordinary course of collection of a debt previously contracted (DPC property) in good faith, Regulation Y does not require the Board's prior approval if the DPC property is divested within two years of acquisition. Regulation Y further states that the Board may, upon request, extend the two-year period for up to three additional years. Further, the Board may permit additional extensions for up to five years (for a total of 10 years). This provision applies to shares, real estate, or other assets in which the holding company demonstrates that each extension would not be detrimental to the public interest and either the bank holding company has made good faith attempts to dispose of such shares, real estate, or other assets, or the disposal of the shares, real estate, or others assets during the initial period would have been detrimental to the company. Transfers within the bank holding company system do not extend any period for divestiture of the property.

Under the Board's delegated authority, the Reserve Banks may approve a BHC's requests for extensions beyond the two-year divestiture period.[1] In accordance with a Board interpretation (12 C.F.R. 225.138), extensions should not be granted except under compelling circumstances, and periodic progress reports on divestiture plans are generally required. When these permissible extension periods expire, the Board no longer has discretion to grant further extensions. A BHC would be in violation of the act if shares, other assets, or real estate acquired DPC is not disposed of within the prescribed time frame.

In July 1980, the Board issued an interpretation of Regulation Y (12 C.F.R. 225.140) that provided for a possible approval for an additional five-year period for the divestiture of real estate acquired DPC. With respect to DPC real estate, this interpretation requires that (1) the value of the real estate on the books of the company be written down to fair market value, (2) the carrying costs cannot be significant in relation to the overall financial position of the company, and (3) the company must make good faith efforts to effect divestiture. Fair market value should be derived from appraisals, comparable sales, or some other reasonable method. Companies holding real estate for this extended period are expected to make active efforts to dispose of it, and they should advise the Reserve Bank regularly concerning their ongoing efforts.

In accordance with the Board's interpretation (12 C.F.R. 225.140), after two years from the date of acquisition of DPC assets, the holding company is to report annually to the Federal Reserve on its efforts to accomplish divestiture of the assets. The Reserve Bank will monitor the efforts of the company to effect an orderly divestiture. Divestiture may be ordered before the end of the authorized holding period (beyond the initial two-year period that requires no Board authorization) if supervisory concerns warrant such action.

Section 4(c)(1)(D) allows a bank holding company to establish a subsidiary to hold real estate acquired by itself or by any of its banking subsidiaries for debts previously contracted, for the purpose of disposing of the real estate in an orderly manner. Permissible activities of this

1. Each Federal Reserve Bank has been delegated the authority (12 C.F.R. 265.2(f)(12)) to extend the time within which a bank holding company or any of its subsidiaries must divest itself of interests acquired in satisfaction of a debt previously contracted.

liquidating subsidiary include completion of a real estate development project and other activities necessary to make the real estate saleable. The ''date of acquisition'' is the date the bank holding company (or subsidiary of the bank holding company) acquired the DPC asset. Section 4(c)(1)(D) may not be used to extend the time under which a bank holding company may indirectly hold DPC property under section 4(c)(2). In most cases where a subsidiary bank has held property for the statutory holding period, a BHC may not shift the property to another subsidiary or to the parent to avoid disposing of the property. However, due to the complexity and potential impact on the organization of a forced divestment at the end of the holding period, inspection personnel and Reserve Bank staff are encouraged to discuss the situation with Board staff to tailor the supervisory response to the particular situation.

With respect to the transfer by a subsidiary of other DPC shares, other assets, or real estate to another company in the holding company system, including a section 4(c)(1)(D) liquidating subsidiary, or to the holding company itself, such transfers would not alter the original divestiture period applicable to such shares or assets at the time of their acquisition. Moreover, to ensure that assets are not carried at inflated values for extended periods of time, the Board expects, in the case of all such intercompany transfers, that the shares or assets will be transferred at a value no greater than the fair market value at the time of transfer and that the transfer will be made in a normal arm's-length transaction. With regard to DPC assets (except for DPC shares as described above) acquired by a banking subsidiary of a holding company, as long as the assets continue to be held by the bank itself, the Board will regard them as being solely within the authority of the primary supervisor of the bank.

Section 4(c)(3) of the Bank Holding Company Act permits a bank holding company to acquire shares or real estate from any of its subsidiaries if a subsidiary had been requested to dispose of the shares by any federal or state authority having power to examine the respective subsidiary. The Board does not have authority to extend the two-year disposition period under section 4(c)(3) of the act. Section 4(c)(3) may not be used to extend the statutory period in which a bank must dispose of DPC assets (10 years in the case of DPC real estate assets, five years for all other).

3030.0.1 EXEMPTION TO SECTION 4(c)(2) DISPOSITION REQUIREMENTS OF DPC SHARES

Section 4(c)(5) of the Bank Holding Company Act allows a bank to own shares in certain nonbanking companies, specifically, the kinds and amounts eligible for investment by national banking associations under the provisions of section 5136 of the Revised Statutes (see section 3050.0 for a detailed explanation of section 4(c)(5)). The exemption provided by section 4(c)(5) covers any shares, including shares acquired DPC, that meet the conditions set forth in that exemption. Therefore, DPC shares held by a banking subsidiary of a bank holding company which meet section 4(c)(5) conditions are not subject to the disposition requirement prescribed in section 4(c)(2); however, such shares would continue to be subject to requirements for disposition as may be prescribed by provisions of any other applicable banking laws or by the appropriate bank supervisory authorities.

Section 4(c)(6) of the act allows a bank holding company to own shares, including those acquired DPC, of any nonbank company that does not exceed 5 percent of the outstanding voting shares of such company. The Board has expressed an opinion (12 C.F.R. 225.101(f)) that any shares acquired DPC under this section, whether by a holding company or a bank subsidiary, are not subject to the disposition requirements of section 4(c)(2) of the act.

Real property is often shown on an entity's books as other real estate (ORE). Possession of ORE usually results from a distressed loan collateralized by a lien on real estate. In addition, in attempting to salvage other types of credit, an entity may have obtained title to real property through process of law or by voluntary deed. Acquisition costs for other real estate acquired for debts previously contracted usually consist of the principal amount that was due on the defaulted loan at the time the entity took possession, unpaid interest, legal fees and other foreclosure costs, accrued and unpaid taxes, and mechanic's liens. Property acquired DPC may be recorded on the company's books by capitalizing the loan amount and acquisition costs. Advances to complete the project can be included in the capitalized investment if the ORE is an unfinished project. The fact that the additional investment is being used to improve the property and make the property more saleable should be evident.

A company owning a DPC asset should maintain records documenting its efforts to dispose of the asset. Because an ORE asset is normally a nonliquid, nonproductive asset of uncertain value, a company should attempt to dispose of the asset at the earliest date possible. Unless special circumstances are present, a company should sell the ORE asset when a price offer sufficient to cover the acquisition, investment, and carrying costs is obtained.

3030.0.2 INSPECTION OBJECTIVES

1. To determine compliance with applicable laws, rulings, and regulations, and to initiate corrective action when violations appear in these areas.

2. To determine whether policies, practices, and internal controls regarding DPC shares, other assets, or real estate are adequate and to recommend correction when deficiencies are noted.

3. To evaluate the quality of DPC shares, other assets, or real estate and the progress toward their disposition.

4. To determine whether the DPC shares, other assets, or real estate acquired are recorded at fair market value.

3030.0.3 INSPECTION PROCEDURES

1. During the preinspection review, compile a list of shares, other assets, and real estate known to have been acquired DPC by the bank holding company and its nonbank subsidiaries, as well as a list of shares known to have been acquired DPC by the BHC's bank subsidiaries. Information on this list should include—

   a. a description of the shares or asset(s);

   b. the fair market value of the shares and asset(s), and the method of valuation, if available;

   c. the name of the company owning the shares and asset(s); and

   d. the date the shares and asset(s) were acquired.

2. If the shares or asset has been held longer than the initial holding period, determine whether the BHC has requested an extension of time.

3. In the Officer's Questionnaire, request a list of DPC shares, other assets, or real estate owned by the holding company and its nonbanking subsidiaries, and a list of DPC shares owned by the holding company's bank subsidiaries, including a detailed description of the shares or asset, the value of the shares or asset on the entity's books, the date the shares or asset was acquired, and plans for disposal of the shares or asset. In addition, a list of DPC shares, other assets, or real estate which has been disposed of since the previous inspection or within the past year should be obtained. Compare these lists with the list compiled during the preinspection review.

4. Review other real estate owned accounts to evaluate—

   a. the fair market value of the property (A qualified appraiser should appraise the property at the time of acquisition, and subsequent timely appraisals should be conducted to determine the current fair market value of the property.);

   b. the carrying costs of the property; and

   c. the company's efforts to dispose of the property (Information on file should include documentation showing a record of offers made by potential buyers and other information reflecting efforts to sell the property (i.e., advertisement brochures)).

5. Determine whether additional advances have been made on an unfinished project and whether evidence supports that the advances are making the property more saleable.

6. Determine whether a first-lien status exists and whether there are any tax liens or other encumbrances against the property.

7. Discuss DPC shares, other assets, or real estate and their values with management who is familiar with the history and current status of the shares or asset and assign classification, if warranted. A substandard classification may be applied when a company is sustaining losses in maintaining the property, and prospects for sale are not evident or encouraging. A company's acquisition of property through foreclosure often indicates a lack of demand and, as time elapses, the value of the real estate may become more questionable if the lack of demand persists. If the carrying amount of the investment exceeds the estimated value of the property, an adequate allowance reserve for any difference should be established and maintained. Property that is in the process of being sold for an amount in excess of the carrying value should not be classified if it appears that ultimate payment will be forthcoming.

8. List shares, other assets, and real estate acquired DPC under ''other assets'' in the inspection report. For significant shares and assets, the examiner may choose to present in the inspection report or in the workpapers, whichever is deemed appropriate, the following information:

a. a brief description sufficient to identify the property, the manner in which the property was acquired, and the reasons for its acquisition

b. the value of the shares or assets on the books of the company, the method used to determine the booked value, and whether it is the fair market value

c. a brief statement as to management's efforts to sell the property, its opinion of the likelihood of sale, and the anticipated sales price

d. a summary of the carrying costs subsequent to assumption and income generated from the property

e. the date when the holding company or its subsidiary must dispose of the property or request an extension to continue to hold the DPC shares or asset

f. the amount classified, if appropriate

g. any apparent discrepancies with rules or regulations

3030.0.4 Laws, Regulations, Interpretations, and Orders

3. *Federal Reserve Regulatory Service* reference.

Section 4(c)(4) of the Bank Holding Company Act provides that nonbank shares held or acquired by a bank in good faith in a fiduciary capacity are exempt from the general prohibitions of section 4 of the Act. This exemption is provided to allow banks to carry on their normal fiduciary operations without significant interference and without being subject to the limitations of the Bank Holding Company Act. Without this exemption, a subsidiary bank could act as trustee for up to only 5 percent of a nonbank company's shares as provided by section 4(c)(6) of the Act.

There are certain exceptions which were included within the body of the section 4(c)(4) exemption to prevent utilization of the trust vehicle to circumvent the intent of the Act. The section 4(c)(4) exemption is not applicable when shares acquired are held by a trust which is considered a "company" under section 2(b) of the Act. Under section 2(b), a trust is defined as a company if it does not terminate within 25 years, or within 21 years and 10 months after the death of individuals living on the effective date of the trust. Such trusts are generally referred to as perpetual trusts and include employee benefits and charitable trusts which can operate in perpetuity.

Another exception to the exemption implies that no more than 5 percent of the shares of a nonbank company may be held by a subsidiary bank as trustee under a trust established for the benefit of the bank itself, the bank's parent company or any of its subsidiaries, or the shareholders or employees of the bank, the parent company or its subsidiaries as indicated in section 2(g)(2) of the Act. Employee benefit trusts have become a principal source of banks' trust assets. As strictly applied, section 4(c)(4) would limit acquisition of stock of a nonbank company to 5 percent of its shares for employee trust accounts of banks which are subsidiaries of bank holding companies.

3040.0.1 TRANSFER OF SHARES TO A TRUSTEE

Section 2(g)(3) of the Act is tied to section 4(c)(4) by specific reference as an exception to the fiduciary exemption. Section 2(g)(3) provides that shares transferred by a bank holding company to a transferee are deemed to continue to be controlled by the bank holding company if the transferee is indebted to the bank holding company or has one or more officers, directors, trustees or beneficiaries in common with or subject to control by the holding company. However, the Board may determine after opportunity for hearing in such cases that control does not exist.

Relating this to section 4(c)(4), if a bank holding company transfers nonbank shares to a trustee where the trustee has one or more directors in common with the bank holding company, the nonbank shares are deemed to be controlled by the bank holding company until the Board determines otherwise.

3040.0.2 TRUST COMPANY SUBSIDIARIES

Even though section 4(c)(4) refers by its language to shares held or acquired by a *bank* in good faith in a fiduciary capacity, the exemption also applies to shares held or acquired in a fiduciary capacity by a trust company subsidiary of a bank holding company.

3040.0.3 OTHER REPORTING REQUIREMENTS

Holdings in fiduciary capacities of nonbank stock over 5 percent in certain circumstances, may also trigger reporting requirements under the federal securities laws.

3040.0.4 INSPECTION OBJECTIVES

To determine that nonbank shares held by a bank in a fiduciary capacity are in compliance with section 4(c)(4).

3040.0.5 INSPECTION PROCEDURES

Review the holding company's internal reporting procedures to establish that bank trust departments report 5 percent holdings in nonbank companies. In multibank companies, determine that controls are in place to aggregate nonbank shares held by each bank so that if an aggregate of 5 percent is held, it is reported in the Y–6.

3040.0.6 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Interests In Nonbanking Organizations		225.12(a) 225.22(c)(3)		

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Section 4(c)(5) of the Bank Holding Company Act permits (without prior approval) investments by a bank holding company in shares of the kinds and amounts eligible for investment by national banks under the provisions of section 5136 of the Revised Statutes (12 U.S.C. 24(7)).

National banks are prohibited by section 5136 of the Revised Statutes from purchasing and holding shares of any corporation except those corporations whose shares are specifically made eligible by federal statute. This prohibition is made applicable to State member banks by section 9, paragraph 20 of the Federal Reserve Act (12 U.S.C. 335).

In 1968, the Board interpreted section 5136 as permitting a member bank to purchase shares of a corporation engaging in business (at locations the bank is authorized to engage in business) and carrying out functions the bank is empowered to perform directly. Section 5136 is a broad statute with types of permissible activities both explicitly defined and implied indirectly without express definition. Therefore, to limit the need for constant Board interpretation regarding the implied areas of section 5136, the Board curtailed the authority of a bank holding company to acquire shares on the basis of section 4(c)(5) through section 225.22(d) of Regulation Y. As a result, effective June 30, 1971, permissible shares for bank holding company acquisition under section 4(c)(5) are limited to those *explicitly* authorized by any federal statute. Additional reasons for limiting the scope of activities to those explicitly defined by statute, are that section 4(c)(5) acquisitions require neither prior Board approval, nor the opportunity for interested parties to express their views, nor any prior regulatory consideration of anti-trust and related matters.

3050.0.1 COMPANIES IN WHICH BHC'S MAY INVEST

The following is a list of permissible companies expressly authorized by federal statute. The list includes the companies most frequently encountered.

1. Small business investment companies ("SBICs").
2. Agriculture credit companies.
3. Edge and agreement corporations.
4. Bank premises companies (usually exempt under section 4(c)(1)(A)).
5. Bank service corporations (usually exempt under section 4(c)(1)(C)).
6. Safe deposit companies.
7. Obligations of student loan marketing associations.
8. State housing corporations.

3050.0.2 LIMITATIONS

On most 5136 authorizations, share investments are limited in some form, usually based on a percentage of the bank's capital and surplus. Under section 4(c)(5), a holding company's investment in such shares is also limited by amount and type to those permitted for a national bank to prevent avoidance of these limitations by a bank holding company.

3050.0.3 INSPECTION OBJECTIVES

1. To determine the permissibility of each activity encountered during the inspection which claims a section 4(c)(5) exemption.
2. To determine if the operations and financing of the section 4(c)(5) activity is not to the detriment of the bank(s).

3050.0.4 INSPECTION PROCEDURES

1. Review compliance with section 5136 of the Revised Statutes to determine if the activity is expressly permitted by any federal statute.
2. Determine the financial condition of the activity and its impact on the bank affiliate.

3050.0.5 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

3060.0.1 SECTION 4(c)(6)

This section provides an exemption for ownership of shares of any nonbank company that do not exceed 5 percent of the outstanding voting shares of such company. The exemption is designed to permit diversification of investments by a bank holding company and its subsidiaries which do not result in control of a nonbanking organization. The Board has indicated through an interpretation of 12 U.S.C. 225.101, that in its opinion, the 5 percent limitation applies to the aggregate amount of voting stock in a particular nonbank company held by the entire bank holding company organization including the parent company and all of its direct and indirect bank and nonbank subsidiaries. This is to prevent a holding company from acquiring a controlling interest in a nonbank company through ownership of small blocks of stock by numerous subsidiaries in circumvention of the provisions of section 4 of the BHC Act.

3060.0.1.1 D.P.C. Shares

The same interpretation (12 C.F.R. 225.101) also addresses the question of the applicability of section 4(c)(6) to nonbank shares acquired in satisfaction of debts previously contracted (D.P.C.) by a subsidiary bank, any nonbank subsidiaries, or the parent company. In this instance, the Board expressed the opinion that the 5 percent exemption provided by section 4(c)(6) covers any nonbank shares, including those acquired D.P.C. Consequently, shares which meet such conditions are not subject to the disposition requirements of section 4(c)(2) of the Act. It is important to remember that the exemption provided by section 4(c)(6) applies only to shares of any nonbank company. Acquisitions of any bank shares are subject to the provisions contained in section 3(a) of the Act.

Although the 5 percent limitation of this section applies, by its language, to "voting shares" rather than "any class of voting shares" as used elsewhere in the Act, the Board has indicated in 12 C.F.R. 225.137 that it applies to "any class of voting shares" rather than to the aggregate of all classes of voting shares held. Thus section 4(c)(6) is not available to a group of BHCs each owning a "class of voting securities" even if each BHC owns less than 5 percent of all shares outstanding. Further, section 4(c)(6) must be viewed as permitting ownership of 5 percent of a company's voting stock only when that ownership does not constitute "control" as otherwise defined in section 2 of the Act.

Note that section 4 prohibits engaging in nonbank activities other than those permitted by section 4(c)(8). Thus, if a BHC may be deemed to be "engaging in an activity" through the medium of a company in which it owns less than 5 percent of the voting stock it may nevertheless require Board approval, despite the section 4(c)(6) exemption.

3060.0.1.2 Acquisition of Nonbank Interests—Royalties as Compensation

A bank holding company requested an opinion on the permissibility of its subsidiary's receiving limited overriding royalty interests in oil, gas, and other hydrocarbon leasehold interests as partial compensation for investment advisory services in connection with those properties. The bank holding company was not acquiring more than 5 percent interest in any project. The subsidiary was to place the assigned royalties in a compensation plan for assignment to certain professional employees. Neither the subsidiary nor any affiliate were to acquire, hold, locate, sponsor, develop, organize, or manage any other energy property investment or in any other manner control the investment. The subsidiary was to hold interest in energy properties only if the interest had not yet been reassigned to an employee, or if an employee terminates service with the subsidiary and is required to reassign his or her energy properties to the subsidiary. The bank holding company's proposal was consistent with section 4(c)(6) of the Bank Holding Company Act, which exempts passive investments of 5 percent or less from the prohibitions of section 4 of the Bank Holding Company Act.

3060.0.2 SECTION 4(c)(7)

This section provides bank holding companies the opportunity to own, directly or indirectly, shares of an investment company (any amount up to 100 percent of outstanding shares) provided that each of the following conditions is met:

1. The investment company is not itself a bank holding company;
2. The investment company is not engaged in

any business other than investing in securities; and

3. Securities in which the investment company invests do not include more than 5 percent of the outstanding voting securities of any company.

4. As in section 4(c)(6), the 5 percent limitation applies, by its language, to "voting shares" rather than "any class of voting shares," as used elsewhere in the Act. However, the criterion applies to "any class of voting shares" for purposes of this section.

The 5 percent restriction does not prevent an investment company from having direct or indirect subsidiaries of its own, provided that ownership of such subsidiaries is permitted under another provision of the Act. Rather, the limitation is intended to apply only to securities purchased in the ordinary course of investing by the investment company.

The legislative history of this provision of the Act does not provide a clear indication as to the type of institutions encompassed under the term "investment company" as used in this section. It appears, however, that any company primarily engaged in the purchasing and ownership of securities may be regarded as an investment company for purposes of this section. Section 4(c)(7) can be viewed, more or less, as an extension of section 4(c)(6) which permits a bank holding company to directly or indirectly through subsidiaries own up to 5 percent of the voting stock of any nonbank company. In fact, until the Amendments of 1966, the Bank Holding Company Act incorporated both section 4(c)(6) and section 4(c)(7) under one section. From a practical standpoint, the parent company is allowed, under section 4(c)(6), to directly engage in the same activities as an investment company. Accordingly, most holding companies conduct these activities through the parent company, rather than through an investment company subsidiary. Such an arrangement prevents duplicate payment of certain taxes and provides more flexibility for utilizing funds in other areas of the organization.

3060.0.3 INSPECTION OBJECTIVES

3060.0.3.1 Section 4(c)(6)

1. To determine that the investments held pursuant to section 4(c)(6) comply with the Act and 12 C.F.R. 225.101 and 225.137.

2. To determine that no more than 5 percent of the voting shares of any nonbank company (other than those owned pursuant to other provisions of the Act) is held by the bank holding company and its subsidiaries.

3060.0.3.2 Section 4(c)(7)

1. To determine the overall quality of the investments held.

2. To determine the financial impact of the ownership of such shares upon the bank holding company and its subsidiaries.

3. To determine if policies, practices and procedures regarding investments are adequate.

4. To suggest corrective action where necessary in the areas of policies, procedures, or laws and regulations.

3060.0.4 INSPECTION PROCEDURES

3060.0.4.1 Section 4(c)(6)

1. Review investments held to determine that the BHC has a total interest of no more than 5 percent.

2. Determine that 5 percent does not constitute control.

3. Determine that the BHC is not "engaged" in any nonbank activity through its 5 percent ownership.

3060.0.4.2 Section 4(c)(7)

1. Where section 4(c)(7) applies, compare the investment company's general ledgers with statements prepared for the latest FR Y–6.

2. Obtain schedules of investments in voting shares of any companies. Review quality of such shares (utilizing rating service publications, etc.) and check for ownership interests exceeding 5 percent.

3. Review policies (written or oral) regarding purchase and sale of stocks.

4. Obtain and evaluate documentation relating to credit review for securities held. Determine adequacy of procedures to maintain credit updates.

5. Compare carrying value of stocks to current market value to determine market depreciation, if any and determine adequacy of any established reserves.

6. Perform verification procedures, including physical review of stock held in safekeeping, where practical.

7. Determine that purchases and sales of stocks are appropriately approved by directors or designated officers.

8. Review minutes of the board of directors meetings (where an investment company subsidiary is involved).

3060.0.5 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
4(c)(6) Applicability to shares acquired D.P.C.		225.101	4–187	
Aggregating shares owned by subsidiaries		225.101	4–187	
Five percent limit on ‘‘any class of voting securities’’		225.137	4–189	
Control with less than 5 percent		225.137	4–189	
4(c)(7) Indirect ownership of shares of investment company		225.102	4–188	

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Section 4(c)(8) of the BHC Act (Mortgage Banking)
Section 3070.0

A mortgage banker specializes in the origination, acquisition, and sale of residential real estate loans to permanent investors (the secondary mortgage market). Most mortgage banking firms that are affiliated with banks and bank holding companies primarily originate residential real estate loans, although some firms may engage in interim and other lending secured by real estate. Unlike their nonbank competitors, the vast majority of the loans mortgage banks originate are sold to permanent investors in the secondary mortgage market.

Mortgage banks can retain or sell their loans and sell or retain the servicing of their mortgages. The mortgage banking industry currently offers a wide variety of products, market mechanisms, financing vehicles, and financial strategies due to competitive pressures within the mortgage banking industry and rapid growth in the demand for loans and related securities within the secondary mortgage market. Mortgage bankers use these marketing and financing strategies to differentiate themselves from the competition in terms of interest rates, maturities, down-payment requirements, and product offerings.

The earnings stream, cash flow, and capital needs of a mortgage banking company are all highly influenced by management's decision whether to retain or sell the mortgage loans as well as the related mortgage-servicing rights. The majority of loans that are sold in the secondary market are originated under government-sponsored programs. Such loans are either sold directly or are converted into securities that are collateralized by the underlying mortgages (mortgage-backed securities). The pools of collateralized mortgage loans backing mortgage-backed securities provide a form of risk diversification for the investor.

Originations, secondary market sales, and servicing constitute the primary functional business lines within a typical mortgage company. As an originator of mortgages, the company is responsible for the initial phase of the mortgage, from original contacts with the borrowers to the closing of the loans. At closing, the company disburses its funds and becomes the lender of record. Mortgage loans can also be acquired through a network of correspondent companies. Most mortgage banking companies use a combination of origination and acquisition strategies. The decision about whether to originate or purchase loans also varies over time due to fluctuations in demand and pricing discrepancies.

The secondary marketing department is responsible for selling loans in the secondary market and managing the interest-rate risk associated with loans during the interim period. In most cases, the mortgage company retains the loans until it can find a permanent investor to purchase the loans. The mortgage banker obtains purchase commitments from permanent investors and submits completed loan documentation packages to the investors for their approvals in satisfaction of the commitments.

As part of the overall process, the mortgage banker maintains a relationship with a variety of other permanent investors to whom the originated mortgages are sold. These investors are generally institutional investors such as securities dealers, commercial banks, life insurance companies, pension funds, and other financial and nonfinancial institutions. Some of these investors are restricted by state law, charter, or bylaws as to the type of mortgages and the locations of the property in which they can invest. Accordingly, their purchase commitments should incorporate these limits as well as the price and/or required yield of the mortgage loans or mortgage-backed securities. When these commitments are filled and the mortgages sold to the investors, the mortgage banker may retain the servicing rights to the mortgages it sells to permanent investors or sell the servicing rights in the secondary market.

The servicing department manages the loans that were retained in permanent loan portfolio or those that were sold to another permanent investor. Fees paid for services rendered in administering the mortgage portfolios of investors are a principal source of revenue for most mortgage bankers. In general, the company receives a fee that is usually based on a percent of the unpaid balance of the administered mortgages. In return for the fee, the servicer is responsible for collecting and remitting payments, managing the tax and insurance escrow accounts, inspecting the properties when required, pursuing delinquent borrowers, foreclosing on the mortgages when necessary, and providing accounting support. Considering the services rendered and the generally low fees involved, the servicing portfolio must be sizable for the company to be profitable. The servicing portfolio may represent very little credit risk to the servicer and can be a valuable source of residual income to the company.

The mortgage banking industry is experiencing significant consolidation. To be competitive, participants must maximize economies of scale and efficiencies. Emphasis has been placed on using more efficient systems and technologies that enhance loan processing, underwriting, servicing, and the management of pipeline risk (the interest-rate risk associated with the holding period for the mortgages). Existing mortgage banking firms are larger and operate more efficiently (faster, cheaper, and with higher quality) than they did in the past. Operating efficiencies are achieved through the use of sophisticated information systems, such as electronic data interchange, imaging, optical character recognition, expert systems, and other forms of artificial intelligence.

Within a bank holding company, mortgage banking subsidiaries generally focus on residential mortgage lending. As discussed initially, these mortgage bankers may also engage in other forms of lending. On an industry basis, they extend loans to real estate brokers who buy properties for resale, engage in second mortgage and home improvement lending (usually through dealer agreements), and extend interim loans. Interim loans represent a means of funding a project through one or more phases, with the property and improvements as collateral for the loan. The size of interim loans may range from a single residence under construction to large industrial, commercial, or residential projects. Construction lending and other forms of lending may be provided by other such real estate lending subsidiaries located elsewhere within the bank holding company's organizational structure.

The mortgage banker, as a lender, has the flexibility to fund any and all phases of a project including land acquisition, development, and construction. Land acquisition credit may be extended for the acquisition of more than one parcel of land, which may not necessarily be identified with a specific project. More frequently, acquisition credit is tied into a specific project for which the lender expects to fund more than one phase. In development-phase lending, funds are advanced to ''improve'' the property, bring utilities on-site, cut roadways, and prepare the site for its intended use. Many residential and industrial park projects are funded through this phase, with the sale of individual parcels providing the repayment of the loan. Construction lending funds the project from the foundation to completion. For those loans that fund two or more phases, there may be no clear distinction between the phases as certain elements of each may be underway concurrently.

On large projects funded through completion, such as apartment and office buildings where the construction is to be repaid from a permanent mortgage, the lender will usually require the borrower to obtain a permanent mortgage commitment from a third party. While this ''takeout'' commitment may or may not be arranged through the lender's network of investors, this commitment provides the lender with some assurance of repayment. In some cases, particularly in unsettled market environments, these takeouts are not available, and the lender may issue a ''standby'' commitment. On occasion, no permanent financing will be available upon completion and the lender will extend a ''bridge'' loan for the interim period between project completion and the placement of a permanent mortgage. Making construction loans without takeout commitments from responsible term lenders could expose the construction lender to adverse interest-rate movements as well as the market acceptability of the project. The absence of a takeout can represent a weakness in a loan. The general lack of takeouts in a portfolio should be a criticizable management practice (unless mitigating circumstances prevail) and should be discussed with management.

This section provides inspection guidance and procedures for mortgage banking nonbank subsidiaries of bank holding companies. Except for the limited guidance that pertains only to bank holding companies, they may also serve as examination guidance and procedures for mortgage banking subsidiaries of state member banks. The way in which these procedures are used should be determined on a case-by-case basis depending on the size of a particular company and its business activities. The information in ''Board Oversight and Management,'' ''Financial Analysis,'' and ''Intercompany Transactions'' presented in this section is applicable to all mortgage banking reviews. The subsection ''Mortgage-Servicing Rights'' is recommended for use in companies that have significant risk exposure. The examiner should also target functional areas such as production, marketing, and servicing/loan administration.

3070.0.1 BOARD OVERSIGHT AND MANAGEMENT

The examiner should assess the quality and effectiveness of a mortgage banking company's board of directors (board) and executive management team, the appropriateness of its organizational structure, the nature of its internal control environment, and the effectiveness of internal control programs.[1] Such internal control programs may include internal and external audits, loan review, quality control over mortgage loans originated and/or serviced for investors, compliance, fraud detection, and related employee training programs.

The board and executive management team must be evaluated within the context of the particular circumstances surrounding each mortgage banking company. Since business complexities and operating problems vary according to the institution's size, organizational structure, and business orientation, directors and managers who are competent to effectively discharge their responsibilities under one set of conditions may be less competent as these conditions change.

Board oversight and management should be rated satisfactory, fair, or unsatisfactory based on both objective operating results and more subjective criteria. Performance must be evaluated against virtually all the factors necessary to operate the mortgage banking company's activities in a safe, sound, and prudent manner, including the ability to anticipate and plan for future events that may have a material impact on the company's financial condition. Such a rating should also be considered when assigning a consolidated rating of risk management (see section 4070.1 and SR-95-51).

3070.0.1.1 Board Oversight

The mortgage banking company's board provides oversight, governance, and guidance to the executive management team. The board may include executives of the mortgage banking company, executives of the bank holding company and other affiliated companies, and outside directors.

The examiner should determine whether a separate board exists, as well as the identity and qualifications of the members. Minutes of board meetings should be reviewed to determine whether directors are fulfilling their fiduciary responsibilities. At a minimum, directors should—

- select and retain a competent executive management team;
- establish, with management, the company's short- and long-term business objectives and adopt operating policies to achieve those objectives in a safe and sound manner;
- monitor operations to ensure they are controlled adequately and are in compliance with laws and policies;
- oversee the mortgage banking company's business performance; and
- ensure that the mortgage banking company meets the community's residential mortgage credit needs.

The examiner should assess whether directors exercise independent judgment in evaluating management's actions and competence, attend board and committee meetings regularly, remain well informed regarding the company's activities and the mortgage banking industry overall, and are knowledgeable regarding all applicable state and federal laws and regulations. The examiner should also review the quality of board reporting. Board reports must provide accurate and timely information to directors with respect to operating results, asset-quality trends, liquidity and capital needs, and relevant industry and peer-group performance statistics for each operational area. Directors should also receive information regarding exceptions to established policies and operating procedures, volume-related processing backlogs, and the effectiveness of the internal control programs. Information on hedging products and strategies should be routinely provided to the board and to holding company management. In connection with this portion of the review, examiners should also request and review information regarding all loans to insiders and their related interests to ensure that no preferential transactions have been extended to these parties.

3070.0.1.2 Management

The executive management team generally consists of a president and chief executive officer (CEO), chief operating officer (COO), chief financial officer (CFO), and senior executives in charge of production, marketing, and servicing/

1. See section 1010.1 of the *Commercial Bank Examination Manual* and a report, "Internal Control—Integrated Framework," which was issued in September 1992 by the Committee of Sponsoring Organizations of the Treadway Commission, for a more detailed discussion of internal controls. The Treadway Commission report broadly defines internal control as a process, effected by an entity's board of directors, management, and other personnel, designed to provide reasonable assurance regarding the effectiveness and efficiency of operations, reliability of financial reporting, and compliance with applicable laws and regulations.

loan administration. Management formulates operating policies and procedures and oversees the day-to-day administration of mortgage banking activities. Management should be evaluated in terms of its technical competence, leadership skills, administrative capabilities, and knowledge of relevant state and federal laws and regulations. The management assessment should evaluate management's attitude toward risk, as evidenced by the type of products that are offered; the existence of effective hedging programs; and/or the degree of reliance that is placed on the resources of affiliate banks, nonbanks, and other entities to support mortgage banking company activities.

Prudent operating policies and procedures that are consistent with the business needs and risk-management practices of the parent bank holding company should be in place for each functional area. An effective risk-management program should also be in place. Without adequate management oversight, excessive errors can occur, fraud or other violations of law may go undetected, and financial information may be reported incorrectly. Any of these events can damage the company's image, impair its access to external funding sources, and jeopardize its ability to originate and sell mortgage loans in the secondary market.

It is management's responsibility to develop and maintain management information systems (MIS), which should be dedicated to obtaining, formatting, manipulating, and presenting data to managers when needed. Such systems should generate accurate financial statements; identify the need for financial, human, technological, and physical resources; and produce timely and useful management exception reports.

Management should also be evaluated on its ability to plan effectively. Effective planning entails the annual approval of an operating budget and the development of a long-term strategic plan that helps management anticipate changes in the internal and external environment and respond to changing circumstances. Because losses on the origination of mortgage loans are common in the mortgage banking industry, management should assess the servicing time necessary to recapture costs and achieve required returns. This information is critical to decisions to purchase mortgage-servicing assets, and it should be incorporated into hedging strategies.

The strategic plan should identify the company's strengths and weaknesses, growth targets, and other strategic initiatives (including management's philosophy toward the business, the extent of financial risk-taking, commitments to maintaining procedures and controls in managing the business, and management's commitment to staff development) over a one- to three-year time horizon. Planning efforts should also address system deficiencies and technological advancements within the industry. Without appropriate planning, the company can only react to external events and market forces.

Management should be results-oriented, but not at the expense of sound risk-management practices. Goals and objectives should be specific and measurable. Management should develop a performance measurement system that tracks progress toward achieving both financial and nonfinancial goals.

3070.0.1.3 Organizational Structure

The organizational structure should be reviewed to determine, on a legal-entity basis, the relationship between the mortgage banking company, the bank holding company, and any other bank or nonbank subsidiaries. The structure should also be reviewed to determine whether the lines of authority are clearly defined, the responsibilities are allocated logically, and management depth is sufficient within each division, department, or functional area.

The president and CEO usually reports directly to the mortgage banking company's board of directors, as well as to an executive management committee at the affiliate bank or the bank holding company level. Other reporting lines may exist between functional area executives and their counterparts at either a bank affiliate or the holding company level.

3070.0.1.4 Control Environment

Management's attitude toward risk is communicated to employees through the company's corporate culture. In general, the CEO should establish and communicate a corporate culture that promotes safe, sound, and prudent business practices. The corporate culture should provide a positive control environment, set high standards, and reward ethical, desirable behavior.

Management's failure to communicate acceptable standards of behavior may encourage impermissible or high-risk business practices. For instance, compensation programs that are incentive-based may generate poor-quality loans. Below-market pricing strategies or overly aggressive growth targets may further exacerbate asset-quality problems or generate loans in excess of processing and servicing capabilities.

3070.0.1.5 Control Programs

Management controls in a mortgage banking company consist of an internal audit, an external audit, loan review, compliance, quality control over loans originated and/or serviced for investors, fraud detection procedures and related employee training programs, insurance coverage, and legal review. The examiner should review recent reports conducted by internal loan review, state and federal agencies, and private investors to determine the scope of the review, the nature of any problems noted, and the adequacy of management's response.

3070.0.1.5.1 Internal Audit

The internal audit function in a mortgage banking company is responsible for detecting irregularities; determining compliance with applicable laws and regulations; and appraising the soundness and adequacy of accounting, operating, and administrative control systems. Accounting, operating, and administrative control systems are designed to ensure the prompt and accurate recording of transactions and a proper safeguarding of assets.

Internal audit activities may be conducted through a separate department located on-site or through the internal audit department of the bank holding company. Very small financial institutions that do not maintain a separate audit function may rely solely on their external auditor to perform these functions.

Regardless of the organizational structure, internal auditors must be independent of the line areas being reviewed, have access to all company records, and maintain sufficient status and authority within the company. The internal auditors' findings should be reported directly to the board or a designated committee thereof.

The scope, frequency, and coverage provided through the internal audit program should reflect the size and complexity of the institution. The audit schedule should cover underwriting practices and other high-risk areas of mortgage banking, including the most significant balance-sheet accounts, income statement accounts, and internal control systems.

To yield meaningful results, the department must be adequately staffed with individuals who are experienced and knowledgeable about mortgage banking. Audit staff should receive ongoing training and be encouraged to hold professional industry certifications. Internal audit reports should be issued and responded to by line management in a timely fashion. Follow-up procedures should be in place to ensure that corrective measures are taken.

3070.0.1.5.2 External Audit

External auditors generally review and assess the mortgage company's financial condition and the adequacy of internal controls. The engagement letter sets forth the external auditor's responsibilities, scope, and extent of reliance that is placed on the internal audit department with respect to the type of engagement. When an external audit is to be performed, the audit is an examination that is conducted to determine that the present financial condition of the company and the results of operations are fairly stated and are in conformity with generally accepted accounting principles.

Examiners should review the most recent external audit report to determine whether the opinion regarding the company's financial statements and their disclosures was qualified in any manner. If applicable, examiners should note any significant concerns or weaknesses in the company's internal control structure. Examiners should also review management's written response to the audit to determine whether corrective measures were appropriate, complete, and timely and whether the response reveals any internal control weaknesses.

The reason behind any changes in external audit firms used should be investigated. Unusual items and areas of potential concern should be discussed with management and/or the external auditor. If questions arise during the safety-and-soundness review, the examiner should determine whether the area of concern was considered to be a material item by external auditors, the nature of audit work performed, and the outcome of that review. If questions persist, the examiner may want to request access to specific external audit workpapers.

3070.0.1.5.3 Loan Review

Loan review activities may be conducted at the mortgage banking company or in conjunction with the loan review activities of either an affiliate or the parent bank holding company. In any event, loan review should determine whether mortgage loans that are originated and/or purchased meet underwriting standards as defined in the internal loan policy. Loan review may also sample loans to determine whether they meet underwriting criteria established by investors. The scope of the loan review program should be evaluated. The examiner should also review a copy of the most recent loan review to determine whether problems are identified and addressed in a timely manner.

3070.0.1.5.4 Quality Control

Mortgage banking companies that service loans for investors must also maintain a separate quality control department to test the quality of loans produced and serviced for investors. Investors such as the Government National Mortgage Association (GNMA or Ginnie Mae), Federal Home Loan Mortgage Corporation (FHLMC or Freddie Mac), and FannieMae issue very specific guidelines that must be met with respect to the scope and frequency of such reviews.

At a minimum, these investors require that the mortgage banking company sample at least 10 percent of all closed loans each month and conduct a quality control review to determine the extent of accuracy, completeness, and adherence to agency underwriting standards. Random samples should include loans originated through the company’s own production network, purchased loans, loans for which work was performed by a third party (outsourced), and loans with various product characteristics, such as a high loan-to-value or a convertible feature.

Quality control personnel reverify loan documentation, including the appraisal, down payment, employment, and income information. After each review, the department should issue a comprehensive report detailing specific quality control findings and recommendations. Quality control reviews must be completed within 90 days of closing. Exceptions to company policy or investor underwriting standards should be documented and communicated to executive management. Corrective measures should be initiated promptly.

The quality control function should serve as an early warning system that alerts management to situations that may jeopardize the financial strength, image, or origination and sale capacity of the company. To function as an effective management control, the quality control department should operate independently from the production and servicing/loan administration departments. Quality control should complement, not substitute, work performed by the internal audit and loan review functions.

3070.0.1.5.5 Insurance Program

The insurance program should be reviewed to determine whether coverage adequately protects the mortgage banking company and its affiliates against exposure to undue financial risk. Insurance policies should be reviewed and approved by the board at least annually.

3070.0.1.5.6 Litigation

The legal department should be contacted to determine whether existing or pending litigation exposes the mortgage banking company or its affiliates to undue financial risk. Particular attention should be paid to the status of any actual or pending class action lawsuits of a material nature.

Examiners should also determine whether procedures exist to detect and investigate suspected fraud, either internal or external. In many instances, the legal department coordinates fraud training and investigations, as well as the submission of criminal referral or suspicious activities reports and the initiation of legal action. If a separate fraud division or unit does not exist, examiners should determine whether procedures governing the detection, investigation, and referral of potentially fraudulent situations exist and function effectively. Examiners should also determine whether management reports adequately detail and track potential exposure.

3070.0.1.6 Inspection Objectives—Board Management and Oversight

1. To assess the composition, qualifications, and degree of oversight provided by the mortgage company’s board and executive management team.

2. To determine whether the organizational structure is appropriate given the nature and scope of the mortgage banking company’s operations.

3. To evaluate the reasonableness of the operating budget, long-term business planning, performance measurement systems, and MIS and related management and board reports.

4. To determine the nature of the company's internal control environment and the effectiveness of its system of internal controls, including internal and external audits, loan review, quality control, suspicious activities and fraud detection (including criminal referral and suspicious activities reporting) and related employee training programs, insurance coverage, and pending litigation.

3070.0.1.7 Inspection Procedures—Board Management and Oversight

Board Oversight

1. Review biographies of the board of directors and minutes from board and committee meetings to determine whether directors are qualified and fulfilling their fiduciary responsibilities.

2. Review the most recent package of information that was provided to directors. Do they receive sufficient detail regarding the financial condition, internal controls, and risk-management techniques employed within the company?

Management

1. Review biographies of members of the executive management team to determine their level of experience, technical knowledge, leadership skills, and administrative capabilities. Discuss whether salaries are commensurate with management's experience level and expertise.

2. Evaluate the quality of operating policies and procedures within each division or functional area and the extent to which compliance with such policies and procedures is monitored and reported.

3. Evaluate the output from the planning process, including the most recent operating budget, business plan, and related performance measurement system reports. Determine whether objectives, goals, and growth targets are reasonable.

Organizational Structure

1. Review the organization chart to determine whether the organizational structure is appropriate, as well as the appropriateness of the division of functional responsibilities and the degree of management depth within each division or functional area.

Internal Control Environment

1. Evaluate the nature of the internal control environment and how risk parameters are communicated to employees.

Internal Control Programs

1. Assess the effectiveness of internal controls in identifying and controlling risks. Internal controls include internal and external audits, quality control for mortgage loans, insurance coverage, and fraud detection procedures and related employee training programs.

Internal Audit

1. Determine whether a separate internal audit function exists and, if so, its degree of independence.

2. Review the qualifications of the internal audit manager and his or her staff for mortgage banking and accounting and auditing expertise. Consider the size of the department and its ongoing training programs, as well as the experience levels, educational backgrounds, and professional certifications of the department's staff.

3. Determine the scope and frequency of the internal audit program to ensure that all high-risk areas are reviewed regularly.

4. Review all internal audit reports, management responses to them, and follow-up audit reports for work conducted since the previous inspection.

5. Select a significant sample of internal audit reports and respective workpapers and conduct an intensive review of the internal audit program. Determine that all issues and exceptions were brought forward to the final audit report, the report was presented to the board or a committee thereof, and that any detected and disclosed problems or control weaknesses received appropriate management attention.

6. Evaluate the internal audit department's system for following up on issues and exceptions. Determine whether prompt, satisfactory resolution of issues was effected.

External Audit

1. Review the engagement letter for the most recent external audit to determine the external

auditor's scope, responsibilities, and extent of reliance on the internal audit department.

2. Review the most recent external audit report to determine whether the opinion regarding the company's financial condition was qualified in any way and whether any internal control weaknesses were noted. Review the notes to the financial statements for appropriate disclosures.

3. Discuss any unusual items and areas of potential concern with management and/or the external auditor. Determine whether any areas of concern were considered to be material items by the external auditors, based on the nature of audit work performed, management's representations in the management letter, and the outcome of that review. If questions persist, consider the need to request and review specific external audit workpapers.

4. Discuss the reasons for any recent changes in external auditors with management.

Compliance and Disaster Recovery

1. Review the methods used to ensure compliance with state and federal laws and regulations by—

a. interviewing the person who is responsible for compliance to determine the nature of outstanding problems and the adequacy of corrective measures that have been taken, and

b. reviewing the system for logging, tracking, and responding to customer complaints.

2. Determine whether the disaster recovery plan is adequate.

Quality Control

1. Review the quality control department's policies and procedures to determine whether the quality control program meets minimum investor requirements.

2. Review a sample of reports issued by the quality control unit to determine whether they were issued in a timely manner and conclusions were adequately documented.

3. Determine whether quality control results are relayed to executive management and whether follow-up procedures are adequate.

4. Determine whether the quality control unit is sufficiently staffed and independent.

5. Determine whether quality control outsources work to outside parties. If so, are adequate controls in place to ensure that such outsourcing meets the company's own quality standards?

Insurance

1. Review insurance policies maintained for the mortgage banking company to determine whether coverage is adequate and whether the majority of insurable risks is included, giving consideration to a cost versus benefits analysis.

2. Review board minutes to ascertain the date the board last reviewed and approved the insurance program.

Litigation

1. Review all current and pending litigation of a material nature and determine whether adequate reserves are maintained to cover anticipated financial exposure.

Fraud Detection and Training

1. Determine whether a separate fraud unit exists and whether procedures are in place regarding the detection and investigation of suspected fraudulent activity and the issuance of related management reports.

2. Evaluate the company's early warning system for detecting potential fraud. Is the level of training adequate?

3. Review any criminal referral or suspicious activities forms filed since the prior inspection and discuss their status with management.

3070.0.2 PRODUCTION ACTIVITIES

Loan production covers the process of originating or acquiring loans. Production begins with the initial loan application and ends when a loan has been underwritten and processed, closed, and reviewed by post-closing.

3070.0.2.1 Types of Loans

Loans are categorized as either government or conventional loans. *Government loans* generally carry a below-market interest rate and are either insured by the Federal Housing Administration (FHA) or guaranteed by the Veterans Administration (VA). Both agencies protect investors holding such securities against losses in the event of a borrower default, thereby slightly reducing investors' required yields. To be insured or guaranteed, a loan must meet agency standards regarding the size, interest rate, and terms. The lender can obtain a certificate of insurance or guaranty to give support to a loan for securitization. A certificate of insurance or guaranty may not be needed for a loan to be securitized.[2]

Loans that are not FHA-insured or VA-guaranteed are referred to as *conventional loans*. Conventional loans are generally originated for larger loan amounts and made to stronger borrowers. Conventional loans typically require higher down payments and bear market interest rates. Most lenders that offer programs with smaller down-payment terms require that the borrower purchase private mortgage insurance for the top 5 to 20 percent of the loan principal balance so that a proportionate share of the credit risk is borne by a private mortgage insurance (PMI) company.

The extent of credit risk associated with a loan often depends on the marketing program under which the loan is originated. Marketing programs and participants are described briefly here; for a more detailed description, see ''Marketing Activities'' later in this section.

The market for residential real estate loans is dominated by three government-sponsored entities: the Government National Mortgage Association (GNMA), the Federal Home Loan Mortgage Corporation (FHLMC), and the Federal National Mortgage Association (FannieMae). GNMA is a government agency that guarantees the timely payment of principal and interest on pass-through securities that are backed by pools of FHA-insured or VA-guaranteed mortgages. These guaranties are backed by the full faith and credit of the U.S. government. Although investors will get paid in full, servicers may retain some risk of loss, particularly with respect to VA loans (see subsection 3070.0.4.5 for additional information on ''VA no-bids'').

Pass-through securities provide for monthly installments of interest at the stated certificate rate plus scheduled principal amortization on specific dates, despite the delinquency status of the underlying loans, as well as any prepayments and additional principal reduction. The issuer collects the mortgage payments and, after retaining servicing and any other specified fees, remits monthly payments to the certificate holders.

Although FHLMC and FannieMae are not extensions of the U.S. government, the market believes that there is an implicit guaranty that their securities will be repaid. FHLMC and FannieMae securitization involves the purchase of conventional loans from lenders and the selling of mortgage-participation certificates, which are similar to GNMA pass-through securities. Participation certificates represent an ownership interest in pools of conventional loans. FHLMC and FannieMae guarantee the monthly pass-through of interest, the scheduled amortization of principal, and the ultimate repayment of principal. Unlike GNMA pass-throughs, however, participation certificates are not backed by the full faith and credit of the U.S. government.

Conventional loans are classified as either conforming or nonconforming. *Conforming* loans must comply with FannieMae's and/or FHLMC's underwriting and documentation guidelines in order to be sold in the secondary market. Conforming mortgages may be sold to FannieMae or FHLMC on either a recourse or nonrecourse basis.

Private pools of *nonconforming* loans that do not meet FannieMae or FHLMC guidelines may be sold in the secondary market under a private label structure. Nonconforming loans are often ''nontraditional'' products such as loans with teaser rates, limited documentation, and graduated payment schedules, as well as ''jumbo'' loans that exceed maximum agency size requirements. To improve salability, pools of nonconforming loans may be insured through third-party credit enhancements (for example, letters of credit) or various senior/subordinate structures. Since the underlying mortgages generally already carry private mortgage insurance, such pools are, in effect, doubly insured.

3070.0.2.2 Production Channels

Mortgage loan applications are generated through either *retail* (internal) or *wholesale* (external) production channels. Retail loans are originated through the company's own branch network. A branch network is relatively costly, since origination costs often exceed the origination fees received from the borrowers.

Wholesale production channels (where contact with the borrower is made by another party) take several forms. Whole loans can be purchased either individually or by using bulk commitments. Bulk commitments either require the correspondent to deliver a set amount of loans (mandatory) or deliver all registered loans that close (best effort or optional).

2. See the appropriate agency seller/servicer guide for standards and requirements regarding certificates of insurance or guaranty.

Loans may be closed in the buyer's own name using its own funds, closed in the seller's name using the buyer's own funds, or closed and funded by the seller with delivery to the buyer within a certain number of days. If the seller closes in its own name, the mortgage and note are generally assigned to the buyer simultaneously upon closing.

Three hybrid production channels are worth mentioning here. Examiners should note that terminology within the industry varies greatly. Under the first method, *table funding*, a mortgage banking company funds loans at closing that have been originated by a correspondent or broker according to the company's own specifications. Historically, the company's ability to record mortgage-servicing rights depended on the degree of independence that was maintained and the extent of risk borne by the originator. See subsection 3070.0.6, on ''Mortgage-Servicing Assets and Liabilities.''

The second hybrid method, *assignment of trade*, involves the bulk purchase of loans and investor commitments to sell the loans in the secondary market. The purchaser bears virtually no market risk under this production method. The third hybrid method, *co-issue*, entails the acquisition of servicing rights only, at the time a security is issued.

Most mortgage originators operate on a nonrecourse basis. For purchasers of correspondent production, credit risk increases to the extent that the lender relies on other parties to correctly process and underwrite the loan. Contracts with correspondents should include representations and warranties from the correspondent that loans delivered meet the underwriting requirements of the agency or investor program for which the loan was originated. Approved correspondent lenders should be continually monitored for the quality of the product delivered and the financial ability to repurchase mortgages that do not meet the standard representations and warranties under which the mortgages are sold.

3070.0.2.3 Production Strategies

A successful production strategy combines high credit-quality standards with cost containment and effective marketing. In contrast, an overly aggressive or inappropriate strategy leads to heightened production risk. High-risk production strategies can be evidenced by relaxed credit standards, low documentation requirements, an executive officer's compensation based on volume, an emphasis on high-risk product types or geographic areas, and/or dependence on a limited number of production channels. Examiners are responsible for recognizing and reaching agreement with management to better control such high-risk production strategies where appropriate.

3070.0.2.4 Production Process

There are five principal steps in the retail production process: (1) pipeline entry, (2) processing, (3) underwriting, (4) closing and funding, and (5) post-closing. Each of these functions should be independent from one another and separately supervised to ensure the quality of the loans produced. Each step is briefly discussed below.

1. *Pipeline entry*. A loan has entered the pipeline when a prospective borrower completes a loan application. The applicant authorizes the lender to verify his or her employment, credit history, bank deposits, and other information that evidences repayment capacity.
2. *Processing*. The application is then processed to qualify the applicant and the property for the loan. Processing personnel verify the applicant's employment history and credit information and order an appraisal on the property. Processing activities should be controlled through standardized procedures, checklists, and systems.
3. *Underwriting*. The underwriting unit approves or disapproves applications based on underwriting criteria that are established by the FHA, VA, FannieMae, and FHLMC and by private mortgage insurers and institutional investors. To ensure objectivity, the underwriting unit should not report to management of the production function.
4. *Closing and funding*. After an application has been approved, the lender generally issues a commitment letter to the borrower, which states the interest rate and terms of the loan. At closing, the lender or its agent obtains all the legal and related documents executed by the parties to the sale, disburses the proceeds of the loan, and collects certain funds from the borrower.
5. *Post-closing*. After closing, a post-closing review is performed to ensure that documents were properly executed and underwriting instructions were followed. The post-closing review also identifies any trailing or missing documents that must be tracked and obtained to meet investors' pool certification requirements. Specific

agency requirements are detailed in the agency seller/servicer guides. Before the loan is transferred to the delivery or shipping department, processing begins for the final mortgage insurance (from the private mortgage insurer or from the FHA/VA guaranty certificate). Receipt of the actual certificate may take 45 to 60 days or longer. Pool custodians and investors will allow the lender to complete the sale if final documentation, including the insurance certificate, is expected to be received within a reasonable timeframe.

3070.0.2.5 Production Risks

The production process can present risks of both a short- and potentially long-term impact. Operational inefficiencies can result in high management and staff turnover, an inability to meet investor documentation requirements, an increasing number of pools that have not received final certification, or an unusually high production cost structure. Operations risk often increases during peak volume periods. If additional resources (which can include independent service providers) are not allocated to the processing, underwriting, closing, and post-closing areas, delinquency levels may increase and workloads may exceed existing capacity.

Management should be prepared to quickly respond to interest-rate cycles and related volume increases or declines, since failure to act promptly can affect earnings and capital. During the pooling and securitization process, for example, if the number of pools that lack final certification exceed a certain limit, the company may be required to seek financial support in the form of a letter of credit from an affiliate bank or bank holding company to ensure that all required loan documentation is secured in a timely manner. Credit risk and operational inefficiencies may also create liquidity problems and additional interest-rate risk if the company is unable to sell its loans in the secondary market.

To the extent a company retains servicing on either its retail or correspondent production, long-term credit risk issues may develop. These include exposure to the pools being serviced through recourse arrangements, potential nonreimbursable foreclosure costs, or costs associated with VA ‘‘no-bid’’ options.

3070.0.2.6 Overages

In certain instances, originators and loan brokers may have the ability to deviate from mortgage loan prices that are established by the marketing department. An overage exists when a lender permits an originator or broker to impose a higher number of points (or a higher interest rate) on a loan to certain borrowers than is imposed for the same product offered to other borrowers at a given point in time. (See CA-94-6.)

Overages are often used as an incentive to compensate originators or brokers. The amount that is received over the expected price is often shared by the mortgage banking company and the originator or broker. The practice of permitting overages may contribute to or result in lending discrimination under the Equal Credit Opportunity Act (ECOA) and the Fair Housing Act (FHAct).

Examiners should review the mortgage banking company’s lending policy and determine whether overages are permitted and whether the practice has resulted in lending discrimination. If a more detailed review of overages is deemed necessary, such review should be performed in conjunction with the appropriate Federal Reserve System’s legal and consumer compliance staff.

3070.0.2.7 Inspection Objectives—Production Activities

1. To determine the types of loans offered to borrowers and any significant changes in product mix.
2. To determine whether mortgage loans are securitized; if so, to determine whether mortgage-backed securities are insured or otherwise guaranteed by government-sponsored agencies or private entities.
3. To determine what channels are used to originate loans.
4. To determine if production processes are consistent with operational risk controls and efforts to minimize risk.
5. To determine whether production processes can handle cyclical changes in volume.
6. To determine whether overages are permitted and to assess whether the practice has resulted in lending discrimination.

3070.0.2.8 Inspection Procedures—-Production Activities

General

1. Review organization charts to determine

the structure of the production function and its status within the company. Verify that functional units such as underwriting and quality control are independently managed.

2. Determine the types of mortgage products offered and the company's target markets. Evaluate portfolio trends for overreliance on one product type and undue concentrations in one geographic area.

3. Discuss the company's credit culture, compensation methods, and growth targets to determine whether income and loan volume are emphasized over credit quality.

4. Determine whether the level of nonconforming or unsalable loans being originated present undue risk and whether the quality and delinquency trends for such loans are adequately monitored.

Originations

1. Review policies and procedures for retail branch originations. How are originators compensated? Determine whether originators have the authority to alter loan pricing parameters set by the marketing unit.

2. Determine the size of the branch network and its cost structure. Is the network growing or shrinking? How does management plan for anticipated changes in loan volume?

3. Determine if the mortgage banking company is involved in overage activities. If so—

a. determine whether management has developed comprehensive policies and procedures, detailed documentation and tracking reports, accurate financial reporting systems and controls, and comprehensive customer complaint tracking systems to adequately monitor and supervise overage activities;

b. review whether overages are an essential component of the mortgage banking company's earnings and origination activities, and review the percentage of mortgages originated since the previous inspection that resulted in overages and the average overage per loan;

c. determine if management reviews overage activity for disparate treatment and disparate impact; and

d. determine if overages are a major component of loan officer and/or broker compensation.

4. Review policies and procedures for wholesale purchases. Which production channels are used and how do they work? Channels may include whole loan purchases (production flow), table funding, assignment of trade, or co-issuances (bulk purchases of servicing rights only). For each production channel, review how brokers and correspondents are compensated.

5. Review the method for reviewing and approving brokers and correspondents and specific programs under which wholesale loans are purchased. Is there an approved list of correspondents? How is it updated and how frequently? Determine whether exceptions to this list are made and by whom, and whether controls are in place to prevent unauthorized purchases.

6. Evaluate the process for conducting financial reviews on correspondents. How often are financial statements obtained, and who analyzes them?

7. Determine whether adequate controls are in place to detect changes in the financial condition of a correspondent, test and monitor the quality of loans purchased, and evaluate the correspondent's financial capacity to perform under contractual repurchase obligations.

8. Select a sample of contracts for the largest correspondents for additional review. Do contracts clearly state pricing structures, maximum dollar volumes, recourse arrangements, and whether loans are purchased on a mandatory delivery or a standby basis? Have any legal issues arisen as a result of the contract language? How frequently does management put back loans to its largest correspondents?

9. Determine whether management information systems adequately track approvals and denials by loan type and production channel. Are exceptions to policy adequately tracked and monitored?

Processing

1. Determine whether processing is performed in-house or by another party (a third-party contractor or the originator). Review checklists and procedures for the processing unit and determine whether loan tracking systems are adequate.

2. Review steps that have been taken to address any audit or quality control findings. Determine whether additional corrective actions are necessary.

Underwriting

1. Determine whether underwriting is performed in-house, by third-party underwriters, or by the originator. Is management planning for

peak volume periods and are controls over the underwriting process adequate?

2. Review policies and procedures to gain a reasonable assurance that underwriting standards are prudent and comply with investor guidelines. If individual underwriters perform this function, determine whether management has established approval limits, developed exception procedures for loans that are rejected or suspended, and receives reports that track loan quality for each underwriter. If a committee performs the underwriting function, review its charter, composition, and minutes. If a scoring system is used, review credit scoring methodology. Can the system be overridden? If so, by whom?

3. Review a representative sample (preferably a statistical sample) of current loans to test the underwriting policies and procedures and also determine the validity and adequacy of documentation supporting loans held for sale or investment.

4. If an unusual increase in unmarketable loan inventory has been noted, select a small sample of loans in current production for additional review. Does underwriting comply with established guidelines? If a credit scoring system is used, focus on loans that are of the lowest acceptable grade. If deficiencies are noted, consider expanding the review sample.

5. Review loans that were rejected and then approved. Did the proper authority approve such loans, and was management's rationale adequately documented?

Closing/Post-Closing

1. Evaluate procedures, checklists, and systems for closing loans. Are all required documents obtained from the borrower before funds are disbursed? If not, evaluate the appropriateness of suspense items.

2. Determine if a post-closing documentation review process exists to differentiate, track, and obtain both trailing and missing documents. Assess its effectiveness.

3. Determine if wholesale loans are re-underwritten at delivery. If not, how does management ensure that loans are re-underwritten in accordance with secondary marketing program requirements?

4. Determine the number of pools that lack final pool certification. Has this number exceeded the maximum allowable limit since the previous review? Why has this problem occurred, and what steps are being taken to secure the necessary documentation? Has a letter of credit been posted? Does the situation pose undue financial risk for the company or any of its affiliates?

3070.0.3 MARKETING ACTIVITIES

The marketing department is typically responsible for the development of mortgage products, determination of products to be offered, and the establishment of daily mortgage prices. The marketing department, which is also referred to as secondary marketing, is also responsible for the sale of mortgage loans to investors. Given these roles, the marketing department acts as an intermediary between the borrower and the investor. All of these activities require close coordination to be effective and are appropriately placed within one department.

3070.0.3.1 Oversight

Marketing activities are generally supervised by a marketing committee, which may consist of the chief executive officer, chief operating officer, chief financial officer, and the executive officers responsible for marketing, production, and servicing/loan administration. The marketing committee is responsible for the formulation of marketing policies, departmental operating procedures, pricing strategies, and parameters governing the use of various mortgage-related products and strategies used to hedge the interest-rate risk associated with certain mortgage loans.

3070.0.3.2 Securitization

The marketing department's primary tool in performing its activities involves securitization outlets. Securitization activities are discussed in SR-90-16, which transmitted the following documents: (1) the Examination Guidelines, (2) An Introduction to Asset Securitization, and (3) Accounting Issues Relating to Asset Securitization. There is also a discussion of these activities in the *Commercial Bank Examination Manual*, section 4030.1. A review of the securitization process can provide a clearer understanding as to the value the marketplace assigns to a mortgage banker's production. Mortgage securities, however, are usually issued by an entity other than the mortgage banking company under inspection (such as government-sponsored agencies, securities affiliates, or brokerage firms).

Many approaches are used for securitization, but the great majority of activity occurs with conduits such as GNMA, FHLMC, and FannieMae. Conduits provide many programs that a mortgage originator can use to deliver a mortgage or pools of mortgages in return for cash or securities. To investigate current program requirements and available options, the examiner should consult the seller guidelines issued by the agencies.

The securitization process presents the marketing department with a complex set of options to consider when deciding how to sell the company's loan production for maximum profit. If the company's own servicing valuation differs from pricing offered by the agencies, for instance, the marketing department can use some flexibility in pool formation guidelines to retain or divest servicing cash flows. Recourse to the originator or servicer can be negotiated to reduce agency guaranty fees. Agencies also alter guaranty fees based on different methods of remitting principal and interest payments. Sales to the agencies can be on a best-efforts or mandatory basis. A best-efforts basis is when loan delivery is not required if the loan does not close. Better prices are received for the lender's acceptance of the more rigid performance requirements of mandatory commitments. Master commitment contracts can be reviewed by the examiner to determine negotiated terms.

Although most securitization activity occurs within the programs already mentioned, private security issues are also used. The private issues are used primarily for loans that do not meet the underwriting criteria of the agencies, commonly due to larger than accepted loan amounts (jumbo loans). Nonconforming loan production is usually sold to brokers or security affiliates who have marketed the product to investors, sometimes using complex real estate mortgage investment conduits (REMICs).

3070.0.3.3 Pooling Practices

As an intermediary between the borrower and the investor, marketing personnel coordinate the flow of loan documents from the shipping department to the pool custodian and the ultimate holder. If servicing is retained, the loan will be input into the company's servicing system soon after closing. Staffing levels should be adequate to ensure that processing backlogs are managed and workloads remain reasonable. Temporary help and/or outsourcing may be used during peak volume periods.

Operating procedures governing the selection of mortgage loans for pooling, packaging, and sale should be evaluated to ensure that the shipping and pooling processes are efficient and that loan files ultimately contain complete documentation. Management reports should identify and track the number of pools that lack final agency certification and the status of missing (unavailable) and trailing (delayed) documentation.

If third-party guaranties are used during the securitization process, procedures should also establish methods for evaluating and monitoring the financial condition of all third-party entities that provide credit enhancement. If loans or securities are sold with recourse, management reports should identify and track potential recourse obligations. Management should also analyze historical recourse losses by investor and product type and determine the appropriate level of reserves to cover estimated recourse exposure.

3070.0.3.4 Marketing Risks and Risk Management

3070.0.3.4.1 Techniques

The marketing department manages several risks, which can be categorized as follows:

- unsalability
- pricing
- fallout
- counterparty performance

3070.0.3.4.2 Unsalability

Under most circumstances, a mortgage banking company will originate mortgage products that are acceptable to GNMA, FannieMae, FHLMC, or other major investors. This minimizes the risk that mortgage products originated will not be marketable to investors and have to be retained as a portfolio investment. However, the marketing department may also initiate certain products that are intended for the loan portfolio of the mortgage company or portfolios of bank or nonbank affiliates. In the case of production for bank affiliates, underwriting and pricing arrangements must be structured to ensure compliance with the restrictions imposed by sections 23A and 23B of the Federal Reserve Act. See the subsections on production activities (3070.0.2) and intercompany transactions (3070.0.7).

3070.0.3.4.3 *Pricing Risk*

The mortgage banking business is volume driven. Because profit margins are thin and fixed costs associated with loan production can be large (especially in the case of a retail origination network), it takes a significant volume of mortgages to generate profits. Mortgage pricing decisions are critical because the price is a major determinant in the volume of mortgages originated.

Pricing strategies can be affected by divisional profit and loss allocations or external industry practices. A neutral price structure sets mortgage prices that are equivalent to the expected price for which the mortgages will be sold to investors, plus a normal servicing spread of 25 to 50 basis points depending on the type of loan. Daily adjustments are usually made to prices to reflect market changes for future settlement of mortgage-backed securities (MBS).

Due to regional or local competition, mortgage banking companies often find it necessary to deviate from a purely neutral pricing strategy to maintain volume in certain markets. However, large deviations from market price in either a lower or even upward direction can have adverse consequences. In addition to causing marketing losses, price cutting could place operational strains on the production and servicing areas. Premium pricing can position the company as a lender of last resort with adverse credit quality implications.

The marketing department attempts to minimize price risk by matching origination pricing with the price it expects to receive from investors. However, estimating the price at which the mortgages can be sold can be difficult because it is determined in large part by external factors such as interest rates. The longer the elapsed time between when the mortgage applicant decides to lock in a loan rate and the time the loan closes, the greater the risk that the prices for which the mortgages can be sold will change. Some companies encourage customers to ‘‘float’’ their interest rate until closing approaches to reduce the volume and costs of hedging.

3070.0.3.4.4 *Fallout*

A third type of risk that the marketing department manages relates to pipeline ‘‘fallout.’’ This is the risk that the proportion of loans in the rate-committed pipeline that are expected to close will change with a given change in interest rates. As market interest rates decline, fewer mortgages in the pipeline will close because applicants will opt to make new applications at the lower rates. As interest rates rise, the proportion of pipeline loans that will close increases as more applicants choose to lock in rates. Mismatches that occur in the long and short positions can result in financial losses when the institution needs to settle its trades.

3070.0.3.4.5 *Hedging Strategies*

The most common hedging strategy used to protect the inventory of closed loans and the rate-committed pipeline against adverse interest-rate movements involves the use of mandatory and optional forward sales of MBS. Under this hedging strategy, the inventory and rate-committed pipeline (the long position) are generally covered through short sales (mandatory delivery contracts with settlements corresponding to expected delivery volumes). Put and call options on MBS are sometimes purchased to manage heightened fallout risks during periods of volatile interest-rate fluctuations.

The typical practice is to hedge 100 percent of the closed loan inventory that is marketable. In addition, pipeline loans very near to closing are generally also hedged at or close to 100 percent. However, a significant degree of uncertainty exists as to the amount and timing of 30- and 60-day rate-committed pipeline closings due to interest-rate fluctuations, underwriting delays, and cancellations. To control exposure to rate movements, management must estimate the percentage of the rate-committed pipeline that is expected to close in the current economic environment.

Although estimation techniques vary, data are generally collected on a number of pipeline characteristics such as product type, whether the loan is a purchase or refinance, and whether it is retail- or wholesale-originated. Fallout behavior can vary depending on these and other factors. Based on this information, management then derives an estimated closing percentage that becomes management’s operating target for coverage of the rate-protected pipeline.

Marketing personnel often use simulation modeling to assess fallout percentages, assist in balance-sheet valuations, and develop appropriate hedging strategies. Such models may be either purchased from outside vendors or developed in-house, and they vary greatly in their degree of sophistication. In any event, the primary assumptions and inputs to the model should be reasonable, well documented, and reviewed periodically by both the marketing committee and by an independent source such as an internal or external audit. Results from the marketing simulation model should be provided to management through summary reports. Information may also be provided to bank holding company personnel for asset/liability management purposes.

Other products may also be used to hedge inventory loans and the rate-committed pipeline, particularly loans with an adjustable rate feature or other specialized characteristics. The marketing committee should review and approve all specialized hedge products used, the degree of correlation between the hedge product and the underlying position being hedged, and the degree of risk that each strategy or position entails. The accounting department should also determine whether such products qualify for hedge accounting treatment, establish appropriate management reports, and establish accounting policies. See subsection 3070.0.6, ‘‘Mortgage-Servicing Rights.’’

3070.0.3.4.6 Position Reports

To limit risk, the marketing committee should place prudent limits on the amount of exposure that can be incurred through hedging operations. Limits, which may be contained in the marketing policy, might establish a constraint on the size of uncovered long positions, require that coverage be maintained at the marketing committee’s current closure estimates, or establish a constraint based on an earnings-at-risk measurement.

Compliance with limits should be monitored through regular position reports, which should be provided to senior management (the marketing committee and perhaps the treasury function of the parent company, if they participate in decisions or policy enforcement) at least weekly. Position reports should detail the company’s long and short positions in relation to limits, as well as unrealized and realized gains and losses on loans and securities. Department managers generally require daily position reports in order to effectively monitor the position. Marketing position reports may not reconcile directly with reports prepared by the accounting department for financial reporting purposes. Significant differences should be investigated.

3070.0.3.4.7 Counterparty Performance

The marketing committee is also generally responsible for managing investor/counterparty performance risk. The marketing committee (or the treasury department of the parent bank holding company) should approve all brokers and dealers to which securities are sold before trading commences. Dealer limits should be established to limit the maximum amount of trades outstanding with each firm. Frequent position reports should be prepared to monitor compliance with established limits. The accounting department may be responsible for the ongoing monitoring of the financial capacity of the brokers and dealers.

3070.0.3.5 Inspection Objectives—Marketing Activities

- To review the types of products developed.
- To determine the pricing strategies offered to borrowers and investors.
- To review pipeline fallout estimation techniques.
- To review hedging methods as they relate to loan production.
- To determine whether information systems are adequate for senior management to monitor fallout behavior and hedge performance.

3070.0.3.6 Inspection Procedures—Marketing Activities

Management Oversight

1. Review the composition of the marketing committee and minutes from recent committee meetings to determine the nature and scope of its responsibilities, the frequency of meetings, and the degree to which oversight over marketing activities is provided.
2. Review the marketing policy as it relates to product offerings, pricing strategies, loan sales, and hedging operations. Are all relevant marketing risks identified? Note the date the marketing policy was last reviewed and approved by the board of directors.
3. Determine how management measures and controls interest-rate risk associated with closed loans in inventory and rate-locked loan applications in the pipeline. How are limits established and quantified (i.e., earnings at risk, economic value of equity at risk, percentage of capital, etc.)? Are such limits reasonable? Evaluate management’s oversight of asset securitization

activities in accordance with SR-90-16, as applicable.

4. Assess the adequacy of management information systems and related management reports that are designed to track compliance with established policy. Determine the extent to which operational practices adhere to policy. How are exceptions handled?

Securitization and Pooling Practices

1. Determine the secondary marketing programs used to sell mortgages to investors and the volume of sales under each program.

2. Discuss the strategies and procedures used for the selection of mortgage loans for pooling, packaging, and sale. Are there quality control procedures in place to ensure that the files of pooled loans contain complete documentation? What impact does strategy have on departmental profitability?

3. Evaluate the company's securitization practices:

- Determine how much risk the company retains and in what form.
- Determine the source, conditions, and costs of third-party guaranties. Verify that the financial condition of all third-party credit enhancers is substantiated.
- Determine the procedures used to obtain final pool certifications from investors (coordinate with the examiner(s) assigned to the production function). Determine the number and volume of securities that lack final certification. Is management doing everything possible to obtain missing documents? Are problems volume-driven or due to a lack of internal controls?

4. Determine whether loans or securities are sold with recourse. If so, are management information systems in place to track recourse obligations? Are analyses of recourse losses conducted by investor and product type? Are reserves held for recourse loans? What is the methodology for determining the adequacy of reserves? Review actual and potential losses. Are reserve levels adequate to cover identified exposure? Is compensation tied to trading profit?

Unsalability

1. Review the marketing policy to determine whether all mortgage products originated by the mortgage company are intended to be salable in the secondary market (for example, do they conform to guidelines issued by GNMA, FannieMae, FHLMC, or other major investors?). How is actual salability monitored?

2. Determine if mortgage loans that are not salable are generated specifically for the permanent investment portfolio of either the mortgage banking company or its bank or nonbank affiliates.

3. Determine who is responsible for the review of temporarily unsalable loans, the frequency of such reviews, the actions taken to correct documentation and/or credit deficiencies, and if internal controls are adequate. This information is needed to ensure that hedge volumes are accurate.

Pricing Strategies

1. Review the current list of mortgage product offerings and the daily price sheet. Are prices determined centrally and are they uniform? Discuss pricing strategies with management to determine whether the company uses a neutral, above-market, or below-market pricing strategy.

2. Ascertain what procedures are in place to ensure that deviations from the approved pricing policies receive the proper degree of scrutiny and approval by senior management. If such discrepancies are common, why is this occurring (competition, compensation schemes, or departmental profitability considerations)? What impact have such deviations had on production volumes and the company's overall profitability?

3. Determine what policies are in effect regarding customer rate-locks. If a rate-lock expires, is it automatically renewed or is it renegotiated at current interest rates? Are the number and dollar volume of loans with expired rate-locks adequately monitored and tracked?

Fallout

1. Discuss the methodology used to predict the volume of applications that are expected to ''fall out'' of the mortgage pipeline. Is fallout methodology well documented?

ALCO/Simulation Modeling

1. Determine whether the expected fallout ratio is based on intuition, historical data, or an empirical model. Are assumptions reasonable? Are volatility assumptions based on historical performance or on implied volatility levels in the market? Who is responsible for reviewing model assumptions, and are these individuals sufficiently independent from the process itself? Does management also engage in sensitivity analyses to determine the impact interest-rate fluctuations will have on expected fallout levels?

2. Determine to what extent management uses output from these models in business planning, financial management, and budgeting.

3. Assess the degree to which mortgage banking activities are incorporated into the parent company's asset/liability management reports and program.

Hedging Practices

1. Discuss management's philosophy and strategy to determine the amount of interest-rate risk they are willing to accept. How successful has the company's marketing strategy been over the past few years and how is it changing? What are management's primary sources of market information? Are sources sophisticated enough given the size of the company and the scope of its activities?

2. Review the marketing policy to determine products and strategies used to hedge the interest-rate risk associated with inventory loans and rate-locked loan applications in the pipeline. Review actual hedging practices to determine whether they conform with established policy limitations and guidelines. What percentage of closed loans held in inventory and loan applications in the pipeline are matched against specific investor commitments? How are coverage levels determined and how have they changed over time? Is the basis for this coverage ratio adequately documented? Determine whether the current coverage ratio exposes the company to undue risk associated with potential marketing losses.

3. Determine the adequacy of management's strategies for hedging loans that have special risks (ARMs with interest-rate caps and floors).

4. Ascertain if basis risk exists for any hedging products, whether such risks are significant, and the impact on correlation. How is basis risk identified, monitored, and controlled?

5. Determine whether call options are written to enhance inventory yields. If so, verify that they are written against covered positions. Determine whether management is speculating in any way and whether this activity subjects the company to undue risk.

6. Obtain profit/loss reports on hedging activities. How frequently are they prepared, how are they used, and to whom are they distributed? Evaluate the financial results of the hedging program over the past three years. Is management taking on excessive risk to record profits in this area?

7. Review management reports relating to pipeline and closed-loan hedging operations. Determine whether such reports are complete, accurate, and timely. Do such reports adequately limit excesses, record exception approvals, and detail risk exposures?

8. Review information provided to executive management and the board to determine whether hedging practices are adequately supervised.

Counterparty Risk

1. Review the marketing committee's list of approved brokers and dealers. Have appropriate dealer limits been established and are such limits adhered to? How are exceptions monitored, reported, and controlled?

3070.0.4 SERVICING/LOAN ADMINISTRATION

Mortgage banking companies that originate and sell residential real estate loans in the secondary market often retain the right to service those loans for the investor for a fee. In return, the servicer collects monthly payments from mortgagors, collects and maintains escrow accounts, pays the mortgagors' real estate taxes and insurance premiums, and remits principal and interest payments to the ultimate investors. The servicer also maintains records for the mortgagor, collects late payments on delinquent accounts, inspects property, initiates and conducts foreclosures, and submits regular reports to investors. Such functions and responsibilities should be documented within a formal written servicing agreement.

3070.0.4.1 Revenue Generation

The right to service mortgage loans provides a stable source of earnings and the potential for one-time gains. For this reason, servicing portfolio growth has become a primary objective for many mortgage banking companies.

Mortgage-servicing revenues are derived from six sources. The primary source is the contractual servicing fee. Because this fee is usually expressed as a fixed percentage of each outstanding mortgage loan's principal balance, servicing-fee revenues decline over time as the loan balance declines.

The second source of servicing income arises from the interest that can be earned by the servicer from the escrow balance that the borrower often maintains with the servicer for the payment of taxes and insurance on the underlying property. This income may vary, however, as some states require that interest payments on escrow balances be paid to the borrower.

The third source of revenue is the float earned on the monthly loan payment. This opportunity for float arises because of the delay permitted between the time the servicer receives the payment and the time that the payment must be remitted to the investor.

The fourth source of revenue consists of income late fees charged to the borrower if the monthly payment is not made on time. A fifth source is income in the form of commissions that many servicers receive from cross-selling credit life and other insurance products to the borrowers. The sixth and last source is when the servicer might generate fee income by selling mailing lists to third parties.

3070.0.4.2 Cost Containment

Long-term profitability is achieved through cost containment, technological improvements, and economies of scale, which reduce the per-unit cost of servicing. Servicing costs vary widely across institutions depending on portfolio characteristics such as product type, loan size and age, delinquency status, and foreclosure statistics. Nevertheless, two efficiency measures frequently used within the industry to measure cost containment are unit-servicing costs and the number of loans serviced per employee. The minimum size of a loan-servicing portfolio needed to achieve economies of scale varies across institutions and depends on portfolio characteristics and the servicer's expertise and technological capabilities.

Servicing data are available through the Mortgage Bankers Association's publication, ''Mortgage Banking Performance Report.'' Based on detailed financial-statement information from a sample of companies, the report presents a compilation of performance data on all aspects of the mortgage banking industry.

3070.0.4.3 Growth Strategies

Many companies have established aggressive growth targets for their servicing portfolios. The size of the portfolio may be increased through originations, purchases of loans (individual or bulk), or purchased servicing rights. Portfolio size is reduced through normal runoff, prepayments, and sales of either loans or servicing rights only. Management's growth strategy should be examined in light of its expertise and systems capabilities.

3070.0.4.4 Servicing Agreements

The servicer generally operates under a written contract with each investor. This contract, also known as a servicing agreement, establishes minimum conditions for the servicer such as its fiduciary responsibilities, audit requirements, and fees. Contracts may be standardized or tailored to the individual investor.

Under most servicing agreements, the servicer warrants that full principal has been advanced, the mortgage is in fact a first mortgage on the property, and that the first mortgage position will be maintained by the servicer. Additional warranties that are either unwritten or implied may create significant exposure for the servicer.

A servicer may also enter into an agreement with another company to subservice certain loans or portfolios of loans. The company's method of evaluating and monitoring the financial condition of its subservicers should also be reviewed. Servicing and subservicing agreements should be evaluated in terms of the subservicer's responsibilities, reporting requirements, performance, and fees. They should also be reviewed to determine that no additional liabilities, real or contingent, are imposed upon the company beyond its responsibilities as a servicing agent.

3070.0.4.5 Recourse Obligations

A servicing agreement may contain specific recourse obligations that go beyond the servicer's customary fiduciary obligations. A mortgage banking company can choose to service loans for investors either with or without recourse back to the mortgage banking company. Servicing agreements should be reviewed to determine the extent of any recourse obligations. The risk of recourse should also be discussed with management to assess whether the risk is being identified and effectively managed.

The degree of recourse varies by investor. FannieMae offers either ''regular'' or ''special'' servicing options. With FannieMae's regular option, the servicer retains all risk of loss from mortgage default. With FannieMae's special servicing option, the mortgage banking company only retains exposure for normal representations and warranties. FHLMC offers similar servicing options. FannieMae and FHLMC generally limit eligibility for the regular servicing option to participants with the knowledge and financial wherewithal to make good on their recourse obligations.

GNMA servicing carries no contractual recourse. However, in the event of mortgage default, the servicer may have exposure to principal loss and other nonreimbursable expenses, particularly with respect to VA-guaranteed loans. If a borrower defaults on a VA-guaranteed loan, the VA can exercise a ''no-bid'' put option, which allows the VA to pay out its guaranty and leave the property with the servicer for disposition.

When a borrower defaults on a VA-guaranteed loan, the VA makes a calculation that will guide its decision to accept or reject conveyance of the property. The VA's decision to exercise its no-bid option is based on the net value of loan collateral and the VA's guaranteed percentage of the indebtedness. The mortgage servicer, at its option, could pay down the outstanding principal balance on the loan to a point where the VA would not be expected to exercise its no-bid option. Such ''buydowns'' result in additional foreclosure losses for the servicer.

The risk-based capital guidelines require a charge to capital when any risk of loss is retained on such recourse obligations. The charge would be at the bank holding company, the bank, or both,[3] depending on ownership of the risk. For this reason, the accuracy of reported recourse obligations should be verified.

3. If at the bank, then it is also consolidated at the bank holding company level.

3070.0.4.6 Guaranty Fees

The amount of guaranty fee the mortgage banking company pays the government-sponsored agencies (or private issuer) is negotiated. Guaranty fees vary based on the amount of recourse assumed by the mortgage banking company (the servicer) and the timing of the cash flows. A smaller guaranty fee is negotiated when the guarantor assumes less risk or receives payments sooner in the remittance cycle. Remittance cycles vary by investor.

The examiner should discuss with servicing personnel the amount of risk that has been taken on by the marketing department in exchange for reduced guaranty fees. Excessive risk accepted by the mortgage banking company should be incorporated into the assessment of management.

3070.0.4.7 Internal Controls

The servicing process begins after the post-closing review has been completed and the loan has been set up on the mortgage banking company's servicing computer system. Servicers are responsible for adequately safekeeping loan documents. Documents must be stored in a secured and protected area such as a fireproof vault. Servicers must also maintain a tracking system for following up on missing documents.

The control environment that sets the tone of a servicing department's operation should be assessed. A servicing department's management faces a variety of risks that it should identify and control. In addition to identifying and controlling risks, management also needs to institute adequate and effective internal controls to match a servicing portfolio's growth and the department's technological changes. When assessing the control environment, the examiner needs to consider the extent to which management uses internal and external audits, quality control reports, and investor audits to ensure that its policies and procedures are followed.

The servicer's performance should be evaluated, with any loss of servicing due to operating inefficiencies or excessive risk-taking discussed and noted. A discussion of the risks within each operational area, as well as the management reports and internal controls, follows.

- *Loan accounting*. Incoming payments may be processed in-house, through a lockbox, or through some combination of both. Payments are deposited into a clearing account and then transferred to the respective investor custodial bank accounts the next day. Investor remittances may be required daily, weekly, monthly, or as funds are received. In certain cases, servicing agreements may specify that payments be sent directly to security holders. Numerous accounts through which incoming and outgoing payments pass should be reconciled daily to avoid costly processing errors. The reconcilement process should be reviewed with management to ensure that reconcilements are performed on a timely basis and without chronic discrepancies.

- *Escrow administration.* In addition to receiving and remitting payments, servicers are also responsible for paying taxes and insurance on the underlying property. Accurate information must be maintained for each loan regarding a legal description of the property; the appropriate taxing authority, due dates, and amounts for taxes owed; and the insurance provider and due dates and amounts for insurance owed. Failure to maintain such information may result in missed tax and insurance payments on the property, which may lead to penalties and/or lapsed insurance coverage. The servicer's record of tax penalties paid over the past several years should be reviewed to determine whether a problem exists in this area.

  Escrow account balances should be adequate to meet expected tax and insurance obligations. If the servicer advances its own funds to cover an escrow overdraft, such payments may be capitalized and recorded as a receivable only if the servicer is to be reimbursed by either the mortgagor or the investor. Escrow receivables should be aged, with stale or otherwise uncollectible receivables charged off.

  Escrow accounts should be analyzed at least annually, with a copy of the analysis sent to the mortgagor. Shortages (overdrafts) may be billed or spread out over 12 months. Overages should be returned to the borrower or handled in a manner consistent with federal and state laws and regulations. For loans that were set up without an escrow account, the examiner should verify that adequate information has been obtained from the mortgagor to ensure that taxes and insurance are current.

- *Investor reporting.* Investor remittance and reporting requirements vary greatly. Remittances are contractually arranged. In some instances, the servicer may be required to advance to investors funds that have not yet been received from the mortgagor (for example, cash advances to ensure timely payment of principal and interest). In such cases, a receivable is created on the balance sheet. Receivables relating to investor remittances should be aged in the same manner as escrow receivables and periodically reviewed by a supervisor. Stale or otherwise deemed uncollectible receivables should be periodically charged off in a timely manner.

  Investor reports should include detailed account reconciliations and information on the mortgagor's name, principal balance outstanding, escrow balance, delinquency status of the account, and any foreclosure activity or transfer to the servicer's other real estate owned account. The quality and accuracy of investor reporting should be periodically reviewed by internal or external auditors.

- *Collections, foreclosures, and other real estate (ORE).* Investor requirements also vary concerning contact with delinquent borrowers, forbearance policies, and reimbursement for foreclosure expenses, ORE write-downs, and related losses. Detailed policies concerning collection efforts and foreclosures should be in place and followed. The property should be inspected regularly to ensure that its condition is adequately monitored. Delinquency and foreclosure statistics should be tracked by product type and originator.

  Foreclosures are generally initiated after three full installments are due and unpaid. The servicer notifies the mortgagor of its intent in writing and refers the case to an attorney. Detailed records should be maintained for all expenses that are incurred. If the loan is insured, claims may ultimately be filed against the FHA, VA, or private mortgage insurance (PMI) company. However, it should be noted that certain interest expenses and collection or foreclosure costs are not reimbursable.[4] These expenses are a cost of doing business that must be factored into the servicing fee charged for providing these services.

  The timeframe for taking title on foreclosed property varies widely and is determined by state law. *Once title is taken, the property should be classified as ORE.* Although

4. For a detailed list of both reimbursable and nonreimbursable expenses, see the agency seller/servicer guides.

all ORE is generally managed through a centralized unit, for accounting purposes, ORE may fall into one of two distinct categories: ORE that is owned by the mortgage banking company, and ORE that is serviced on behalf of the investor. ORE that is owned should reconcile to the balance sheet, whereas ORE that is serviced for others is an off-balance-sheet item. ORE appraisal, valuation, and financing policies should be consistent with regulatory policy. In-substance foreclosures and any troubled debt restructurings should be properly identified and accounted for.

- *Payoffs*. Loans are considered ''paid off'' when the loan matures, the loan is refinanced, or the property is sold. Prior to payoff, the servicer is responsible for sending payoff instructions to the mortgagor. After a loan has been paid off, the servicer makes a satisfaction remittance to the investor or the pool; obtains documentation; cancels the note; and forwards the satisfied mortgage documentation plus an escrow refund check, if applicable, to the mortgagor. A high level of refinance activity may strain payoff personnel's ability to perform this obligation accurately and promptly. Management reports should monitor the level of payoff activity and alert supervisors to operational backlogs, the need to hire temporary personnel, or the need to outsource work to third parties.
- *Customer service*. Poor service may damage the mortgage banking company's business reputation (reputation risk) and ability to originate, sell, and service loans within the community. Because of name recognition, problems in this area may also adversely affect affiliate banks or the bank holding company and its nonbank companies.

  For this reason, servicers should maintain an adequate system for logging, tracking, and responding to customer inquiries and complaints. Management reports should track the volume and disposition of such inquiries and complaints. Inordinate volumes of complaints may be an indication of operational backlogs, inefficiencies, or mishandling of accounts. If this occurs, corrective measures should be initiated immediately.

3070.0.4.8 Data Security/Contingency Planning

The servicing system should be of a complexity and size necessary to accommodate both the current and the projected volume of transactions. Examiners should obtain information on the servicing system in use and any limitations it might pose in terms of future growth plans.

Procedures for maintaining physical security in the workplace, data security, and file backup also should be discussed with management. A contingency plan should describe the use of alternative backup sites, as well as procedures that would be followed to reconstruct altered or destroyed files. Contingency plans should be reviewed and approved at least annually and tested regularly.

3070.0.4.9 Inspection Objectives—Servicing/Loan Administration

1. To assess the adequacy of management oversight of risk through policies and procedures, management information systems and reports, and other internal and external audits, with respect to the following:

- collecting monthly payments from mortgagors
- reporting loan activity and remitting funds to investors
- monitoring escrow account balances
- disbursing property insurance and real estate tax payments
- monitoring delinquencies, initiating collection activities, and initiating foreclosure proceedings in a timely manner

2. To evaluate the level of risk assumed by the mortgage banking company through servicing recourse arrangements.

3070.0.4.10 Inspection Procedures—Servicing/Loan Administration

Management Assessment

1. Obtain an organization chart for the servicing department and resumes for senior management and key staff members. Evaluate management's qualifications and expertise.
2. Review servicing policies and procedures manuals to determine whether reasonable operating standards have been established for each functional area. Also assess whether management reports adequately monitor compliance with established policies and procedures. Determine how exceptions are identified and addressed.

3. Review internal and external audits, quality control reports, and investor audits to determine whether internal controls are functioning effectively.

4. Evaluate safeguards in place for loan documents and determine if an adequate document tracking system exists.

5. Verify that a disaster recovery plan is in place that covers all in-house servicing functions. Verify that backup systems exist should primary systems fail. Determine if backup systems would provide information to substantiate servicing portfolio asset values.

6. Obtain a list of subservicers and vendors, if any, employed to perform servicing functions.

- Determine if a periodic review of services provided by each subservicer is conducted. In addition, the financial condition of each subservicer should be evaluated at least annually.
- Determine whether a contingent operating plan has been established should subservicers and vendors be unable to perform their contractual obligations.

Profitability Analysis

1. Review business line profitability for the servicing department to identify significant trends and/or areas of potential weakness. Discuss and review key efficiency measures such as unit cost and cost per employee.

2. Analyze servicing income and expenses to determine whether operations are profitable and economies of scale are being achieved in line with industry norms:

- Determine whether all direct and indirect costs are included.
- Compare servicing revenues with costs.
- Assess the impact of any bulk servicing purchases or sales on departmental profitability.
- Analyze efficiency in light of management's growth projections.

3. Review servicing portfolio trends and characteristics, including the following:

- investors (GNMA, FannieMae, FHLMC, private)
- recourse provisions
- loan types (30-year fixed, 15-year fixed, ARM, balloon)
- average loan size
- interest rates (particularly those above market)
- remaining contractual life
- projected life
- geographic distribution of mortgagors
- delinquency statistics
- foreclosure statistics
- number of subserviced loans and servicers

Loan Accounting

1. Review with management the procedures for receiving payments from mortgagors and depositing funds into segregated accounts. Determine that the segregation of duties and other controls over custodian accounts are adequate.

2. Review any outstanding advances to investors. Evaluate the collectibility of advances, the timeliness of charge-offs, and the adequacy of reserves.

3. Determine whether outstanding items related to investor account reconciliations are being resolved in a timely manner. Are reconciliations routinely reviewed and approved by a supervisor?

Escrow Administration

1. Review with management the system in place for ensuring the timely payment of taxes, insurance, and other obligations.

2. Review the servicer's method for analyzing the amount and adequacy of escrow account balances, and evaluate its effectiveness. Assess procedures relating to shortages and overages in escrow accounts:

- Determine whether procedures comply with 12 U.S.C. 2609 (RESPA) and to the extent possible with state laws.
- Determine whether the borrower is sent an analysis statement showing the amount of discrepancy, how it occurred, and an explanation of how it is to be corrected.

3. Determine the volume of loans with no escrow requirement and procedures for ensuring that insurance payments and taxes are current.

4. Determine how escrow funds are invested, assess the appropriateness of the investment vehicles, and review management's analysis of yield on escrow funds.

5. Evaluate whether controls are in place to prevent the use of escrow custodial accounts to meet other obligations.

6. Review outstanding escrow advances, and determine if claims for reimbursement are processed in a timely manner. Evaluate the collectibility of outstanding advances and verify that uncollectible advances are charged off in a timely manner.

Investor Reporting

1. Review the list of investors for which servicing is performed.

2. Review servicing contracts to verify that signed, current contracts exist. Discuss with management the nature of any recourse provisions, forbearance requirements, and nonreimbursable collection and/or foreclosure expenses.

3. Review the most recent investor audit reports on the servicing function. Discuss findings with management and evaluate the adequacy of any actions taken to correct deficiencies.

4. Determine whether any servicing contracts have been terminated for cause or are likely to be lost in the near future. Determine the reason for any termination and the extent of any corrective actions taken.

Collections and Foreclosures

1. Review and assess, on a statistical-sample basis, the accuracy and adequacy of loan delinquency reports by product type and originator. Ascertain the reasons for poor or declining asset quality within the servicing portfolio.

2. Review policies and procedures for collecting late payments.

- Determine when collection efforts start once an account becomes delinquent.
- Verify that all attempts at collecting past-due payments are documented, including each date of communication with borrowers, the nature of the communications, and the customers' replies.

3. Select a sample of files for borrowers who are 120 days or more delinquent and determine whether foreclosure proceedings are instituted in a timely manner.

- Determine if borrowers and investors are appropriately notified of the initiation of foreclosure action.
- Verify that contacts with borrowers are documented.
- Determine whether property inspections are conducted in accordance with policy.
- Verify that foreclosure practices comply with FHA/VA/PMI requirements and guidelines.

4. Determine the average foreclosure costs for each product type. Foreclosure costs include inspections, legal and administrative costs in excess of those defined as normal and customary, VA no-bid, and VA write-downs.

5. Obtain a list of loans in foreclosure in which action has been delayed, and determine if the justifications for delay are reasonable.

6. Determine the number and dollar volume of delinquent loans that were purchased from the servicing portfolio (buyouts or buybacks).

- Assess the impact of repurchases on profitability, the appropriateness of this practice, and the accounting procedures for these loans.

7. Discuss with management the effect that negotiated guaranty fees may have on the level of losses associated with foreclosures.

Payoffs

1. Review procedures for payoffs to determine whether—

- payoff instructions are sent to the mortgagor before payoff;
- satisfaction remittances are made to the investor or to the pool, necessary documentation is obtained, notes are canceled properly, and documentation plus any escrow refund checks are sent to the mortgagor in a timely manner; and
- internal controls are in place to ensure that funds are not misappropriated and employee fraud is detected and reported according to policy.

Other Real Estate

1. Determine the number and dollar volume of ORE by geographic location.

- Compare the volume of ORE with historical levels and the industry average for similar-sized servicers.

- Evaluate the impact of ORE on profitability.
- Review the policies and practices for ORE accounting, property supervision, and marketing. Verify that policies are consistent with investor guidelines and regulatory policies.

2. Determine whether ORE parcels are purchased from the servicing unit by the bank holding company or its affiliates.

- Evaluate the controls in place to limit or prevent this practice and the accounting treatment for such loans.
- Verify that information regarding ORE is properly reported to the parent bank or holding company for consolidation into regulatory reports.

Customer Service

1. Review the system for logging, tracking, and responding to customer complaints. Has the volume of complaints grown? Are complaints addressed promptly with any problems resolved in a timely manner?
2. Review the servicer's customer-complaint file to gain more insight into the nature of the complaints. Do complaints suggest that internal policies and procedures are not being followed or that staffing levels are inadequate?

3070.0.5 FINANCIAL ANALYSIS

This section provides the examiner a framework with which to analyze the financial condition of a mortgage banking company. The analysis begins with a review of the mortgage company's balance sheet and income statement. The financial analysis should incorporate a review of primary balance-sheet and income-statement levels and trends, off-balance-sheet assets and liabilities, asset quality, market share and earnings performance, funding sources, liquidity needs, and capital adequacy. Any problems or conditions that expose the mortgage banking company, affiliate banks and nonbanks, and/or its parent bank holding company to undue financial risk should be brought to management's attention and documented in page one, Examiner's Comments and Matters Requiring Special Board Attention. The examiner should focus on items that are either large relative to the company's operations or that may pose undue financial risk. The examiner should also investigate any trends that appear inconsistent with the mortgage banking company's industry peer group, business orientation (such as wholesale versus retail, originations versus servicing, etc.), and future growth plans or with the current economic and interest-rate environment.

Financial-statement presentation may vary across mortgage banking companies. If questions arise, financial-statement presentation and accounting should be reviewed with the company's internal and/or external accountants for propriety. During the review of the financial statements, the examiner should establish whether regulatory reports are prepared accurately. Banks must conform to the reporting requirements of the Commercial Bank Reports of Condition and Income (call report). Bank holding companies and their direct subsidiaries must conform to generally accepted accounting principles (GAAP). Relevant GAAP statements of the Financial Accounting Standards Board include SFAS No. 65, "Accounting for Certain Mortgage Banking Activities," as amended; SFAS No. 91, "Accounting for Nonrefundable Fees and Costs Associated with Originating or Acquiring Loans and Initial Direct Costs of Leases"; SFAS No. 115, "Accounting for Certain Investments in Debt and Equity Securities"; SFAS No. 125, "Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities;" and SFAS No. 80, "Accounting for Futures Contracts." Other relevant accounting pronouncements are identified in appendix B, Accounting Literature.

The financial analysis should also include an assessment of asset quality, earnings, liquidity and funding, and capital. Any problems or conditions that expose the mortgage banking company, affiliate banks and nonbanks, and/or the parent bank holding company to undue financial risk should be brought to management's attention and discussed in the Examiner's Comments and Matters Requiring Special Board Attention.

3070.0.5.1 Balance Sheet

3070.0.5.1.1 Assets

The asset side of the balance sheet may consist of cash, reverse repurchase agreements, marketable securities, receivables and advances, mortgage loans held for sale, mortgage loans held for investment, mortgage-servicing assets (MSAs) (including mortgage-servicing rights), reserves for loan and other credit-related losses (contra accounts), other real estate owned (OREO), and other assets.

3070.0.5.1.1.1 Mortgage-Related Securities

The examiner should determine whether the accounting treatment for mortgage-related securities reported on the balance sheet is consistent with SFAS 115. SFAS 115 applies to equity securities having readily determinable fair values and to all debt securities. It does not apply to loans purchased.

Under SFAS 115, at acquisition and at each subsequent reporting date, all debt and equity securities that fall under the scope of the statement should be classified into one of the following categories:

- trading securities
- available-for-sale securities
- held-to-maturity securities

Both debt and equity securities can be assigned to the above first two categories. The third classification can only consist of debt securities.

Trading. Mortgage-backed securities that are held for sale in conjunction with mortgage banking activities should be classified as trading securities and reported at fair value. Debt securities not held to maturity and equity securities that have readily determinable fair values should be classified as trading securities when (1) they are held for short periods of time and (2) they have been acquired with the expectation of a profit from short-term price differences. Securities that are actively traded should be carried at fair value on the balance sheet, with net unrealized gains or losses included in income.

Available-for-sale. Debt and equity securities having readily determinable fair values that are not otherwise classified, as above, should be categorized as available-for-sale and carried at fair value on the balance sheet. Unrealized holding gains and losses should be reported in a separate component of shareholders' equity and should not be included in income.

Held-to-maturity. For a security to qualify as held-to-maturity under SFAS 115, the mortgage banking company must demonstrate the positive intent and ability to hold it until maturity.

3070.0.5.1.1.2 High-Risk Securities

The examiner should also review any high-risk mortgage securities that are on the balance sheet, such as collateralized mortgage obligations (CMOs), real estate mortgage investment conduits (REMICs), CMO and REMIC residuals, and stripped mortgage-backed securities (stripped MBSs). See sections 2126.1 and 2190.0.5.

3070.0.5.1.1.3 Mortgage Loans Held for Sale

The examiner should determine whether the accounting treatment for mortgage loans held for sale is consistent with SFAS 65, as amended. Mortgage loans held for sale shall be reported at the lower of cost or market value, determined as of the balance-sheet date.[5] The amount by which the cost exceeds market value shall be accounted for as a valuation allowance. Changes in the valuation allowance shall be included in net income of the period in which the change occurs.

3070.0.5.1.1.4 Mortgage Loans Held for Investment

Mortgage loans held for investment may include loans that (1) do not meet secondary-market guidelines and are therefore unsalable, (2) loans that were repurchased from an investor due to poor documentation and/or improper servicing, (3) loans put back to the mortgage banking company under recourse agreements, and (4) loans intentionally originated for portfolio.

SFAS 65 states that a mortgage loan transferred to a long-term investment classification shall be transferred at the lower of cost or market value as of the transfer date. The securitization of a mortgage loan held for sale shall be accounted for as the sale of the mortgage loan

5. According to SFAS 65, as amended, the capitalized costs of acquiring rights to service mortgage loans, associated with the purchase or origination of mortgage loans, shall be excluded from the cost of mortgage loans for the purpose of determining the lower of cost or market value.

and the purchase of an MBS classified as a trading security at fair value. Any difference between the carrying amount of the loan and its principal balance shall be recognized as an adjustment to yield by the interest method.

A mortgage loan shall not be classified as a long-term investment unless the mortgage banking company has both the intent and the ability to hold the loan for the foreseeable future or until maturity. If the ultimate recovery of the carrying amount of the loan is doubtful and the impairment is considered to be other than temporary, the carrying amount of the loan shall be reduced to its expected collectible amount, which becomes the new cost basis. The difference is recognized as a loss. A recovery of the new cost basis shall only be reported as a gain upon sale, maturity, or disposition of the loan.

3070.0.5.1.2 Liabilities

The liability side of the balance sheet may include repurchase agreements, commercial paper, revolving warehouse lines of credit, long-term debt instruments, intercompany payables, and equity capital.

3070.0.5.1.2.1 Repurchase Agreements

A mortgage banking company may finance its mortgage loans or MBSs held for sale by transferring mortgage loans or MBSs temporarily to banks, nonbanks, or other financial institutions under formal repurchase agreements that indicate that control over the future economic benefits relating to those assets and the risk of market loss are retained by the mortgage banking company.

Repurchase agreements can provide a cost-effective method of holding mortgage-backed securities before their sale to investors. Securities dealers repo the securities for a period of 30 to 180 days at a substantial cost advantage to warehouse facilities. Repurchase agreements involve delivery of the security to the dealer with an agreement to repurchase it on a specified date. Upon receipt, the dealer wires the haircut proceeds to the mortgage company. The mortgage company then reduces the amount of its outstanding warehoused loans. If the repo is being handled by the dealer that is arranging the ultimate sale of the security, the amount of that discount should approximate the discount on the sale. If another dealer is involved in the ultimate sale, the haircut may be greater because the security must be repurchased and redelivered to the second dealer. This may also require a rehousing to provide funds to honor the repurchase commitment. Most warehouse lenders allow traditional warehouse lines to be collateralized by individual mortgages and mortgage-backed securities.

A mortgage banking company may use repurchase agreements in conjunction with sales of loan pools. The company may use repurchase agreements to pledge mortgage loans and/or MBSs as collateral for borrowings. In return, it receives advanced funds against future deliveries. The lenders are repaid through the sales of MBSs. The amount outstandings bear interest for the number of days the funds are outstanding.

Under repurchase agreements, the same loans or MBSs are generally reacquired when they are sold to permanent investors. Mortgages or MBSs may also be transferred temporarily without a repurchase agreement. However, some type of informal agreement generally exists. Mortgage loans and MBSs held for sale that are transferred under either formal or informal repurchase agreements shall be accounted for as collateralized financing arrangements and reported as either mortgage loans held for sale or MBSs classified as trading securities on the mortgage banking company’s balance sheet.

3070.0.5.1.2.2 Commercial Paper

Another source of short-term funding is the issuance of commercial paper. In general, commercial paper represents unsecured notes with maturities up to 270 days from the date of sale. Because of its short maturity, proceeds should be limited to current transactions with short-term maturities. Commercial paper proceeds should not be used to fund loans held for sale for a period greater than one year.

Commercial paper can be less reliable than warehouse lines of credit. If commercial paper funding is used, examiners should review related commercial paper backup lines of credit and ratings issued by credit rating agencies. The reason for any rating changes during the prior year should be investigated. Additional guidance on this topic is set forth in sections 2080.05, 2080.1, and 5010.23.

3070.0.5.1.2.3 Revolving Warehouse Lines of Credit

Short-term revolving warehouse credit lines are often used to fund loans held for sale, which is generally the largest asset on the company's balance sheet. Revolving credit lines may be obtained from an affiliate bank, the parent bank holding company, or an unrelated third party.

The extension of credit for a particular loan is paid off when the mortgage lender sells the mortgage loan to a government-sponsored agency such as GNMA, FannieMae, or FHLMC or to a private investor. Lenders who provide warehouse lines of credit typically enter into a warehouse credit agreement with the borrower. Under the agreement, the warehouse lender agrees to extend credit to the mortgage banking company for the purpose of originating loans. The mortgage banking company agrees to repay each extension of credit within the terms of the agreement. Each extension of credit is secured by placing a lien on the originated mortgage loan. The warehouse lender perfects its security interest by taking possession of the original promissory note executed by the borrower, endorsed ''in blank,'' together with an assignment of the mortgage securing the loan. To further protect its security interest, the warehouse lender usually takes the responsibility of delivering the loan package to the secondary market investor for purchase. The investor, in turn, delivers the purchase price of the mortgage directly to the warehouse borrower (mortgage banking company). Each portion of the warehouse line may be priced separately to reflect various levels of risk and the documentation requirements of each.

The details of all credit lines should be specified in formal, written credit agreements. Revolving credit lines may be either unsecured or secured by a lien on the underlying mortgages. Under most secured lines, a formula is used to calculate the borrowing base, which generally consists of cash, cash equivalents, loans held for sale, securities, and a percentage of the mortgage-servicing portfolio less certain short-term indebtedness. Some credit lines require the maintenance of compensating balances.

Internal credit arrangements (conducted either by a mortgage banking subsidiary of a bank or bank holding company) must comply with sections 23A and 23B of the Federal Reserve Act. See sections 2020.1 and 3070.0.7 of this manual.

Examiners should evaluate the adequacy and efficiency of warehouse funding operations. The examiner should determine whether the warehouse lender is of a sufficient size and whether it is well positioned financially to provide adequate lines of credit, as needed. Examiners should ascertain whether funding must be regularly derived from more than one warehouse lender (including whether the warehouse line has to be participated out to other lenders) and whether the lender has proper internal controls to safeguard collateral documents for pool certification. The examiner should also determine what management's contingency plans are for the use of alternative financing sources beyond standard warehouse lines of credit for backup financing and lower-cost efficiency purposes. Has management (1) explored variations in existing lines of credit to reduce overall borrowing costs and (2) determined what competitor lenders are paying for similar financing facilities?

Procedures should be in place to monitor compliance with all short-term debt covenants. Covenants may limit servicing of loans with recourse, limit total debt to specified levels, and/or require minimum tangible net worth, leverage, and current ratios. Most credit agreements also limit the borrower's financial flexibility if the company's long-term debt ratings decline or the company becomes unrated or if certain events occur related to securities.

3070.0.5.1.2.4 Long-Term Debt

Longer-term assets are more appropriately funded through the issuance of longer-term liabilities or capital. Toward this end, mortgage banking companies may issue medium- or long-term public debt securities (including warrants to purchase debt securities). Debt may be issued in the form of fixed-rate or floating-rate notes with various repayment or redemption terms. Loan agreements should specify all relevant terms and conditions and may contain debt covenants similar to those found in the warehouse funding arrangements.

Long-term debt may incorporate restrictive covenants which limit the company's activities in certain respects. These covenants may set limits on the amount of senior debt outstanding and the minimum amount of liquid net worth (as defined by the documents), and may limit the proportions of specific categories of assets. Such covenants should be reviewed to make certain that they are not too restrictive and that they permit financial flexibility.

3070.0.5.1.3 Equity Capital

Funding is also provided through equity capital, which may be supplemented by capital contributions from the parent company or the direct issuance of equity securities.

3070.0.5.2 Income Statement

Mortgage banking revenues generally consist of the following: loan servicing/administration revenue; loan-origination-fee revenue; interest income; gains (losses) on the sale of mortgage loans, mortgage securities, or mortgage-servicing rights; and management and other fee income. The examiner may find that gross gain (loss) on the sale of mortgage loans or securities is reported on the income statement net of loan-origination fees and direct loan-origination costs such as personnel and office expenses.

Expenses may include interest expense; salaries, commissions, and other personnel costs; interest losses on MBS pools; amortization of mortgage-servicing assets and any other purchased intangible assets; electronic data processing and other selling, general, and administrative costs; occupancy and equipment; depreciation; provision for foreclosure and other loan losses; and a provision for income taxes. Some companies net amortization of MSAs directly against loan-servicing revenues.

3070.0.5.3 Unique Characteristics

The financial analysis should reflect certain operational characteristics that are unique to the mortgage banking industry. Many of these characteristics are cyclical based on interest rates and economic conditions.

For example, the cost of funding loans in the warehouse is relatively inexpensive during periods of low interest rates, but may increase significantly as interest rates rise. Marketing operations are also highly dependent on the interest-rate cycle. During periods of falling interest rates, the company may experience substantial gains on the sale of mortgage loans and securities to permanent investors. Alternatively, during periods of rising interest rates, the company will usually experience losses on the sale of mortgages and securities. Interest-rate volatility can cause large fluctuations in warehouse funding costs and marketing gains and losses.

The examiner should also consider the impact of current economic conditions on the size and composition of the mortgage banking company's balance sheet. When the economy expands, loan volume increases and the overall size of the balance sheet tends to grow. During recessions, the balance sheet should contract, reflecting the lower demand for new loans. Management's planning efforts should incorporate this type of economic trend analysis in their growth targets. Steady annual growth may or may not be anticipated.

Efficiency measures, such as activity ratios (inventory turnover and efficiency ratios), should be used to determine management's ability to originate and sell loans efficiently. The inventory of loans held for sale is transitory, lasting between 45 to 60 days. A buildup of loans on the balance sheet may indicate processing delays and/or asset-quality problems that may prevent their ultimate sale to permanent investors. Because of the transitory nature of the balance sheet, traditional leverage ratios (asset-to-equity capital) may not be meaningful and should be used sparingly.

Another unique characteristic of a mortgage banking company is the economic value of its mortgage-servicing operations, which constitutes an off-balance-sheet item. Failure to incorporate this economic value into the financial analysis may overstate the degree of financial leverage that is employed within the company.

3070.0.5.4 Asset Quality

The quality of assets that are on the balance sheet is evidenced by the following: compliance with original underwriting standards; the existence of effective loan review and quality control programs; borrower payment and agreement performance; the fair value of MBSs held for sale or investment; the collectibility, independent valuation, nature, volume, and existence of recorded assets; the application of GAAP in accounting for the assets; and the degree of protection afforded by real estate mortgage collateral, including any private mortgage insurance. The value afforded by real estate mortgage collateral includes the extent of compliance with the Federal Reserve Board's real estate appraisal regulations and guidelines. (See section 2231.0.) Asset quality should be analyzed in terms of regional and national economic factors as well as portfolio and managerial factors.

For any review of any loan portfolio, a sampling of real estate appraisals should be included to determine whether the appraisal results reasonably support the amount loaned. If the property appears to be overappraised or if there is a problem with the appraisal (for example, the appraisal is obsolete or the validity of the appraisal is in question), the examiner should consider recommending that a new appraisal be performed.[6] It may be necessary for the examiner to classify the loan (i.e., as a loss) and for the parent holding company to increase its allowance for loan and lease losses.

Bank holding companies and/or their nonbank subsidiaries should be criticized if initial appraised values appear to be inadequate and/or not properly supported by proper documentation. If corrective action is not taken by management, formal enforcement action should be considered. Such actions may require the bank holding company to revamp its appraisal activities and/or collection procedures and, if warranted, to retain the services of an independent appraiser to conduct an evaluation of loan collateral.

With respect to MBSs, the quality characteristics of the underlying mortgage collateral should be considered. If the securities are backed by GNMA, FannieMae, or FHLMC, the rating agencies consider such securities to be the highest quality asset because of their linkage to the federal government. If the collateral consists of unsecuritized mortgages, the examiner should consider the geographic dispersion, type of mortgage and property, underwriting standards, and term to maturity of the underlying pool of mortgage loans. External factors can affect the value of mortgage securities directly, such as the default or downgrading (by a credit rating agency) of a private mortgage insurer.

To a large extent, insurance and guaranties provided by government-sponsored agencies and other third parties (for example, private mortgage, bankruptcy protection, fraud, and mortgage pool insurers, as well as performance bond insurers and other guarantors) mitigate credit risk for an originator; however, the originator still remains responsible for the quality of loans sold to investors for at least the first 90 days, as well as for any loans sold under recourse arrangements. As a servicer, the company also can be held liable if it does not initiate collection and foreclosure actions in strict accordance with investor-servicing agreements. In addition, certain interest losses and expenses relating to collections, foreclosure, and ORE are not fully reimbursable and should be anticipated.

The mortgage banking company must maintain adequate management reports to measure and track the quality of originated, purchased, and serviced assets. Proper administration over loans and other assets held for sale or investment requires the use of aging and other tracking reports. For assets held for sale, the reports should identify loans and other marketable assets, other than marketable securities,[7] that have been in this category longer than 60 days. In such instances, a determination should be made as to whether credit quality problems and/or documentation deficiencies exist that will prevent the timely sale of the loan in the secondary market. If problems are not correctable within a reasonable timeframe, the loans and other related assets should be revalued and transferred to the held-for-investment category. Procedures governing the valuation and transfer of poor-quality assets should be in writing and should be followed.

The MIS should also generate for management's review reports on the delinquency status of loans held for investment and loans serviced for investors. Such reports provide an early warning system and an analysis tool to evaluate internal collection activities. If a loan becomes delinquent (30 days or two payments past due), the borrower should be contacted. Collection efforts should be strengthened if the delinquency continues. If the loan becomes severely delinquent, foreclosure proceedings should be initiated consistent with the investor-servicing agreement, and the value of the collateral supporting the loans should be assessed. Anticipated shortfalls should be recognized as losses in a timely manner.

MIS should also include an internal loan-grading system, which tracks the borrower's ability to meet its monthly payment obligations. Although MIS should be tailored to meet management's needs, information should be consistent with loan-grading systems that are used by the controlling bank holding company and federal bank regulatory agencies. Reports should also track collection and foreclosure actions initiated by the servicer and repurchase requests initiated by a permanent investor or other third party.

Examiners should also verify that appraisal practices are consistent with the Board's

6. For certain credits, the bank holding company should develop criteria for obtaining reappraisals or revaluations as part of a prudent portfolio review and monitoring program.

7. For mortgage-backed securities available-for-sale, similar account classification procedures apply, but those are accounted for in accordance with SFAS 115.

appraisal regulations,[8] the interagency appraisal and evaluation guidelines (see SR-94-50, SR-94-55, SR-95-16, SR-95-27, and SR-95-31), and any other state and federal laws and regulations. Mortgage banking companies that are subsidiaries of either state member banks or bank holding companies are subject to the same appraisal standards and requirements as their parent companies.

3070.0.5.4.1 Classification Procedures

The classification process begins with an analysis of delinquent loans. The examiner should begin by obtaining an aged listing of all delinquent loans in the held-for-sale and the held-to-maturity portfolios. Clear-cut shortfalls in property values compared with loan or investment values should usually be classified unless there are mitigating circumstances. Usually loans or investments with doubtful or loss elements have other significant weaknesses that will ordinarily justify a classification of substandard for the remaining balance. Loans secured by collateral such as real estate should be classified in accordance with these guidelines and the applicable classification guidance found in sections 2060.1 and 2090.1 of the *Commercial Bank Examination Manual* and sections 2010.2, 2065.1, 2240.0, and 5010.10 of this manual.

Portions of these loans may warrant a more severe classification if the value of the underlying collateral is insufficient to fully repay the loan. The identification of potential or actual loss exposure may warrant the use of either a split (substandard and loss) or a doubtful rating.

The examiner should also review the ORE portfolio, notes and accounts receivable, and other investments on the company's balance sheet for potential classifications. ORE may usually warrant a substandard classification due to an investment's nonearning status and an increased probability of loss on disposal of the underlying assets.

Assets that represent illegal or impermissible holdings or those that are subject to some regulatory concern should not be classified, per se, for these factors. Such holdings should be treated separately within the report. In those instances where a credit-quality issue is also present, the classification and the separate treatment should be cross-referenced.

8. See Regulation Y, subpart G (12 C.F.R. 225.61–67), and its incorporation by reference into Regulation H (12 C.F.R. 208.18).

The examiner should also review any off-balance-sheet exposure for which credit risk is retained. Loans sold to investors on a recourse basis have the potential of being put back to the servicer. The portion of the recourse portfolio that is severely delinquent should be classified according to the guidelines provided previously, since the exercise of this "put option" is highly likely.

At the end of the classification process, the examiner should evaluate the level and trend of classified assets to determine whether asset quality poses undue financial risk to the mortgage banking company or its parent bank holding company. A list of total classifications should be compiled and left with management.

As part of the analysis of asset quality, the aggregate of loss classifications plus an amount expected to ultimately be loss should be compared with the existing allowance for loan and lease losses. If the aggregate exceeds the existing contra asset balance(s) then additional loan-loss provisions are needed. In such situations, the parent company should be advised of the deficiency and reminded of its responsibility to ensure that an adequate allowance for loan and lease losses, as well as other contra asset valuation balances, is maintained by the subsidiary for its asset portfolio.

Any discrepancies between the classifications list and information contained on the company's MIS should also be discussed with management. If asset quality presents undue or excessive risk, appropriate comments should be documented and brought forward on Examiner's Comments and Matters Requiring Special Board Attention, page one of the report.

3070.0.5.4.2 Presentation of Classifications

As a minimum standard, brief write-ups stating the reason for classifications should be provided for any nonbank subsidiary's asset whose doubtful and/or loss classification exceeds the lesser of $100,000 or 5 percent of the subsidiary's total assets. In general, substandard assets should be listed without a write-up, regardless of size. However, a brief write-up is required for any asset whose classification is challenged by management. The examiner has the option to provide a write-up for any classified assets, regardless of size.

While the following presentation guidelines may be useful in structuring the write-ups, the examiner may include any other format appropriate to the situation:

- recapitulation of the status and purpose of the loan, the lien position, type and appraised value of the collateral, its delinquency and accrual status, guarantors and other debit or credit balances related to the loan
- the problems with the loan, borrower, or collateral, presented in a concise, descriptive narrative
- the examiner's evaluation of the situation, indicating estimated values, major assumptions, and mitigating or negative factors
- the classification, which should represent a logical combination of the relevant factors presented in the first three elements

Within the elements presented, the examiner should stress accuracy, brevity, and clarity in the presentation, as well as a logical pattern leading to the classification. Historical information and financial data that are not pertinent or that are too stale to have a direct bearing on the present situation should not be included.

Presentations for OREO properties need not include the original loan date, history, and financial information, unless there is some relevance to the current condition (for example, the property has been foreclosed on for the second time or some circumstance before foreclosure continues to have an impact). For those companies in which numerous loans and OREO properties are classified, a summary of classifications, segmented by loans and real estate owned and indexed to the pages containing the classifications, presents clear benefits to the users of the report. This becomes more pertinent when numerous assets below the write-up line are included in total classifications. In addition, both management and the subsequent examiners will have an official listing of the classifications.

3070.0.5.4.3 Reserves

Management should establish and maintain adequate contra asset allowances and other contingency reserves to cover identified loss exposure. Policies and procedures, and financial statement disclosures, should clearly state the purpose of and intended accounting treatment for each reserve. Management should evaluate the level of each reserve account at least quarterly, document this analysis, and replenish each reserve as necessary.

The financial presentation for reserves varies. Reserves maintained for on-balance-sheet exposure are generally reported as a contra asset. Reserves maintained for contingent liabilities relating to the sale of loans and servicing of loans for investors may be shown as a liability in practice.

Disclosures relating to valuation reserves should be consistent with GAAP. Examiners may wish to confer with the mortgage banking company's external auditors regarding the nature or appropriateness of any reserve accounts that are unusual.

3070.0.5.5 Earnings Performance

Earnings performance should be assessed in terms of the level, composition, quality, and trend of net income. The earnings analysis should consider internal factors such as the company's business orientation and management's growth plans, as well as relevant external factors such as interest rates and economic trends.

Unusual aspects of origination and servicing-fee income, marketing gains and losses, the net interest margin, provisions for losses, salaries and overhead items, or income taxes should be discussed with management, as well as with internal or external auditors. Large write-downs or amortization adjustments relating to mortgage-servicing rights should also be investigated. (See section 3070.0.6.)

Current and historical ratio trend analysis, compared with published industry results (for example, see the Mortgage Bankers Association's annual statistics in the ''Mortgage Banking Performance Report''), should also be incorporated into the profitability analysis, where appropriate. This includes income structure, expense structure, and operating performance ratios. However, ratios that compare earnings to average assets or equity may be of limited use unless the examiner also considers the transitory nature of the balance sheet and the impact of off-balance-sheet servicing activities on the company's use of financial leverage. Finally, the examiner should consider the company's ability to generate sustainable positive earnings consistently over time, as well as the proportionate share of consolidated earnings (or losses).

3070.0.5.6 Liquidity and Funding

Management's ability to satisfy the company's liquidity needs and plan for contingencies without placing undue strain on affiliate bank or nonbank resources or reliance on the parent bank holding company is crucial. Liquidity needs depend on the size of the warehouse, the nature and extent of longer-term assets, opportunities to issue debt at a reasonable price, and management's ability to forecast and plan for contingencies. Liquidity is often dependent on cash generated through short-term liquid assets and on short-term borrowings to fund operations. Earnings performance, capital adequacy, the degree of market contact with underwriters and credit rating agencies, maintenance of debt covenants, and contingent liquidity plans are all significant factors in the evaluation of liquidity. Liquidity can quickly erode if investor perceptions of a company's credit standing change. Consequently, the ability to fund mortgage operations under economic duress and access to alternate liquidity sources become key considerations.

Funding needs are driven by the need to temporarily finance mortgage loans and MBSs before their sale to a permanent investor. The examiners should do a trend review of external liquidity to assess how easy it is to sell mortgage-backed securities by the firm in the secondary market. The analysis should include the normal trading volume in MBS securities, the volume of loans held for sale and their market value, and the size of the ‘‘floating’’ supply of mortgage securities or loans that are not closely held. Liquidity needs must also take into consideration longer-term assets such as fixed assets, mortgage-servicing rights, and permanent loan and MBS portfolios. (See section 2080.05.)

3070.0.5.6.1 Financial Flexibility

The liquidity analysis should include a determination as to the company's financial flexibility. Financial flexibility is the ability to obtain the cash required to make payments as needed. Cash can be obtained from (1) business operations; (2) liquid assets already held by the company either in the form of cash or marketable securities or by selling liquid assets such as receivables or inventories for cash; and (3) external lines of credit, bank borrowings, or the issuance of debt or equity securities in the capital markets.

3070.0.5.6.2 Cash-Flow Analysis

The liquidity analysis should also include a review of the net current items on the cash-flow statement pertaining to cash flow from operations, cash flows from investing activities, and cash flows from financing activities on a year-by-year trend basis. The examiner's analysis of cash flows may reveal transactional trends between cash inflows and outflows. For example, within the Cash Flows from Operating Activities, cash flow from the sale and principal repayments on mortgage loans held for sale may correlate with originations and purchases of mortgage loans available for sale. With regard to investing activities, attention should be given to the differences between short-term purchases of mortgage loans held for investment versus principal repayments on mortgage loans held for short-term investment. In addition, purchases of real estate owned from the loan-servicing portfolio may correlate with net sales of real estate owned. A review of the financing activities should indicate if there is sufficient cash flow provided from revolving warehouse lines of credit, commercial paper, proceeds from the issuance of any other short-term debt, and net changes in advances payable to affiliates.

The summary analysis of the cash-flow statement should convey how the underlying transactions collectively contribute to a positive cash flow and liquidity. When analyzing liquidity, the examiner needs to consider the principles and guidelines set forth in section 2080.05, ‘‘Funding (Bank Holding Company Funding and Liquidity)’’ of this manual.

3070.0.5.6.3 Asset/Liability Management

In general, funding liability maturities should closely approximate the maturities of underlying assets to mitigate the risk of a funding mismatch. Otherwise, the company is exposed to short-term interest-rate fluctuations unless appropriately hedged. Funding mismatches can lead to significant earnings volatility in the event that interest rates change rapidly. Management's asset/liability management program should be evaluated in terms of the degree of matching, risk aversion, and the accuracy of information that is provided to the holding company through daily, weekly, or monthly management reports.

3070.0.5.7 Capital Adequacy

Capital must be adequate to absorb potential operating losses, provide for liquidity needs and expected growth, and meet minimum requirements set by third-party creditors and investors.

At a minimum, a mortgage banking company must meet the nominal capital levels required by investors such as FannieMae ($250,000) or FHLMC ($1 million, based on financial reporting under GAAP, or $500,000, adjusted for certain assets and any deferred-tax liability). Additional capital is required based on the outstanding principal balance of loans serviced for investors. If these requirements are not met, the company may not be able to sell mortgages to and/or service mortgages for these investors.

As noted above, these are minimum capital requirements. Management should identify the level of capital that is required to support current operations and projected future growth, given the risk tolerance preferences of management and the board. Capital levels, dividend payments, and capital planning should be addressed in a written capital plan that is reviewed and approved by the board at least annually in conjunction with the budgeting and strategic planning activities.

There also may be a need to meet minimum leverage ratios established by the parent bank holding company or to meet debt covenants set forth in either warehouse credit facilities or long-term debt instruments. Companies that have excessive off-balance-sheet risk or high growth expectations may require additional capital. In addition, risk-based capital guidelines impose certain reporting requirements and limitations regarding the amount of MSA mortgage banking companies may include in their regulatory capital.

Capital levels should be monitored and reported to the company's board of directors regularly to mitigate the risk of inadequate or eroding capital. Management and the board are further encouraged to adopt a capital policy that specifically addresses the particular needs of the company.

The examiner should evaluate capital adequacy, the amount of dividends that are upstreamed to the parent bank holding company, and the extent to which the parent company can be relied on to augment the ongoing capital needs of its bank and nonbank subsidiaries. In some instances, the parent company may operate on the premise that the mortgage banking company requires little capital of its own as long as the parent company remains adequately capitalized.[9] Under the Federal Reserve's source-of-strength doctrine, the parent company must be prepared to support its subsidiaries should the financial need arise. If the parent is not prepared to inject capital and capital levels have declined, the examiner should comment on the mortgage banking company's extended leveraged position on page one of the inspection report. Under extreme circumstances, the examiner should also recommend that its leverage be reduced and its capital structure augmented to ensure that mortgage operations are conducted in a safe, sound, and prudent manner.

3070.0.5.8 Overall Assessment

The overall financial condition of the mortgage banking company should reflect its financial statement presentation, asset quality, earnings, liquidity and funding practices, and capital adequacy. Report comments should be prepared to the extent necessary.

3070.0.5.9 Inspection Objectives

1. To evaluate the financial condition of the mortgage banking company based on a review of the following:

- primary balance-sheet and income-statement levels and trends
- off-balance-sheet exposure such as the servicing portfolio
- asset quality
- earnings performance
- funding sources and liquidity needs
- capital adequacy

2. To determine the accuracy of regulatory reporting (regulatory accounting practices (RAP) and GAAP) and compliance with applicable state and federal laws and regulations.

3. To evaluate the quality of the mortgage banking company's assets for collateral sufficiency, performance, credit quality, and collectibility.

4. To assess earnings performance through the analysis of the level, composition, and trend of net income. If material, interest income, impairment of mortgage-servicing assets, gains and losses on asset sales, and personnel and other expenses should be factored into the analysis.

9. When MSAs are valued for inclusion in capital, the risk-based capital guidelines for banks and BHCs require the discount rate to be not less than the original discount rate inherent in the intangible asset at the time of its acquisition, based on the estimated future net cash flows and price paid at the time of purchase.

5. To assess the funding and liquidity needs of the mortgage banking company through ratio analysis and a review of the funding instruments used.

6. To assess capital adequacy by ensuring that investor minimum requirements are met and by comparing capital levels with peer and industry data. Consideration of the capital needs of the individual mortgage banking company should override any comparison with peers.

3070.0.5.10 Inspection Procedures

Financial Statement Level and Trends

1. Review the mortgage banking company's financial statements and related notes over the previous three-year period.

2. Discuss significant balance-sheet and income-statement categories with management, as well as with internal and external auditors.

3. Determine whether financial trends are consistent with the economic environment, interest-rate movements, the company's business orientation, and management's intended growth strategy.

4. Determine whether reports filed with regulatory agencies are prepared accurately and submitted in a timely manner, with particular attention paid to the reporting for mortgage-servicing assets and recourse obligations retained by the mortgage banking company.

Asset Quality

1. Spread past-due and nonaccrual loans by balance-sheet asset category (for example, mortgage loans held for sale, mortgage loans held for investment), product type, and delinquency status (for example, 31–90 days, 91–180 days, and 181 days and over). Include any loans in the process of foreclosure.

2. Obtain a trial balance and delinquency listing for loans held for sale and loans held for investment.

a. Reconcile balances of the real estate held for sale and investment to the respective general ledger accounts.

b. Classify severely delinquent loans as required based on the financial condition of the borrower, his or her inability to make monthly payments as required, and the protection afforded by current collateral values.

c. Determine accounting policies and practices with respect to these loans. Review aging reports for loans held for sale and for investment. Discuss the frequency of reviews for loans held for sale, revaluation practices, and transfers among accounts. Verify that accounting practices are consistent with GAAP and RAP.

3. Obtain a listing of loans in the process of foreclosure and bankruptcy and discuss these with management for potential classification.

4. Reconcile all other real estate owned by the mortgage banking company to the general ledger and classify based on risks and any income-producing characteristics of the properties. Compare current appraisals to carrying value for potential write-downs.

5. Obtain a list of loans sold under recourse arrangements and assess for potential classification.

6. Discuss the methodology used to establish foreclosure reserves and related accounting procedures. Review analysis used to project future foreclosures.

- Evaluate the adequacy of foreclosure reserves based on the volume of projected foreclosure actions, average foreclosure costs, and the past history of reinstated loans.

7. Review other reserve accounts and assess for reasonableness.

Earnings Performance

1. Assess earnings performance in terms of the level, composition, and trend of net income. Consider internal factors, such as the company's business orientation and management's growth plans, and external factors, such as interest rates and the economic environment, when evaluating earnings trends.

2. Discuss any unusual aspects of origination and servicing-fee income, marketing gains and losses, the net interest margin, reserves, write-downs or adjustments in MSA amortization, salaries and overhead items, or income taxes with management, as well as with internal or external auditors.

3. Incorporate ratio and industry comparisons into the earnings analysis, where appropriate. Bear in mind that ratios that compare earnings to total assets or equity are of limited use unless the transitory nature of the balance sheet and the impact of off-balance-sheet servicing

activities on the company's use of financial leverage are taken into consideration.

Liquidity and Funding

1. Determine the mortgage banking company's liquidity needs based on a review of the size of its warehouse and the nature and extent of other longer-term assets.

2. Determine whether sources of liquidity are adequate, both under current conditions and economic duress. Consider earnings performance, capital adequacy, the degree of market contact with underwriters and credit rating agencies, maintenance of debt covenants, and contingent liquidity-planning capabilities.

3. Evaluate financial instruments used to fund mortgage operations. Financial instruments may include repurchase agreements, commercial paper, revolving warehouse lines of credit, and/or long-term debt. Review related credit agreements and systems used to monitor compliance with debt covenants.

4. Establish whether excessive borrowing activities have led to a highly leveraged financial condition that exposes the company to money market changes in the cost of funds. Evaluate the impact a change in the company's cost of funds would have on its net interest margin and earnings.

5. Determine the degree of financial flexibility the company maintains. Financial flexibility is the ability to obtain the cash required to make payments as needed. Does the company possess adequate financial strength and have access to lines of credit and/or assets that can be easily collateralized?

6. Review the net current items on the cash-flow statement pertaining to cash flow from operations, cash flows from investing activities, and cash flows from financing activities on a year-by-year trend basis. Determine whether sufficient positive cash flow exists from the level of current transactions. The summary analysis of the cash-flow statement should convey how the underlying transactions collectively contribute to a positive cash flow and liquidity.

7. Review asset/liability management practices to determine whether funding maturities closely approximate the maturities of underlying assets or whether a funding mismatch exists. Is the company exposed to short-term interest-rate fluctuations that may lead to significant earnings volatility in the event that interest rates change rapidly?

Capital Adequacy

1. Determine whether capital levels are adequate to absorb potential operating losses, provide for liquidity needs and expected growth, and meet minimum requirements set by investors whose loans are serviced and other external parties.

2. Review policies and procedures to determine whether management adequately monitors and reports capital levels to the board of directors. Review the capital plan to determine whether it adequately addresses the particular needs of the company.

3. Evaluate the amount of dividends that are upstreamed to the parent bank holding company, as well as the extent to which the parent company can be relied on to augment the ongoing capital needs of its bank and nonbank subsidiaries. Is the parent company prepared to support its subsidiaries should the financial need arise? Are cash dividends paid by the mortgage banking subsidiary to the parent company reasonable?

Accounting

1. Review accounting procedures for retail loans. Determine whether loan fees in excess of cost are deferred in accordance with SFAS 91. Verify that income is recognized over the estimated life of the asset and not in the current period and that fees and costs are allowable under SFAS 91. Are controls in place to ensure proper recognition for net fee income when loans are sold? (SFAS 91 applies to loans held in portfolio, as well as to loans swapped for securities when the securities are retained.)

2. Determine if the accounting for recognizing sales of loans and mortgage-backed securities (including participation agreements) is in accordance with the three conditions for true sales recognition specified in SFAS 77, ''Reporting for Transfers of Receivables with Recourse.''[10] Also determine if the sales price

10. A transfer is recognized as a sale if—

a. The transferor surrenders control of the future economic benefits of the receivables;

b. The transferor's obligation, under the recourse provisions of the sale agreement, can be reasonably estimated. The transferor should have had past experience with the recourse provisions so that a reasonable estimate can be made. The current transferred receivables should possess characteristics was adjusted for all probable adjustments (as defined in SFAS 5, ''Accounting for Contingencies''). If the mortgage banking company is a subsidiary of a bank, refer to the bank call report, glossary entry on ''sales of assets.''

3. If servicing is retained, determine if a ''normal servicing fee'' is set and how it conforms to FannieMae/FHLMC fees and to FASB Technical Bulletin 87-3, ''Accounting for Mortgage-Servicing Fees and Rights.''[11] If the mortgage banking subsidiary is a subsidiary of a bank, see the reporting instructions for Schedule F of the bank call report (Schedule RC-F for Other Assets, Item 3—Excess residential mortgage-servicing fees receivable).

Overall Financial Condition

1. Evaluate the overall financial condition of the mortgage banking company, considering its asset quality, earnings, liquidity, and capital adequacy. Update the financial component of the supervisory rating and prepare report comments as necessary.

3070.0.6 MORTGAGE-SERVICING ASSETS AND LIABILITIES

This subsection discusses mortgage-servicing assets (MSAs) and liabilities and provides guidance with respect to the measurement, impairment testing, and financial reporting requirements of MSAs. The subsection concludes with a discussion of MSA hedging practices and instruments.

SFAS No. 125 ''Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities,'' was issued in June 1996 as an amendment to SFAS Nos. 65, 76, 77, and 115. The provisions of SFAS 125 supersede SFAS 122 and are to be applied prospectively in fiscal years beginning after December 31, 1996. The statement requires that a liability be derecognized when either (1) the debtor pays the creditor and is relieved of its obligation for the liability or (2) the debtor is legally released from being the primary obligor under the liability either judicially or by the creditor.

Under SFAS 125, a mortgage banking company is required to recognize as separate assets or liabilities the right to service mortgage loans for others, however those servicing rights are acquired. Servicing of mortgage loans includes, but is not limited to, collecting principal, interest, and escrow payments from borrowers; paying taxes and insurance from escrowed funds; monitoring delinquencies; executing foreclosure if necessary; temporarily investing funds pending distribution; remitting fees to guarantors, trustees, and others providing services; and accounting for and remitting principal and interest payments to the holders of beneficial interest in the mortgage loans. Servicing is inherent in all mortgage loans; however, it becomes a distinct asset or liability only when contractually separated from the underlying assets by sale or securitization of the assets with servicing retained or separate purchase or assumption of the servicing.

3070.0.6.1 Measurement

A mortgage banking company initially acquires MSAs either by (1) purchasing the right to service mortgage loans separately or (2) purchasing or originating mortgage loans and selling those loans with servicing rights retained. When a mortgage banking company purchases or originates mortgage loans, the cost of acquiring those loans includes the cost of the related MSAs.

With respect to SFAS 125, when an entity incurs an obligation to service financial assets, it must record servicing assets or a servicing liability for each servicing contract, unless it securitizes the assets and retains all of the resulting securities, classifying them as debt securities that are to be held to maturity. When servicing assets or liabilities are assumed, rather than being acquired by a sale or undertaken in a securitization of the financial assets that are to

similar to previously transferred receivables evidencing the transferor's relevant prior experience.

c. The transferor cannot require the transferee to repurchase the receivables, except as stated in the agreement's recourse provisions.

11. According to FASB Technical Bulletin No. 87-3, the servicing-fee rates set by GNMA, FHLMC, and FannieMae in servicing agreements should be considered a normal servicing-fee rate for transactions with those agencies. If the normal service fees are expected to be less than the estimated servicing costs, the expected loss should be recognized at the time the loans are sold. If a seller/servicer sells mortgage loans directly to private-sector investors and retains servicing on the loans, the seller/servicer should consider the normal servicing-fee rate that would have been specified in comparable servicing agreements if the loans had been sold to or securitized by one of the federally sponsored secondary market makers. As of May 1995, normal servicing-fee rates established by GNMA, FHLMC, and FannieMae were 44, 25, and 37.5 basis points, respectively.

be serviced, they are measured initially at fair value (that is, the price paid). A servicing asset or liability is amortized in proportion to and over the period of estimated net servicing income (loss). Any impairment of a servicing asset or liability is determined based on fair value.

When the mortgage banking company sells or securitizes the loans and retains the MSAs, management shall allocate the total cost of the mortgage loans (the recorded investment in the mortgage loans including net deferred loan fees or costs and any purchase premium or discount) to the MSAs and the loans (without the MSAs) based on their relative fair values if it is practicable to estimate those fair values. If a mortgage banking organization undertakes a servicing liability in a sale or securitization, the servicing liability should initially be measured at fair value.

The fair value of an asset is the amount at which the asset could be bought or sold in a current transaction between willing parties, that is, other than in a forced or liquidation sale. Quoted market prices in active markets are the best evidence of fair value and shall be used as the basis for measurement, if available. If quoted market prices are not available, the estimate of fair value shall be based on the best information that is available, including prices for similar assets and the results of valuation techniques used by management. Valuation techniques may include the present value of estimated expected future cash flows using a discount rate commensurate with the risks involved; option-pricing models; matrix pricing; option-adjusted spread models; and fundamental analysis. Valuation techniques for measuring MSAs should be consistent with the objective of measuring fair value and should incorporate assumptions that market participants would use in their estimates of future servicing income and expense, including assumptions about prepayment, default, and interest rates. If it is not practicable to estimate the fair values of the MSAs and the mortgage loans (without the MSAs), the entire cost of acquiring the mortgage loans shall be allocated to the mortgage loans (without the MSAs) and no cost shall be allocated to the MSAs.

The amount capitalized as MSAs shall be amortized in proportion to and over the period of estimated net servicing income. Estimates of future servicing revenue shall include expected late charges and other ancillary revenue. Estimates of expected future servicing costs shall include direct costs associated with performing the servicing function and appropriate allocations of other costs. Estimated future servicing costs may be determined on an incremental-cost basis.

MSAs are highly subject to interest-rate and prepayment-rate risk since the amount of future cash flows that are provided to the holder is derived from, and is thus dependent on, the outstanding balances of the underlying mortgage loans.[12] Prepayments of underlying mortgage loans accelerate during periods of declining interest rates as borrowers take advantage of the option they hold to refinance their loans. As interest rates decline, holders of MSAs are exposed to a risk of prepayment of the underlying loans, and thus a diminished amount of cash flow from their investment. Holders of interest-only stripped securities (I/O strips) are exposed to similar interest-rate and prepayment risks when interest rates decline. I/O strips possess very similar prepayment risk characteristics.

A particular mortgage company's exposure to prepayment risk can also be influenced by portfolio composition factors such as geographical mix, loan-to-value ratios, and the proportion of government (FHA/VA) and conventional loans in the portfolio. Government loans that may be assumable by the purchaser of a home are generally for smaller amounts and may be extended to borrowers with limited financial resources. As a result, government loans tend to prepay more slowly than conventional loans.

Unanticipated changes in interest rates, prepayment speed, or other valuation assumptions may impair the carrying value of MSAs and require accelerated amortization or a write-down. Therefore, the recoverability of the unamortized balance should be evaluated periodically, and amortization and/or the value of the asset should be adjusted accordingly. To the extent that impairment is not recognized, MSA values may be inflated. As a result, assets, earnings, and capital may be overstated.

12. Several conventions exist for quantifying prepayment speed. The most common convention is a measure developed by the Public Securities Association (PSA). The PSA measure was based on actual historical experience of FHA mortgages, but it is not predictive. The PSA measure assumes that mortgages prepay at a rate of .2 percent per year in the first month, increase by .2 percent each subsequent month up to 30 months, and remain at 6 percent per year thereafter until maturity. This 6 percent level is referred to as 100 percent PSA. Mortgages that prepay at 200 percent PSA pay off twice as fast as a mortgage that is performing at 100 percent PSA. Another convention is known as the conditional prepayment rate (CPR) measure. CPR assumes that a constant fraction of the remaining principal is prepaid each period, ''conditional'' on the previous period's remaining balance. Typically, CPR is computed over a one-month time period. The PSA model simply represents a series of stable CPR assumptions.

3070.0.6.2 Impairment Testing

SFAS 125 states that a mortgage banking company shall measure impairment of capitalized MSAs[13] based on their fair value. For the purpose of evaluating and measuring impairment of capitalized MSAs, management should stratify those assets based on one or more of the predominant risk characteristics of the underlying loans.[14] Those characteristics may include loan type, loan size, note rate, date of origination, term, and geographic location.

Impairment shall be recognized through a valuation allowance for an individual stratum. The amount of impairment that is recognized shall be the amount by which the capitalized MSAs for a given stratum exceed their fair value. The fair value of MSAs that have not been capitalized shall not be used in the evaluation of impairment.

Subsequent to the initial measurement of impairment, management shall adjust the valuation allowance to reflect changes in the measurement of impairment. Fair value in excess of the capitalized MSAs shall not be recognized. If the fair value of a mortgage-servicing liability increases above the book value, the increased obligation shall be recognized as a loss in current earnings. SFAS 125 does not address when a mortgage banking company should record a direct write-down of capitalized MSAs; therefore, examiner judgment in this area is required.

3070.0.6.3 Disclosures

SFAS 125 requires that the fair value of capitalized MSAs, and the methods and significant assumptions used to estimate that fair value, be disclosed. If no cost is allocated to certain MSAs, management shall describe those MSAs and describe the reasons why it is not practicable to estimate the fair values of the MSAs and the mortgage loans (without the MSAs). The risk characteristics of the underlying loans used to stratify capitalized MSAs for the purposes of measuring impairment shall also be disclosed. For each period for which results of operations are presented, the activity in the valuation allowances for capitalized MSAs, including the aggregate balance of the allowances at the beginning and end of each period, aggregate additions charged and reductions credited to operations, and aggregate direct write-downs charged against the allowances shall be disclosed.

3070.0.6.4 Intercompany MSAs

Intercompany MSAs may arise when a mortgage banking company originates loans, sells the loans to an affiliate bank, and the affiliate bank records related MSAs. Intercompany MSAs should be evaluated closely to determine whether a valid business purpose exists, the loans are actually sold, the entity holding the MSAs has revalued the rights correctly, and such intercompany MSAs are eliminated in consolidation. If the purpose of the transaction is merely to bolster capital levels at the bank, the practice may constitute an unsafe and unsound banking practice.

3070.0.6.5 Table Funding

One method of acquiring mortgage loans, and recording related MSAs, is through so-called ‘‘table-funding arrangements.’’ In a table-funding arrangement, the mortgage banking company provides the original funding when a mortgage broker or correspondent closes the mortgage loan with the borrower. Concurrent with the loan closing, the mortgage banking company acquires the loan and the related MSAs.

Emerging Issues Task Force Issue No. 92-10 (EITF 92-10), ‘‘Loan Acquisitions Involving Table Funding Arrangements,’’ clarified under what conditions these arrangements could be characterized as loan purchases. According to EITF 92-10, a mortgage banking company may account for a loan acquired in a table-funding arrangement as a purchase only if *all* of the following conditions are met:

- The correspondent is registered and licensed to originate and sell loans under the applicable laws of the states or other jurisdictions in which it conducts business.
- The correspondent originated, processed, and closed the loan in its own name and is the first titled owner of the loan, with the mortgage banking company becoming a holder in due course.

13. The term ‘‘capitalized mortgage-servicing rights’’ refers to the cost originally allocated to the MSAs less the amount amortized.

14. SFAS 65, as amended, applies to impairment evaluations of all capitalized MSAs. However, a mortgage banking company may continue to apply its previous accounting policies for stratifying MSAs to MSAs that were capitalized before the adoption of the amendments to SFAS 65.

- The correspondent is an independent third party and not an affiliate of the mortgage banking company as defined in SFAS 65. As a nonaffiliate, the correspondent must bear all of the costs of its place of business, including the costs of its origination operations.
- The correspondent must sell loans to more than one mortgage banking enterprise and not have an exclusive relationship with the purchaser.
- The correspondent is not directly or indirectly indemnified by the mortgage banking company for market or credit risks on loans originated by the correspondent. However, a commitment by the mortgage banking company for the purchase of loans from the correspondent is not considered to be an indemnification for purposes of this requirement.

If any one of the above criteria is not met, the mortgage banking company must account for the loan as an origination. MSAs that were recorded before the adoption of the SFAS 65 amendments should be reviewed to ensure that they were originated and funded consistent with the above requirements. MSAs that are recorded under SFAS 125 may arise in connection with either originated or purchased mortgage loan transactions.

3070.0.6.6 Regulatory Reporting

The examiner should also determine whether the method used to value MSAs is in accordance with the instructions for the Bank Report of Condition and Income (call report) and the BHC reporting instructions (FR Y-9C). If capitalized MSAs are not appropriately valued, they cannot be included in capital. Management should review the carrying amount at least quarterly, adequately document this review, and adjust the book value as necessary.

3070.0.6.7 Risk-Based Capital

Readily marketable MSAs may be included in a bank or bank holding company's tier 1 capital subject to certain limitations. Tier 1 capital for bank holding companies includes common equity, minority interest in the equity accounts of consolidated subsidiaries, qualifying noncumulative perpetual preferred stock, and limited qualifying cumulative perpetual preferred stock.[14a] Tier 1 capital excludes goodwill; amounts of mortgage-servicing assets, nonmortgage-servicing assets, and purchased credit-card relationships that, in the aggregate, exceed 100 percent of tier 1 capital; amounts of nonmortgage-servicing assets and purchased credit-card relationships that, in the aggregate, exceed 25 percent of tier 1 capital;[15] all other identifiable intangible assets; and deferred-tax assets that are dependent upon future taxable income, net of their valuation allowance, in excess of certain limitations.

The amount of MSAs which may be included in capital is also limited to the *lesser* of—

- the amount recorded on the balance sheet under GAAP, or
- 90 percent of their fair market value. If both the application of the limit on MSAs and the adjustment of the balance-sheet amount for MSAs would result in an amount being deducted from capital, the bank holding company would deduct only the greater of the two amounts from its core capital elements in determining tier 1 capital.

3070.0.6.8 Previously Recognized Excess Servicing-Fee Receivables

SFAS No. 125, ''Accounting for the Transfers and Servicing of Financial Assets and Extinguishments of Liabilities'' (paragraph 20), addresses the accounting treatment for excess servicing-fee receivables based on contracts that were in existence before January 1, 1997. Previously recognized servicing rights and excess servicing-fee receivables are to be combined, net of any previous servicing obligations under the contract, as a servicing asset or a servicing liability. Any previously recognized excess servicing-fee receivables that exceed contractually specified servicing fees are to be reclassified as interest-only strips receivables.

3070.0.6.9 MSA Hedging Practices and Instruments

During the refinancing waves of 1992 and 1993, several mortgage banking companies experi-

14a. Cumulative perpetual preferred stock is limited to 25 percent of tier 1 capital.

15. Amounts of MSAs, non-MSAs, and PCCRs in excess of these limitations, as well as all other identifiable intangible assets, including core deposit intangibles and favorable leaseholds, are to be deducted from an organization's core capital requirements in determining tier 1 capital. Identifiable intangible assets, however, exclusive of MSAs and PCCRs, acquired on or before February 19, 1992, generally will not be deducted from capital for supervisory purposes. They will, however, continue to be deducted for applications purposes.

enced large losses due to the impact of rising prepayments on the value of servicing rights. As a result, many companies have begun to hedge MSAs. An effective hedge program should reflect a solid understanding of the underlying MSA risk characteristics.

3070.0.6.9.1 Hedging Practices

Interest-rate and prepayment-rate risk are often reduced through the natural offset between the production and servicing functions; however, the degree of protection afforded by this relationship depends on the company's business orientation (originations versus purchases) and can be very difficult to measure.[16] Other financial instruments are also used to mitigate interest-rate and prepayment-rate risks. The remainder of this subsection discusses existing hedge accounting guidance and rudimentary descriptions of certain customized MSA hedge products. Examiners should also refer to the Federal Reserve System's *Trading Activities Manual* for additional guidance on derivatives.

3070.0.6.9.2 Hedge Accounting

Existing accounting literature is vague with respect to the accounting treatment for MSA hedge products, particularly in the area of derivatives. However, analogies exist that facilitate the application of existing accounting standards. SFAS No. 80, ''Accounting for Futures Transactions,'' provides financial reporting standards for exchange-traded futures contracts on both interest-rate products and raw materials (commodities). Several EITF issues releases provide financial reporting guidance for interest-rate swap transactions. Finally, an issues paper prepared by the American Institute of Certified Public Accountants (AICPA), ''Accounting for Options,'' provides informal but nonauthoritative guidance relating to options contracts. The AICPA issues paper addresses options on all tangible goods, including both exchange-traded options and nonexchange traded options on interest-rate caps and floors.

16. When interest rates fall, increases in production volumes and related revenues tend to offset runoff in the servicing portfolio and reductions in servicing-fee income. Alternatively, to the extent that the marketing department hedges less than 100 percent of its estimated long position (closed loans plus rate-locked loans that are expected to close) and interest rates fall, the resulting marketing gains on the uncovered position tend to offset a portion of any required write-downs in the servicing portfolio.

To qualify for hedge-accounting treatment under SFAS 80, a financial instrument must meet two criteria:

- The hedged item exposes the entity to price or interest-rate risk.
- The financial instrument used as a hedge reduces that exposure and is designated as a hedge.

SFAS 80 states that at the inception of the hedge and throughout the hedge period, changes in the market value of the financial instrument used as a hedge should correlate highly with changes in the fair value of, or interest income or expense associated with, the hedged item(s) so that the results of the financial instrument(s) used as a hedge will substantially offset the effects of price or interest-rate changes on the exposed item(s). Although required correlation levels are not specifically defined, the accounting industry has determined that 80 percent is a reasonable benchmark.

Before claiming hedge-accounting treatment, management must obtain an opinion from its CPA or internal accountant confirming that the instrument that is proposed would qualify for such treatment. If these criteria are not met, the financial instrument should be carried at its market value (i.e., marked to market). Hedge performance should be monitored daily and reported to the responsible management or board committee at least quarterly.

3070.0.6.9.3 Relevant MSA Characteristics

To evaluate a mortgage banking company's hedge program for MSAs, one must first understand how MSAs perform. Duration, convexity, and amortization are useful concepts that will be reviewed as they relate to MSAs. Duration measures the change in the value of MSAs (or their cash flows) for a given change in interest rates. Duration can be either positive or negative. An asset with a positive duration, such as a fixed-income bond, tends to increase in value as interest rates fall. Conversely, an asset with a negative duration, such as an MSA, tends to decrease in value as interest rates fall.

Convexity measures the rate of change in an instrument's duration, or the nonlinearity of its price/yield curve. Like duration, convexity can be either positive or negative. An asset with a positive convexity will rise more in value for a given change in interest rates than it will fall if interest rates move equally in the opposite direction. Conversely, an asset with a negative convexity will decline more in value for a given change in interest rates than it will increase in value if interest rates move equally in the opposite direction. Because of their prepayment characteristics, MSAs and most other mortgage-related assets are negatively convex within a specified range of interest rates. Borrowers can be expected to exercise their option to prepay a loan at a time that is most disadvantageous to the MSA holder.

MSAs are also an amortizing asset. When a prepayment occurs, the loss of value is permanent and cannot be recovered. The use of a nonamortizing asset as a hedge would necessitate an active hedge-management strategy to adjust the position as the unamortized balance of the MSAs declines. If the position is not adjusted correctly, this strategy may expose earnings and capital to additional risks that are not within the scope of the company's MSA hedge program.

3070.0.6.9.4 Hedge Instruments

An effective MSA hedge instrument will possess characteristics that mitigate the interest-rate and prepayment risks associated with MSAs without assuming additional basis risk. Basis risk measures how well changes in the value of the hedge instrument correlate to changes in the value of the MSA. An effective hedge should also be reasonable in terms of transaction costs and management's time.

Several types of specialized derivative products have evolved to meet the needs of mortgage banking companies. Early MSA hedge products were interest-rate-driven, utilizing zero-coupon Treasury bonds or interest-rate swaps. However, the basis risk of such hedges proved to be excessive. Next came principal-only (PO) and super-principal only (SPO) bonds, which were prepayment-driven.[17] However, these products also proved ineffective due to geographic basis risk, potential average-life mismatches, additional capital requirements, and dissimilar accounting treatment which led to accounting losses.

MSA hedge products generally fall into three categories: bond hedges, short-term option hedges, and long-term option hedges. Bond hedges use Treasury bonds, ''plain vanilla'' interest-rate swaps, interest amortizing rate swaps, positive convexity swaps, POs, and SPOs. Bond hedges may be either interest-rate-driven or prepayment-rate-driven. Prepayment-rate-driven products reduce more basis risk and are therefore more expensive. Although most bond hedges are positively convex, they fail to provide enough positive convexity to offset the negative convexity in MSAs. In other words, when interest rates decline, the value of the bond hedge will not increase in an amount sufficient to offset the simultaneous decline in the MSAs. Another disadvantage to bond hedges is that the downside risk is generally unlimited.

Short-term option hedges consist of over-the-counter (OTC) Treasury options, options on futures contracts, and options on OTC mortgage securities. Short-term option hedges generally contain enough positive convexity to offset the negative convexity of MSAs, and the downside risk is limited to the option premium paid at inception. However, option strategies using these products require frequent rebalancing, are therefore expensive, and do not work well in a rapidly changing interest-rate environment because they are not amortizing assets.

Long-term option hedges include prepayment caps, interest amortizing rate (IAR) servicing hedges, LIBOR floors, and swaptions. These products may protect the servicer and/or seller against changes in either interest rates or prepayments. As off-balance-sheet products, they impose very few capital constraints on the MSA holder.

A prepayment cap is an off-balance-sheet, prepayment-driven option product that can be used to hedge a mortgage-servicing portfolio. In exchange for paying a fee, either up-front or over the life of the hedge, the servicer and/or seller receives a payment from the counterparty every month that the option is ''in the money.'' The option is in the money if the difference between the ''strike balance'' and the actual balance of a ''reference portfolio,'' less the sum of previous balance differences, is positive. Each month the option is in the money, the counterparty will pay the ''strike price,'' usually the book cost of the servicing portfolio, multiplied by this balance shortfall. The reference portfolio, strike price, and strike balance can be customized to match the servicer and/or seller's risk parameters and individual portfolio.

17. A special class of REMIC securities backed by POs. SPOs are a more leveraged type of PO.

An IAR servicing hedge is an off-balance-sheet, interest rate–driven option product that can be used as either a revenue or a balance-sheet hedge of a mortgage-servicing portfolio. In exchange for paying a fee, either up-front or over the life of the hedge, the servicer and/or seller receives a series of payments from the counterparty to the extent that amortization of a "reference balance" exceeds scheduled amortization of a "strike balance." The main difference between an IAR and a prepayment cap is that with an IAR, option payments are based on the performance of a "reference portfolio" rather than the seller and/or servicer's actual portfolio. For an IAR revenue hedge, the option payout is based on the current balance shortfall between the reference and strike balances. For an IAR balance-sheet hedge, option payouts are based on the cumulative excess amortization of the reference balance over the strike balance. IAR hedges are less expensive than comparable prepayment-linked hedges because they contain basis risk. If actual prepayments occur more rapidly than predicted at the onset of the hedge, the servicer and/or seller will be underhedged.

Numerous other types of customized hedge products are available. The advantages and disadvantages of each product should be well understood before it is incorporated into a mortgage banking company's interest-rate risk management strategies.

3070.0.6.10 Inspection Objectives

1. To determine whether MSAs pose a significant financial risk to earnings and capital.

2. To evaluate management's expertise and the oversight provided by the board of directors.

3. To determine whether policies and procedures used to initially record, amortize, and reevaluate MSAs are in conformance with GAAP and risk-based capital requirements, and whether actual practice is consistent with stated policies and procedures.

4. To verify that asset values are fairly stated.

5. To evaluate the methods used to hedge interest-rate and prepayment risks associated with MSAs, the degree of oversight provided by management or the board of directors, the adequacy of written policies and procedures, and the effectiveness of the company's hedge program for MSAs.

6. To identify any excessive risk-taking which is caused by the company's business mix and/or strategy.

3070.0.6.11 Inspection Procedures

1. Determine the extent of financial risk associated with MSAs through a review of the following:

a. Significant changes in the size of the servicing portfolio. Obtain a reconciliation for the servicing portfolio for the prior fiscal year and the most recent interim period. If significant growth has occurred, determine whether loans were originated, purchased individually (on a flow basis), purchased in bulk transactions, or acquired through whole company acquisitions. If the portfolio size has declined, determine the reason for such decline (sales of servicing rights, prepayments) and the impact on the remaining servicing portfolio.

b. The proportion of capitalized MSAs relative to the outstanding principal balance of mortgage loans in the servicing portfolio.

c. Other unusual characteristics of the servicing portfolio that may present undue risk, such as the weighted average coupon rates, weighted average maturities, delinquency characteristics, or mix of government (FHA/VA) loans versus conventional loans.

If the level of financial risk is sufficient to place earnings and capital at risk, the examiner should complete the remainder of the MSA procedures.

2. Review the qualifications of the individuals who are responsible for initially recording, amortizing and evaluating MSAs. Does management possess the necessary accounting expertise and experience with respect to valuation methodologies?

3. Review the accounting systems used to track MSAs. Is the necessary information being maintained in an understandable and useable form? Does the adoption of SFAS 65, as amended, and 125 pose any system problems for the company? Are such problems being addressed in a timely manner? At a minimum, MSAs should be tracked by product type and year of origination. The following information should be maintained for each pool of loans: the original and current principal balance for each pool; original and current book values of related MSAs; prepayment speeds, normal servicing fees, and the original discount rate used; and the actual historical payment experience for each pool.

4. Review written policies and procedures for initially recording, amortizing, and periodically revaluating MSAs. Determine the manage-

ment or board committees responsible for approval of such policies, the date of last approval, and the frequency of their review.

5. Determine whether MSA policies and procedures are in conformance with GAAP and risk-based capital requirements and whether actual practice conforms with established policies and procedures. At a minimum, policies and procedures should clearly address the following areas:

a. Initial valuation of MSAs and related pricing policies. With respect to MSAs, policies and procedures should describe the method for allocating the total cost of originated and purchased mortgage loans to the MSAs and the related loans (without the MSAs) based on their relative fair values at the date of origination or purchase; procedures to be followed if a definitive plan for sale of the loans does not exist and loans are sold at a later date; procedures to be followed in the event that it is not practicable to estimate the fair value of the MSAs and the related loans (without MSAs); and MSAs recorded under table funding relationships with correspondents and/or brokers.

b. The method for amortizing MSAs over the estimated lives of the assets, and instances where amortization lives may be adjusted.

c. The method for measuring impairment of capitalized MSAs based on their fair value. Policies and procedures should address the basis for stratification of MSAs based on the risk characteristics of the underlying loans; the types of valuation allowances used to reflect changes in the measurement of impairment; the method used to arrive at the fair value of assets (quoted market prices, estimated prices for similar assets, and the results of valuation techniques); the frequency of revaluation tests; the presentation of valuation test results to senior management and the board of directors; instances where write-downs would be required; disclosures; and the basis for assumptions used.

6. Verify that the valuation techniques for measuring MSAs are consistent with the objective of measuring fair value. Review model output and related manuals and/or marketing materials. Evaluate the reasonableness of all key parameters and assumptions, with an emphasis on the source for prepayment speed estimates, the number of interest-rate ‘‘paths’’ used (vectoring or binomial models being more desirable than a single interest-rate projection path), the basis for the interest rate used to discount cash flows, and the source of servicing revenue and cost data.

7. Review the most recent quarterly valuation process and the related output to determine whether necessary write-downs or amortization adjustments were made, management or board oversight was adequate, and actual practice is consistent with established policies and procedures. Ensure that any significant changes to the model’s parameters and/or output are approved by the appropriate management or board committee and that such changes are adequately documented.

8. Verify that disclosures are accurate with respect to the following:

- the fair value of capitalized MSAs
- the methods and significant assumptions used to estimate that fair value
- a description of MSAs for which no cost has been allocated and the reasons why it is not practicable to estimate the fair values of those MSAs and the mortgage loans (without the MSAs)
- the risk characteristics of the underlying loans used to stratify capitalized MSAs for the purposes of measuring impairment
- the activity in the valuation allowances for capitalized MSAs, including the aggregate balance of the allowances at the beginning and end of each period; aggregate additions charged and reductions credited to operations; and aggregate direct write-downs charged against the allowances

9. Obtain a list of intercompany MSAs as of the close of business for the most recent quarter-end. Determine whether a valid business purpose exists, the loans are actually sold, the entity holding the MSAs has revalued the rights correctly, and such intercompany MSAs are eliminated in consolidation. If the purpose of the transaction is merely to bolster capital levels at the bank, the practice may constitute an unsafe and unsound banking practice.

10. Review policies and practices regarding the sale of MSAs and liabilities to investors.

11. If the company sells loans with recourse, are recourse reserves established at the time of sale? Are estimated losses factored into the calculation of gain/loss on sale of loans?

12. Obtain an organizational chart to determine the individuals responsible for hedging MSAs. Review biographies to ensure that staff members responsible for this function are knowledgeable regarding accounting guidance, hedge products, and related strategies.

13. Review methods used to hedge the interest-rate and prepayment-rate risk associated with MSAs. Verify the management or board committee responsible for approving hedge instruments, the list of approved products, and the frequency and date of last review.

14. Review management reports to determine the correlation between hedge instruments and the underlying assets, the accounting treatment for hedges, related gains and losses, and the overall effectiveness of the company's hedge program. If hedge accounting treatment is being used, management and/or the company's external accountants must perform the appropriate level of due diligence and maintain adequate supporting documentation. In determining the effectiveness of the hedging program, the examiner should compare the actual results of hedge performance with the expected results.

15. Evaluate the quality of information that is communicated to senior management, the board of directors (if applicable), and the parent company's senior management and board of directors to determine whether management and directors are adequately informed regarding the financial risks associated with MSAs, amortization methods and hedging techniques, and the degree of risk inherent in the company's strategic focus and business mix with respect to the projected volume of MSAs.

3070.0.7 INTERCOMPANY TRANSACTIONS

A mortgage banking company that is organized as a nonbank subsidiary of a bank holding company often sells assets to, receives funding from, or services loans for its bank affiliates. Given the trend toward managing mortgage banking activities as a line function rather than by legal entity, such intercompany transactions have become an area of heightened supervisory concern.

In general, sections 23A and 23B of the Federal Reserve Act are designed to prevent a bank from being disadvantaged through the purchase of low-quality assets from an affiliate, the pressure to fund the majority of an affiliate's working-capital needs, and intercompany transactions that either inadequately compensate the bank or are not conducted on an arms-length basis.

3070.0.7.1 Section 23A of the Federal Reserve Act

Section 23A was enacted as part of the Banking Act of 1933 (the Glass-Steagall Act) for state member banks and later extended to all federally insured banks.[18] Section 23A defines companies that control or are under common control with the bank as affiliates of the bank. For example, the term ''affiliates'' includes bank holding companies and their subsidiaries as well as banks and nonbanking companies that are under common individual control.[19] The two primary aspects of section 23A—quantitative restrictions and collateral requirements—are discussed next.

3070.0.7.1.1 Quantitative Restrictions

The quantitative restrictions imposed by section 23A generally limit the aggregate amount of so-called ''covered transactions'' to 10 percent of the bank's capital and surplus for transactions with a given affiliate, and 20 percent of the bank's capital and surplus for transactions with all of its affiliates.[20] Covered transactions include—

- a loan or extension of credit by a bank to an affiliate, such as a warehouse line of credit provided to the affiliate;
- the purchase of or investment in securities such as a privately issued MBS issued by an affiliate;
- the purchase of assets from an affiliate, such as a loan purchased either as an accommodation to a bank customer or for the bank's asset/liability management purposes;
- the acceptance by a bank of securities issued by an affiliate as collateral for a loan or extension of credit by the bank to any person or company (Securities might include either the stock of a publicly held affiliate or the stock from one of its officer's own business enterprises.); or

18. As originally enacted, the Banking Act of 1933 covered only member banks. In 1966, Congress amended section 18(j) of the Federal Deposit Insurance Act, 12 U.S.C. 1828(j), to extend the coverage of section 23A to include insured nonmember banks. As a result, section 23A now applies to all federally insured banks. (12 U.S.C. 371c)

19. Nonbank subsidiaries of banks, as opposed to nonbank subsidiaries of bank holding companies, are not affiliates for purposes of section 23A, unless the Board of Governors of the Federal Reserve System determines otherwise. Banks that are part of a chain banking organization are subject to the restrictions of section 23A.

20. For section 23A purposes, the definition for capital and surplus includes the allowance for loan and lease losses.

- the issuance by a bank of a guaranty, acceptance, or letter of credit, including an endorsement or standby letter of credit, on behalf of an affiliate (A letter of credit might be posted by the bank to cover an excessive number of GNMA pools that lack final pool certification.).

The examiner should determine the bank's method for identifying covered transactions and applying the quantitative limits for section 23A purposes. If a covered transaction is found that exceeds these quantitative limits, either on an individual or an aggregate basis, an apparent violation of section 23A has occurred. All such apparent violations of law should be discussed with management and cited in the report.

Particular attention should be paid to intercompany asset transfers and funding arrangements to determine whether they constitute covered transactions under section 23A. In Interpretation 250.250 (12 C.F.R. 250.250)[21] the Board determined that a member bank's purchase, without recourse, and at face value, of a mortgage note, or a participation therein, from a mortgage banking subsidiary of the parent bank holding company, which had no financial interest in the underlying asset on which it had granted credit through the note, did not involve a ''loan'' or ''extension of credit''[22] from the member bank to the seller of the mortgage note within the meaning of section 23A if—

- the member bank's commitment to purchase the loan or participation therein was obtained by the affiliate within the context of a proposed transaction or series of proposed transactions in anticipation of the affiliate's commitment to make such loan(s),
- the commitment to purchase the loan was based on the bank's independent credit evaluation of the creditworthiness of the mortgagor(s),[23] and
- there could be no blanket advance commitment by the member bank to purchase a stipulated amount of loans that bore no reference to specific proposed transactions. Accordingly, the nonbank affiliate must have adequate and independent working capital to fund its operations.

The Board stated that if the bank followed these procedures, then the bank would be taking advantage of an individual investment opportunity and thus should be exempt from section 23A. However, the Board was concerned that the bank should not be allowed to set up a business relationship with any affiliate which could create the opportunity for the bank, at some time in the future, to engage in unsafe transactions because the bank felt impelled by an improper incentive to alleviate the working-capital needs of the affiliate. Accordingly, the bank's transactions with the affiliate should not be of such a volume as to create pressure on the bank to relax its sound credit judgment concerning the individual loans involved and thereby result in an inappropriate risk to the soundness of the bank.

3070.0.7.1.2 Collateral Requirements

In addition to the quantitative restrictions, certain covered transactions between a bank and an affiliate must also be secured at the time of the transaction by collateral having a certain market value. Unless otherwise exempted, covered transactions that must be adequately secured include loans or extensions of credit, guaranties, acceptances, and letters of credit issued on behalf of the affiliate.

Collateralization requirements range from 100 percent to 130 percent depending on the type of collateral used. Acceptable forms of collateral include U.S. government or U.S. government–guaranteed obligations, instruments that are acceptable at the Federal Reserve's discount window, bank deposits that are segregated into accounts specifically earmarked for this purpose, other debt instruments, stock, leases, or other real or personal property. According to an August 31, 1987, Board interpretation (at FRRS 3–1164.3), mortgage-servicing rights do not constitute a permissible form of collateral for purposes of section 23A because of (1) their inherent volatility, making it difficult to accurately value the rights, and (2) the need to secure permission to transfer servicing rights from the legal owner of the underlying mortgage.[24]

21. See also *Federal Reserve Regulatory Service*, 3–1133.
22. Under section 23A, as amended by the Garn–St Germain Act in 1982, a member bank's purchase of a loan from its nonbank affiliate that was made to an unaffiliated party is now considered a purchase of an asset from the affiliate unless it is excepted under interpretation 250.250.
23. Dual employees may not be used to satisfy the independent credit evaluation requirement.
24. Item (2) refers to the bank's ability to sell the mortgage-servicing rights if the affiliate defaults on its loan.

An example of a covered transaction that is subject to both the quantitative restrictions and the collateral requirements of section 23A would be an overdraft in the mortgage company's checking account with an affiliate bank, which is considered an extension of credit. A line of credit by a bank to a nonbank affiliate also constitutes a covered transaction. It is important to remember that the full value of the line, not just the portion drawn down, must satisfy the quantitative and the collateral requirements of section 23A at all times. The examiner should review checking accounts and funding arrangements to ensure that the appropriate level and type of collateral is maintained. Collateral values should be monitored regularly so that depreciated or matured collateral is replaced as needed.

3070.0.7.1.3 Prohibited Transactions

In addition to the quantitative and collateral requirements, section 23A also prohibits certain affiliate transactions altogether. Most importantly, a bank and its subsidiaries may not purchase a low-quality asset (generally a classified or past-due asset) from an affiliate or accept a low-quality asset as collateral for a loan. Section 23A also requires that all covered transactions be conducted on terms that are consistent with safe and sound banking practices.

3070.0.7.1.4 Exemptions from Section 23A of the FRA

As mentioned previously, several types of intercompany transactions are exempted from the requirements of section 23A. For example, transactions between banks in which 80 percent or more of each bank's stock is owned by the same bank holding company (so-called "sister banks") are exempt from most provisions of section 23A.[25] Other transactions that are exempt include the following:

- deposits received from the affiliate during the ordinary course of business (checks in the process of collection)
- immediate credit given to an affiliate for uncollected items received in the ordinary course of business
- loans, extensions of credit, guaranties, acceptances, or letters of credit issued on behalf of the affiliate that are fully secured by obligations issued or guaranteed by the U.S. government or a segregated earmarked account in the bank
- the purchase of assets having a readily and identifiable market price at the time of purchase
- transactions that are deemed to be in the public interest and consistent with the purposes of the act

Internal controls should be in place to ensure that all transactions are adequately reviewed. Documentation should be maintained for intercompany transactions that are exempted from the requirements of section 23A.

3070.0.7.2 Section 23B of the Federal Reserve Act

The Competitive Equality Banking Act of 1987 amended the Federal Reserve Act to add a new provision, known as section 23B. In general, section 23B provides that covered transactions between a bank and its affiliates must be on terms and under circumstances, including credit standards, that are substantially the same or at least as favorable to the bank as those prevailing at the time for comparable transactions with or involving nonaffiliated companies. If no comparable transactions exist, the transaction must be on terms and under circumstances, including credit standards, that in good faith would be offered to or applied to nonaffiliated companies. A bank is also generally prohibited from purchasing as a fiduciary securities or assets from an affiliate except under specified circumstances. Finally, a bank and its affiliate may not advertise or enter into an agreement that suggests the bank is in any way responsible for the obligations of the affiliate.

Section 23B applies to any covered transaction with an affiliate, as that term is defined in section 23A. However, section 23B excludes banks from the term "affiliate." Therefore, transactions between sister banks and banks that are part of a chain banking organization are exempt from section 23B.

25. Foreign banks do not qualify as sister banks for section 23A purposes. These transactions are still subject to the prohibition against the purchase of low-quality assets and to the requirement that covered transactions be on terms and conditions that are consistent with safe and sound banking practices. It should also be noted that federal savings banks do qualify for the sister-bank exemption if all banks in the corporate chain have met their fully phased-in capital guidelines, as provided for in the Home Owner's Loan Act.

3070.0.7.3 Management and Service Fees

The Federal Reserve System's 1979 policy statement on diversion of bank income practices is intended to prevent excessive or unjustifiable management or service fees, as well as any other unwarranted payments or practices that, by diverting bank resources to the parent company or a nonbank affiliate, may have an adverse financial impact on a subsidiary (paying) bank (see section 2020.6). Diversion of income practices with respect to a mortgage banking company might potentially include, but are not limited to—

- servicing fees, or other payments assessed by the mortgage banking company and paid by the bank that bear no reasonable relationship to the fair market value, cost, volume, or quality of services rendered by the nonbank subsidiary in its role as servicer and/or seller;
- balances maintained by the bank primarily in support of mortgage banking company borrowings without appropriate compensation to the bank;
- prepayment of fees to the mortgage banking company for services not yet rendered;
- nonreimbursed origination fees, marketing costs, or other expenses incurred by the bank that primarily support the mortgage banking company's activities; and
- loan repurchase agreements between the bank and the mortgage banking company while the mortgage banking company is processing loans in the mortgage pipeline.

Purchase and funding agreements should adequately itemize and document the types of services provided and the basis for fees. Billing statements and other documentation should clearly evidence that fees actually charged and paid are reasonable and consistent with regulatory policy requirements as described.

3070.0.7.4 Tie-In Considerations of the BHC Act

Section 106 of the BHC Act Amendments of 1970 contains five restrictions intended to prohibit anticompetitive behavior by banks: two prohibit tying arrangements; two prohibit reciprocity arrangements; and one prohibits exclusive dealing arrangements.[26] The tying restrictions, which have the greatest effect on industry practices, prohibit a bank from restricting the availability or varying the consideration for one product or service (the *tying product*) on the condition that a customer purchase another product or service offered by the bank or by any of its affiliates (the *tied product*).

Section 106 was adopted in 1970 when Congress expanded the authority of the Board to approve proposals by bank holding companies to engage in nonbanking activities. The provisions of section 106 were based on congressional concern that banks' unique role in the economy, in particular their power to extend credit, would allow them to create a competitive advantage for their affiliates in the new, nonbanking markets that they were being allowed to enter.[27] Congress therefore imposed special limitations on tying by banks—restrictions beyond those imposed by the antitrust laws. Section 106 is a broader prohibition; unlike the antitrust laws, a plaintiff in action under section 106 need not show that (1) the seller has market power in the market for the tying product, (2) the tying arrangement has had an anticompetitive effect in the market for the tied product, or (3) the tying arrangement has had a substantial effect on interstate commerce.

Section 106 applies only when a *bank* offers the tying product.[28] The Board has authority to grant exceptions to section 106, which it has used to allow banking organizations to package their products when doing so would benefit the organization and its customers without anticompetitive effects.

3070.0.7.4.1 Section 225.7(d) of Regulation Y

The Board originally extended section 106, which covers tying arrangements by *banks* only, to cover nonbank affiliates and bank holding companies. The Board rescinded this extension of the statute effective April 21, 1997. Thus, unless subject to another exemption, section 106 *prohibits*—

- a bank from telling a customer that it can only receive a loan (or a discount thereon) if it purchases another product from the bank; and

26. 12 U.S.C. 1972.
27. See S. Rep. No. 1084, 91st Cong., 2d Sess. (1970).
28. See 1997 FRB 275.

- a bank from telling a customer that it can only receive a loan (or a discount thereon) if it purchases another product from an affiliate of the bank.

Section 106 and the Board's regulation allow—

- a broker-dealer affiliate to tell a customer that it can only receive placement services (or a discount thereon) if it obtains a loan from an affiliated bank; and
- a broker-dealer affiliate to tell a customer that it can only receive placement services (or a discount thereon) if it obtains a loan from a nonbank affiliate.

These distinctions make sense if one keeps in mind the concern of the statute: banks (*not* nonbanks) have special power over credit and, thus, are able to induce or coerce their customers into purchasing products that they would otherwise prefer not to purchase or to purchase from someone else.[29]

3070.0.7.4.2 Interaffiliate Tying Arrangements Treated the Same as Intrabank Arrangements

Section 106 contains an explicit exception (the *statutory traditional bank product exception*) that permits a bank to tie any product or service to a loan, discount, deposit, or trust service offered by that bank.[30] For example, a bank could condition the use of its messenger service on a customer's maintaining a deposit account at the bank. Although the statutory traditional bank product exception appears to have been effective in preserving traditional relationships between a customer and bank, the exception is limited in an important way—it does not extend to transactions involving products offered by affiliates.

The Board has adopted a *regulatory traditional bank product exception* that extends the statutory exception to transactions involving affiliates.[31] Although the Board has previously limited the scope of this extension, interaffiliate arrangements are now exempt to the same extent as intrabank arrangements.[32]

3070.0.7.4.3 Foreign Transactions Under Section 106

The Board has adopted a ''safe harbor'' from the anti-tying rules for transactions with corporate customers that are incorporated or otherwise organized and that have their principal place of business outside the United States, or with individuals who are citizens of a foreign country and are not resident in the United States. However, the safe harbor would not protect tying arrangements in which the customer is a U.S.-incorporated division of a foreign company. Furthermore, the safe harbor would not shelter a transaction from other antitrust laws if they were otherwise applicable.[33]

3070.0.7.4.4 Technical Change

The Board also has adopted a definition of ''bank'' for purposes of the anti-tying rules. The definition clarifies that any exemptions afforded to banks generally also would be applicable to credit card and other limited-purpose institutions and to U.S. branches and agencies of foreign banks.[34]

3070.0.7.5 Inspection Objective

1. To evaluate transactions between a mortgage banking company organized as a direct subsidiary of a bank holding company and affiliated banks for compliance with federal laws and regulations, and related policy guidance.

3070.0.7.6 Inspection Procedures

1. Review management's method for monitoring and identifying section 23A and 23B covered transactions and applying the quantitative limitations. Determine whether—

   a. all covered transactions have been identified;

   b. quantitative limits are calculated correctly;

   c. covered transactions, including any overdrafts and lines of credit, meet both the

29. The Board's rule also includes a limited prohibition on tying arrangements involving electronic benefit transfer services (12 C.F.R. 225.7(d)).
30. 12 U.S.C. 1972(1)(A).
31. See 12 C.F.R. 225.7(b)(1).
32. A similar action was taken for interaffiliate reciprocity arrangements, in which section 106 permits a bank to condition the availability of a product or service on the customer's providing to the bank some product or service ''related to and usually provided in connection with'' a loan, discount, deposit, or trust service (12 U.S.C. 1972(1)(C)).
33. See 12 C.F.R. 225.7(b)(3).
34. See 12 C.F.R. 225.7(e).

quantitative limits and collateral requirements of section 23A; and

d. adequate collateral values have been maintained over the life of the covered transactions (For example, collateral is maintained for the full amount of any credit lines with the bank, and any depreciated or matured collateral has been replaced as required.).

2. Review purchase and funding contracts between the mortgage banking company and the bank, as well as the substance of actual transactions, to determine that—

a. asset purchases by the bank are either within the quantitative limits of section 23A or meet the exemption requirements of C.F.R. section 250.250,

b. all purchases are at fair market value and consistent with market terms as required by section 23B,

c. no low-quality assets were transferred to the bank since the previous inspection,

d. the method of compensating the bank for balances maintained and net interest income earned on warehouse loans or lines is reasonable and based on market terms.

3. Review servicing contracts between the mortgage banking company and the bank, as well as the substance of actual transactions, to determine—

a. the capacity in which the affiliate is acting (for example, is it acting as principal on its own behalf or as an agent for the affiliate bank?);

b. the nature of all services provided; and

c. billing arrangements, the frequency of billing, the method of computation, and the basis for such fees.

4. Review the bank holding company's policy statement on the prohibition of tie-in arrangements, the adequacy of training provided to employees, and whether its respective subsidiaries are in full compliance with internal policy.

3070.0.8 REGULATION Y COMPLIANCE

During the course of the on-site inspection, the examiner is expected to conduct sufficient tests and inquiries to determine whether the company is in compliance with Regulation Y and the act. Such tests and inquiries would include a listing of company offices which can be compared with the approved offices, comparisons of credit-related insurance policies and rate schedules against stipulated public benefits cited in Board orders, and reviews of various activities for technical compliance.

While not specifically detailed in this guidance, the examiner may find it necessary to conduct a review of the company's ledgers and accounts that is sufficient to disclose possible impermissible activities and potential violations of law. The audit function, both internal and external, should not be solely relied on for this disclosure because the auditor's program may emphasize other areas of concern. As a nonbank subsidiary of a bank holding company, reference should be made to part 225 of the Code of Federal Regulations (such as section 225.28(b) of Regulation Y) and other relevant sections thereof.

Concurrent with the review of assets for credit quality, the examiner should undertake a review of asset-related activities for compliance with the subsidiary's approval orders. In mortgage banking firms, it is possible that the company is engaging unknowingly in certain impermissible activities, such as those described by 12 C.F.R. 225.126 (i.e., real estate brokerage, land development, real estate syndication, and property management) and those deemed impermissible by Board order (see sections 3000.0.4 and 3700.0 to 3700.12). The Board of Governors has ruled (1972 FRB 429) that the purchase and development of land for sale to third parties constitutes land development by a nonbank subsidiary. However, the completion of a foreclosed property to facilitate the recovery of funds advanced under the loan appears to be permissible, provided that the additional work brings the project underway at foreclosure up to a saleable condition. The Board has also ruled that property management for third parties is impermissible (1972 FRB 652). However, property management as a fiduciary, for operating premises of affiliates, or for properties acquired for debts previously contracted (DPC) is permissible. In addition to the other impermissible activities, engaging in real estate joint ventures has also been ruled impermissible. If such impermissible activities are found, they represent violations and should be appropriately treated. The servicing agreements should be reviewed to determine that no additional liabilities, real or contingent, are imposed on the company beyond its responsibilities as a servicing agent.

The usual source of growth in the servicing portfolio is the company's own origination activity. However, it is not uncommon for a company to supplement this growth with bulk purchases of serviced mortgages from other companies. Under certain circumstances, usually relating to the relative percentage of the seller's portfolio, these transactions may not comply with 12 C.F.R. 225.132. Since these transactions may represent the effective acquisition of a going concern subject to prior approval by the Federal Reserve System, "servicing portfolio" acquisitions should be reviewed for compliance.

Section 225.22(d)(1) of Regulation Y provides an exemption from required Board approval for DPC property acquired in good faith and divested within two years of acquisition. The Board may permit additional extensions that can result in the property being held by a bank holding company for a total of 10 years, if the property has value and marketability characteristics similar to real estate. In conjunction with the review of real estate owned, the examiner should determine if any subsidiary holds title to any property that should have been disposed of within the time limits of Regulation Y, the book value of which has been reduced to zero and the property is not disclosed on the balance sheet. See section 3030.0 "Acquisition of DPC Shares or Assets," for additional information on DPC property acquired.

Legal counsel representing a BHC requested an opinion as to whether certain proposed flood zone–determination activities, to be conducted through a majority-owed (50 percent) joint venture company, would be within the scope of activities related to extending credit as defined in section 225.28(b)(2) of Regulation Y. The BHC proposes to engage in a variety of lending-related activities, including providing real estate appraisals and flood zone determinations.

The Board has determined, in section 225.28(b)(2) of Regulation Y, that it is permissible for bank holding companies to engage in "[a]ny activity usual in connection with making, acquiring, brokering, or servicing loans or other extensions of credit, as determined by the Board."[35] (See 12 C.F.R. 225.28(b)(2).) The Board also determined by regulation that performing real estate appraisals is an activity that is usual in connection with making, acquiring, brokering, or servicing loans or other extensions of credit. (See 12 C.F.R. 225.28(b)(2)(i).) The Board had not specifically addressed whether providing flood zone determinations is an activity that is usual in connection with lending activities.

The proposed flood zone–determination services are considered to be a necessary aspect of mortgage lending in the United States. As noted, federal law prohibits a federally regulated lender from making, increasing, extending, or renewing a loan that is secured by improved real estate or a mobile home located in an area designated by the Federal Emergency Management Agency (FEMA) as a special flood hazard area unless the borrower obtains flood insurance.[36] (See 12 C.F.R. 208.25(c).) Further, federal law also provides that if a federally regulated lender determines, at any time during the life of a loan, that the improved real estate or mobile home securing the loan is located in a special flood hazard area and is not covered by flood insurance, the lender must instruct the borrower to obtain flood insurance and must purchase flood insurance on the borrower's behalf if the borrower fails to promptly purchase the required insurance. (See 12 C.F.R. 208.25(g).)

In addition, federal law requires the Federal National Mortgage Association, the Federal Home Loan Mortgage Corporation, and the Government National Mortgage Association (the government-sponsored enterprises or GSEs) to have procedures reasonably designed to ensure that flood insurance is in place where required at the initiation of, and during the lives of, the mortgage loans they purchase. (See 12 U.S.C. 4012a(b).) The GSEs meet this requirement by requiring lenders that sell loans to them, and companies that service loans for them, to monitor on an ongoing basis the flood zone status of any loans sold to, or serviced for, the GSEs. To comply with the requirements of federal law and the GSEs, mortgage lenders must obtain an initial flood zone determination before the origi-

35. The Gramm-Leach-Bliley Act (the GLB Act) amended the Bank Holding Company Act to limit bank holding companies that are not financial holding companies to engaging only in "activities which had been determined by the Board by regulation or order under this paragraph as of the day before the date of the enactment of the Gramm-Leach-Bliley Act on November 12, 1999, to be so closely related to banking as to be a proper incident thereto (subject to such terms and conditions contained in such regulation or order, unless modified by the Board)" (12 U.S.C. 1843(c)(8)). Before November 12, 1999, the Board had determined that "[a]ny activity usual in connection with making, acquiring, brokering, or servicing loans or other extensions of credit, as determined by the Board" was closely related to banking. Accordingly, the Board retains authority after the GLB Act to define the scope of this section 4(c)(8) activity and to modify the terms and conditions that apply to the activity.

36. Statutory authority to issue flood insurance policies under the National Flood Insurance Program (NFIP) expired on December 31, 2002, after Congress adjourned without extending the FEMA authority. On January 13, 2003, the National Flood Insurance Program Reauthorization Act was approved, extending the authorization of the NFIP to December 31, 2003; this authorization was also made retroactive to December 31, 2002.

nation of each mortgage loan and must take steps to monitor, throughout the life of the loan, the flood zone status of any improved real estate or mobile home collateral securing the loan.[37]

The joint venture company proposes to provide initial flood zone determinations to mortgage lenders and to provide mortgage lenders with ongoing flood zone–tracking services with respect to their mortgage loans. The company's activities would be limited to making determinations as to whether particular parcels of real estate are in designated flood zones, preparing the FEMA standard flood zone–determination form, and communicating flood zone determinations to customers. The company committed to not be involved in placing, underwriting, or issuing flood insurance or in the collection of flood insurance premiums. The proposed flood zone determinations would be provided in connection with providing real estate appraisals and as a separate service. In addition, the joint venture company may assist customers who wish to request that FEMA amend its flood maps to remove a property from a designated special flood hazard area.

The proposed flood zone–determination services were found to be an essential part of mortgage lending, designed to assist mortgage lenders in complying with the requirements of federal law and the GSEs. The services generally would be provided to mortgage lenders,[38] thus usual in connection with making mortgage loans. Board staff therefore issued the opinion on July 9, 2002, concluding that the proposed flood zone–determination services are within the scope of permissible activities related to extending credit under section 225.28(b)(2) of Regulation Y (12 C.F.R. 225.28(b)(2)).

3070.0.9 ON-SITE INSPECTION OF MORTGAGE BANKING SUBSIDIARIES

Scheduling of on-site inspections of mortgage banking nonbank subsidiaries of bank holding companies should be done in accordance with the Board policy for frequency and scope of inspections. (See section 5000.0.2.) After reviewing the material available at the parent company level, including the audit review, a decision whether or not to go on-site is in order. Some of the determinants of this decision would include relative size, current earnings performance, overall contribution to the corporation's condition, asset quality as indicated by nonaccrual and delinquency reports, the level of risk exposure to the organization (see section 4030.2), and the condition of the company when last inspected. From the information provided, it might be determined that the company is operating properly and is in sound condition. In such a case, an on-site inspection may not be warranted. Conversely, a deteriorating condition might be detected that would require a visit, even though a satisfactory condition had been determined during the previous inspection. Mortgage subsidiaries in unsatisfactory condition should be inspected each time the parent company is inspected. All significant mortgage banking subsidiaries should be fully inspected at least once every three years.

37. Lenders are specifically permitted to charge a reasonable fee to borrowers for flood zone determinations and life-of-the-loan tracking. For example, see 12 C.F.R. 208.25(h).

38. It was represented that the joint venture company would only market its services to mortgage lenders and that it would rarely provide services to nonlenders.

3070.0.11 APPENDIX A—FIRST DAY LETTER

FEDERAL RESERVE BANK
OF BOSTON

P. O. BOX 2076
BOSTON, MASSACHUSETTS 02106-2076

June 15, 19x9

Mr. John Doe
President
XYZ Mortgage Bank Corporation
Boston, Massachusetts 02107

Dear Mr. Doe:

In conjunction with the inspection of the XYZ Bank Holding Company, we plan to begin an inspection of XYZ Mortgage Bank Corporation on July 15, 19x9. To facilitate this inspection, please provide a copy of or make available the following information relative to your organization's mortgage banking activities. Information should be as of xx/xx/xx and should be delivered to the examiner-in-charge as soon as it is available. Whenever possible, standardized management reports should be provided. Please include the name and telephone extension of the appropriate persons to contact, by department, if additional information is necessary.

Board Oversight and Management

1. Provide a listing of the mortgage banking company's board of directors that includes each individual's name, place of employment, title and position, age, management responsibilities (if any), and the length of time he or she has served on the board.
2. List significant management and board committees and have minutes from these meetings available for examiner review. Provide a copy of standardized reports that are provided before each meeting.
3. Provide an organizational chart that highlights individuals who are responsible for the following functional areas: production, warehousing and funding, marketing, servicing, finance, mortgage-servicing asset (MSA) valuations, internal audit, quality control, loan review, compliance, and legal. Include biographies and salary information.
4. Describe any organizational changes that have taken place at the mortgage banking company since xx/xx/xx, including any mergers, acquisitions, or consolidation of mortgage banking activities. Describe any management changes at or above the senior vice president level and provide details on management's new responsibilities.
5. Provide a copy of standardized management reports that are used to monitor compliance with established policies, operating procedures, and controls within each functional area.
6. Provide a copy of the mortgage banking company's most recent operating budget and its long-term strategic plan. Evaluate how interest-rate movements, competition, and other external factors have affected product mix, staffing levels, and the allocation of capital.
7. Describe the internal control environment and the internal control programs that are in place within the mortgage banking company. Have available for examiner review the following reports that were conducted since xx/xx/xx:

   a. internal and external audits

   b. loan reviews

c. internal control and compliance audits completed by or on behalf of agencies such as HUD, FHA, GNMA, FannieMae, FHLMC, state agencies, and private investors

Also have available management's response to each report and the most recent copy of any management reports that monitor the status of outstanding issues or problems.

8. Provide an organization chart for the *internal audit* department. Indicate the scope and frequency of internal audits for the mortgage banking company, highlighting any weaknesses or problem areas noted. Upon request, make internal audit workpapers available for examiner review.
9. Provide an organization chart for the *loan review* department. Indicate the scope and frequency of loan reviews for the mortgage banking company, highlighting any weaknesses or problem areas noted. Upon request, make loan review workpapers available for examiner review.
10. Provide details on the nature and scope of the quality control program for loans originated and/or serviced for investors. Include an organization chart for the unit(s) involved in such activities, details on any outsourcing programs used since the previous inspection, copies of quality control reports submitted to senior management, and management responses.
11. Describe the method for ensuring compliance with state and federal laws and regulations. Make available for examiner review the procedures manual, work programs, and workpapers compiled by the person/department responsible for compliance.
12. Describe the insurance coverage in effect for the mortgage banking company and its officers and the date it was last reviewed by the board of directors.
13. Recap all mortgage banking–related legal claims/lawsuits in excess of $1 million. Indicate the nature of any legal reserve that is maintained and the method used to assess reserve adequacy.
14. Describe the system for logging, tracking, and responding to customer complaints. The customer complaint file should be made available for examiner review while on-site.
15. Provide a copy of the disaster recovery plan and describe safeguards in place to protect loan documents and data processing input records.

Production and Correspondent Lending Data

16. Provide detailed organization charts for departments within the company which relate to the production function (i.e., retail originations, wholesale purchases, processing, underwriting, closing, shipping).
17. Provide information on the total number and dollar amount of loans generated by the following sources during the two most recent fiscal years and the interim year-to-date period. For purchased loans, please specify the method of purchase (i.e., bulk versus flow), program name, and amount subject to recourse back to either the seller or the investor):

    a. originated by the mortgage banking company

    b. purchased from affiliates

    c. purchased from nonaffiliated third parties
18. Provide written policies and procedures manuals that describe traditional and nontraditional mortgage products, underwriting standards, closing and funding procedures, exception reporting practices, management and employee compensation methods, and training programs for loan production personnel. State methods used to establish ongoing compliance with written policies and procedures and provide copies of relevant management exception reports.
19. Describe the credit approval process used for in-house originations. Include information on rate commitment options extended to the borrower, the average length of the commitment period,

controls that are in place to monitor fallout caused by processing backlogs, and procedures for expired commitments.

20. Provide details on the correspondent lending program, including a list of approved institutions and copies of the most recent loan-quality reports. Describe the credit review process before purchase and any controls that are in place to protect the mortgage banking company against future losses on loans purchased from affiliates and from correspondents.
21. Determine whether rate-locks are provided to correspondents on best effort production programs. What methods are used to verify reported loan fallout?
22. Provide information on the average income and cost per origination and compare with industry standards. Describe the method of accounting used for origination fees and other related noninterest income and expenses.
23. If the mortgage banking company is a subsidiary of a state member bank or sells loans to a bank affiliate that is subject to Regulation O, furnish a list of extensions of credit to ‘‘an executive officer, director, or principal shareholder’’ (as defined in section 215.2 of Regulation O) of—
    a. the state member bank;
    b. a bank holding company of which the state member bank is a subsidiary;
    c. any other subsidiary of that bank holding company;
    d. a company controlled by an insider, as defined by Regulation O; and
    e. a political or campaign committee that benefits or is controlled by an insider as defined by Regulation O.

    For all such extensions of credit, include the amount, date the loan(s) was originated or renewed, interest rate, collateral requirements, total amount of loans outstanding to that individual or company, and date of approval by the board of directors. Also include the aggregate amount of loans outstanding to all such insiders as of the inspection date in relation to the bank’s unimpaired capital and unimpaired surplus as defined in Regulation O. (See subsection 2050.0.3.2.)

Marketing and Hedging Data

24. Provide detailed organization charts for departments within the company that relate to the marketing and hedging functions. Describe management’s roles and responsibilities with respect to the sale of loans in the secondary market, asset securitization, funding, liquidity risk management, interest-rate risk management, and interaction with the asset/liability management function at the parent company.
25. Provide a copy of written policies and procedures used to hedge interest-rate risk associated with the pipeline and closed-loan warehouse. Describe any parameters and limits that are in place and provide a list of securities dealers with whom management is authorized to conduct business.
26. Provide management reports on pipeline and closed-loan (warehouse) inventory volume, mix, yield, age, and turnover as of the inspection date. Describe the method used to project fallout and any models that are used to determine the sensitivity of the pipeline to interest-rate fluctuations.
27. Indicate the methods used to securitize loans for sale in the secondary market, including the use of third-party guaranties and other forms of credit enhancement. Are securities generally sold or retained on the balance sheet?
28. Provide information on the number and volume of securities that lacked final pool certification as of the inspection date. State whether this volume is in compliance with investor guidelines. If

applicable, indicate whether the requirements for obtaining a letter of credit or other guaranty have been satisfied.

Servicing Data

29. Provide a detailed organization chart for the servicing department.
30. List subservicers and vendors who are employed to perform servicing functions. Briefly describe the nature of the services provided.
31. Indicate whether any contracts with subservicers and/or vendors have been terminated for cause since the prior inspection.
32. Provide the monthly servicing management reports since the prior inspection, including the number of loans serviced, dollar volume, and composition of the servicing portfolio in terms of product mix, average loan size, weighted average coupon rates, weighted average maturities, geographic location, and delinquencies and foreclosures.
33. Provide a list of investors for whom servicing was performed as of the most recent quarter-end. Identify any recourse or repurchase provisions and/or forbearance requirements.
34. State whether any investors have terminated servicing contracts with the mortgage company and/or its affiliates for cause since the prior inspection, or if any are likely to be terminated in the near future.
35. Provide a list of all major bulk purchases and sales of servicing since the prior inspection. Identify the terms of each sale and any resulting gains or losses.
36. Provide a list and aging of all outstanding advances to investors as of the date of inspection.
37. Provide access to the servicing policies and procedures manual. Indicate the frequency with which manuals are updated. How does management ensure that subservicers and vendors comply with these same policies and procedures?
38. Provide a servicing-fee schedule (in basis points) for conventional, government, and nontraditional loans serviced for third parties.
39. Provide copies of management reports used to track portfolio runoff.
40. Provide a loan delinquency report segmented into 30, 60, 90, 120, and 180 foreclosure categories. Indicate the volume and number of loans in each segment by loan type. Also include information on the number and dollar volume of delinquent loans that were purchased out of investor pools.
41. Detail the number and dollar volume of other real estate (ORE) parcels segregated by company-owned and investor-owned. Provide a list of loans in foreclosure for which action has been delayed, if applicable.
42. Provide access to the customers' complaint file so that examiners can review it while on-site.

Financial Data

43. Provide copies of the Report of Condition and Income and/or Y-series report that was filed by the mortgage banking company for the two previous fiscal years and the most recent interim period.
44. Provide an internally prepared balance sheet and income statement that reconcile with the most recent Report of Condition and Income and/or Federal Reserve Board Y-series report.

45. Provide the latest published financial statements, if applicable, including the annual report, SEC 10K, 10Qs, and any press releases.

46. Provide copies of the accounting policies pertaining to mortgage loans, securities, and other assets held for sale and held for investment. Also provide copies of management reports that monitor compliance with SFAS No. 115 (securities), the current SFAS No. 65 (loans), SFAS No. 125 (mortgage-servicing assets), and internal policies as of the close of business of the most recent quarter.

47. Provide details on all formal and informal funding mechanisms, including but not limited to repurchase agreements, commercial paper programs, and debt issuance facilities. Indicate the counterparties, where applicable; the amount uncommitted; and the amount outstanding under each facility as of the close of the most recent quarter. Provide copies of all formal and informal written agreements.

48. Provide copies of credit agreements for all funding lines from affiliated and nonaffiliated institutions. Describe methods used to monitor the credit quality of all funding sources. The following information should be included:

    a. lending bank (include copies of confirmation letters)

    b. total credit line

    c. amount in use as of the inspection date

    d. amount available for use and by whom

    e. expiration date

    f. compensating balance and/or fee arrangements

    g. purpose

    h. whether the credit lines are contractual obligations of the lenders

    i. reciprocity arrangements, if any

    j. collateral requirements

    k. legal opinions evidencing compliance with sections 23A and 23B of the Federal Reserve Act, as amended

49. Provide copies of any contingency planning documents that outline alternative courses of action should the condition of traditional funding sources deteriorate.

50. Provide a copy of any standardized financial presentations made to the executive management team and to the board of directors.

51. Provide a copy of standardized management reports used to measure and track the quality of originated, purchased, and serviced assets. Include an aging report that identifies loans that are past due 30, 60, 90, 120, and 180 or more days and indicate whether such loans are *held for sale, held for investment,* or *serviced for investors*.

52. Provide a copy of internal policies that apply to loans held for investment. Indicate the date each loan that was on the books as of the most recent quarter-end was transferred to this account, its amortized cost, market value, and any write-downs or adjustments to yield at the date of transfer. Indicate the person responsible for reviewing these loans for collectibility, the frequency of such reviews, and any adjustments or write-downs taken over the past year.

53. Provide detail pertaining to the transfer or sale of assets between the nonbank mortgage banking company and affiliated entities since the last inspection and that supports the FR Y-8 Reports. Also provide related documentation evidencing methods for asset valuation and credit-quality determination.

54. Provide detail on the allowance for loan and lease losses, contra asset valuation allowances, and

other reserve accounts as of xx/xx/xx (fiscal) and xx/xx/xx (interim). For each account in use, provide a copy of the most recent analysis and a description of the applicable loan and other losses provisions reserving methodology.

55. Provide a copy of the company's policy with respect to real estate appraisals.
56. Provide a copy of management reports that are used for liquidity, funding, and asset/liability management. If these activities are coordinated with affiliate bank or parent bank holding company personnel, provide copies of the information that is routinely provided.
57. Indicate the method for assessing capital adequacy at the mortgage company level. Provide a copy of the company's capital and dividend policies, as well as a list of dividends paid to shareholders during the two previous fiscal years and the most recent interim period. Are any changes in the level of dividends planned or anticipated?

Mortgage-Servicing Assets

58. Provide an organization chart highlighting those areas and individuals responsible for the recording, measurement, and impairment testing for originated and purchased mortgage-servicing rights (MSAs).
59. Provide an inventory listing of all MSAs as of the close of business of the most recent quarter.
60. Discuss the various loan-origination and -purchase programs that give rise to MSAs; the method for calculating and communicating the price paid to correspondents and brokers for service release premiums; whether MSAs are recorded on table-funded loans; and the details on any bulk purchases since the previous inspection, including the price paid and yield realized.
61. Discuss the various loan-sale programs that give rise to MSAs, the method for calculating and recording the initial value of MSAs.
62. Provide a copy of detailed written policies and procedures regarding the initial recording, amortization, and periodic revaluation and impairment testing for MSAs. Indicate the management and/or board committee responsible for approving such policies and the date of last approval.
63. Provide detailed information on any valuation models used for MSA revaluations and a copy of the output as of the most recent quarter-end. Indicate whether such revaluations are performed in-house or by an outside vendor and the frequency of such revaluations.
64. Reconcile fair market values of MSAs to their respective book values as of the most recent quarter-end. Provide a copy of management reports and related journal entries used to record amortization adjustments and/or write-downs.
65. Provide copies of worksheets used to calculate the amount of MSAs included in Tier 1 capital for regulatory reporting purposes as of the most recent quarter-end.
66. Furnish copies of any management reports or presentations to the board of directors or a committee thereof regarding the risk characteristics of MSAs, business risk analysis, and methods used to hedge the interest-rate and prepayment-rate risks associated with capitalized MSAs.
67. Provide an organization chart highlighting those areas and individuals responsible for hedging the interest-rate and prepayment-rate risk associated with MSAs.
68. Provide information on any financial instruments used to hedge interest-rate and prepayment-risk associated with MSAs. Include a detailed prospectus on any customized hedge products that are purchased from investment bankers and a statement from either internal or external accountants on whether such instruments qualify for hedge accounting treatment under SFAS No. 80.

69. Provide a copy of management reports that identify the number of contracts or instruments used, their current market value, and the degree of correlation between the hedge instrument and the underlying MSAs being hedged. Such reports should demonstrate the effectiveness of the hedge under varying market conditions.

70. Provide information on the number and dollar volume of servicing rights sold during the most recent fiscal year and interim period.

71. If mortgage-servicing assets are sold, provide information on the number and dollar volume sold during the most recent fiscal year and interim period.

Intercompany Transactions

72. Provide an organizational chart on a legal-entity basis that includes the bank holding company and all directly held bank and nonbank affiliates.

73. If the mortgage banking company is a direct nonbank subsidiary of the bank holding company, describe the method for identifying transactions that constitute ‘‘covered transactions’’ under sections 23A and 23B of the Federal Reserve Act, as well as the method for applying quantitative limits for section 23A and 23B purposes.

74. Provide a current listing of collateral that is maintained for covered transactions. Indicate whether collateral is maintained for the full amount of any credit lines with the bank and whether any depreciated or matured collateral has been replaced since the previous review.

75. Provide copies of any purchase and funding contracts between the mortgage banking company and affiliated bank(s). Please address whether any or all of the following conditions are met and/or provide written support, where applicable:

    a. asset purchases by the bank have been reviewed by management and are either within the quantitative limits of section 23A or meet the exemption requirements of section 250.250

    b. all purchases are at fair market value and consistent with market terms as required by section 23B

    c. no low-quality assets were transferred to a bank affiliate since the previous inspection

    d. the method of compensating bank affiliates for balances maintained by the parent company or its nonbank subsidiaries and the net interest income earned on warehouse loans or lines is reasonable and based on market terms

76. Provide copies of any servicing contracts between the mortgage banking company and affiliate bank(s). If not so stated, indicate the following information:

    a. the capacity in which the affiliate is acting (for example, is it acting as principal on its own behalf or as an agent for the affiliate bank?)

    b. the nature of all services provided

    c. billing arrangements, the frequency of billing, the method of computation and the basis for such fees

    d. the date of last review and approval by the mortgage banking company’s board of directors

77. Provide a copy of the bank holding company’s policy statement on the prohibition of tie-in arrangements, a description of training that is provided to employees in this area, and an attestation as to whether the nonbank subsidiary is in full compliance with internal policy.

78. If the mortgage banking company charges management or other fees, describe the nature of the

fees, the method of computation for such fees, and the settlement procedures. Include a listing of fees charged for the prior two fiscal years and the most recent interim period.

79. Provide a copy of the bank holding company’s intercompany tax allocation policy. Indicate the amount and timing of intercompany tax payments and credits received during the two previous fiscal years and the most recent interim period. If credits are due, please indicate the amount owed to the subsidiary and the date the intercompany receivable originated.

Sincerely yours,

Vice President,
Federal Reserve Bank of Boston

3070.0.12 APPENDIX B—ACCOUNTING LITERATURE

The following is a list of generally accepted accounting principles (GAAP) governing the mortgage banking industry that are in the form of accounting standards and interpretations. Accounting standards may change over time. Current accounting literature should be reviewed with management during each inspection.

Statements of Financial Accounting Standards (SFAS)

SFAS No. 5, ‘‘Accounting for Contingencies’’

SFAS No. 65, ‘‘Accounting for Certain Mortgage Banking Activities,’’ as amended

SFAS No. 77, ‘‘Reporting by Transferors for Transfers of Receivables with Recourse’’

SFAS No. 80, ‘‘Accounting for Futures Transactions’’

SFAS No. 91, ‘‘Accounting for Nonrefundable Fees and Costs Associated with Originating or Acquiring Loans and Initial Direct Costs of Leases’’

SFAS No. 115, ‘‘Accounting for Certain Investments in Debt and Equity Securities’’

SFAS No. 125, ‘‘Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities’’

FASB Technical Bulletin

Technical Bulletin No. 87-3, ‘‘Accounting for Mortgage Servicing Fees and Rights’’

Emerging Issues Task Force (EITF)

Issue No. 85-13, ‘‘Sale of Mortgage Service Rights on Mortgages Owned by Others’’

Issue No. 85-26, ‘‘Measurement of Servicing Fee under FASB Statement No. 65—When a Loan Is Sold with Servicing Retained’’

Issue No. 85-28, ‘‘Consolidation Issues Relating to Collateralized Mortgage Obligations’’

Issue No. 86-38, ‘‘Implications of Mortgage Prepayments on Amortization of Servicing Rights’’

Issue No. 86-39, ‘‘Gains from the Sale of Mortgage Loans with Servicing Rights Retained’’

Issue No. 87-25, ‘‘Sale of Convertible, Adjustable-Rate Mortgages with Contingent Repayment Agreement’’

Issue No. 87-34, ‘‘Sale of Mortgage Servicing Rights with a Subservicing Agreement’’

Issue No. 88-11, ‘‘Allocation of Recorded Investment When a Loan or Part of a Loan Is Sold’’

Issue No. 89-4, ‘‘Accounting for a Purchased Investment in a Collateralized Mortgage Obligation Instrument or in a Mortgage-Backed Interest-Only Certificate’’

Issue No. 89-5, ‘‘Sale of Mortgage Loan Servicing Rights’’

Issue No. 90-21, ‘‘Balance Sheet Treatment of a Sale of Mortgage Servicing Rights with a Subservicing Agreement’’

Issue No. 92-10, ‘‘Loan Acquisitions Involving Table Funding Arrangements’’

3070.0.13 APPENDIX C—REGULATORY GUIDANCE

The following is a list of sections in this manual that examiners may find particularly useful in the review of mortgage banking activities. Regulatory guidance also evolves over time. This list is not all inclusive.

2010.0.1	Policy Statement on the Responsibility of Bank Holding Companies to Act as Sources of Strength to Their Subsidiary Banks
2020.0–.7	Intercompany Transactions
2050.0	Extensions of Credit to BHC Officials
2060.0–.6	Management Information Systems
2065.2	Determining an Adequate Level for the Allowance for Loan and Lease Losses
2080.05	Bank Holding Company Funding and Liquidity
2080.0–.3	BHC Funding Practices
2125.0	Trading Activities of Banking Organizations
2126.0	Nontrading Activities of Banking Organizations
2126.1	Investment Securities and End-User Derivatives Activities
2128.02	Asset Securitization
2130.0	Futures, Forward, and Option Contracts
2150.0	Repurchase Transactions
3070.0	Section 4(c)(8)—Mortgage Banking
3080.0	Section 4(c)(8)—Servicing Loans
4000 sections	Financial Analysis
4030.0.2	Nonbanks (Analysis of Financial Condition and Risk Assessment)
4070.0	BHC Rating System

3073.0.1 EXPANDED STUDENT-LOAN-SERVICING ACTIVITIES

A bank holding company applied for the Board's approval under section 4(c)(8) of the Bank Holding Company Act (BHC Act) and section 225.23 of Regulation Y to expand the student-loan-servicing activities of its nonbank subsidiary. The activities would consist of—

1. providing student-loan authorities (the authority) with regular reports that include information in the aggregate and by individual lenders concerning the volume of loans being serviced for the authority and the volume of loans outstanding;
2. preparing projections for approval by the authority of student loans to be purchased and commitments to be issued in the future, based on the volume of loans being serviced and commitments outstanding, consistent with the amount of funds available to the authority as the result of its sale of bonds;
3. advising eligible lenders, borrowers, and other interested parties of the authority's student-loan-purchase program, including the criteria used by the authority in purchasing student loans and the extent to which the authority will be purchasing loans in the future based on the availability of funds; and
4. meeting regularly with the authority to advise it of the nonbank subsidiary's efforts in connection with the student-loan activities.

Under no circumstances would the nonbank subsidiary be authorized to bind the authority or its bank trustee to commit to purchase or actually to purchase student loans from eligible lenders.

The proposed activities were regarded as being equivalent to the activities of a mortgage banking subsidiary of a bank holding company, authorized under section 225.28(b)(1) of Regulation Y, with respect to acquiring and servicing mortgage loans for institutional investors or in connection with the secondary-mortgage market. The activities proposed and currently conducted by the applicant, to the extent that they were different from the services performed by any institution that services loans for others, were perceived as being different only in that they related to servicing student loans for a governmental authority. Banks and their nonbank subsidiaries generally provide comprehensive loan-acquisition and -servicing "packages" for investors in mortgage and other loans. The bank holding company's nonbank subsidiary was the nation's largest servicer of student loans, and was thus particularly well equipped to perform the proposed expanded services.

In addition to determining that the proposed activities were closely related to banking to approve the application, the Board had to conclude that the proposed activities would produce benefits to the public that would outweigh any possible adverse effects, such as unsound banking practices, unfair competition, conflicts of interests, or undue concentration of resources. The Board made that conclusion in addition to determining that the balance of public interest factors that it is required to consider under section 4(c)(8) of the BHC Act was favorable. Accordingly, the application was approved on July 1, 1985 (1985 FRB 725).

A bank holding company or its subsidiary may engage in the activity of servicing loans or other extensions of credit for either affiliated companies or for persons or institutions not affiliated with the holding company. The service will often be carried on as an additional activity of a credit-extending subsidiary, such as a mortgage company, where the loan serviced was originated by the subsidiary and subsequently sold to an investor. A servicing company provides the collection vehicle through receipt and disbursement of funds for investors who may not possess the resources to accomplish the activity. The purpose of servicing is to keep a sound loan in good standing for a passive investor. The servicing company's remuneration is usually based upon a percentage of the outstanding balance of the loan.

The traditional servicing arrangement arises from the normal business of a mortgage company. The company grants extensions of credit to qualified borrowers and subsequently packages and sells these loans, normally without recourse, to individuals or institutional investors who contract the collection of the credit to the mortgage company. The company may also purchase mortgages or other extensions of credit in the open market with the intention of reselling the credit and retaining the servicing or can simply purchase servicing portfolios (12 C.F.R. 225.132). The collection itself is basically a bookkeeping function.

Servicing loans for others is relatively risk-free to the company when the credits are sold without recourse to investors. A credit which has been sold with recourse represents an unusual circumstance and should, therefore, be reviewed in detail. The serviced loans will generally be high quality mortgages which are in turn purchased from the company by passive investors desiring a fixed rate of return on their funds. The risk to a servicing company lies in its portfolio of unsold loans, or its "warehouse." The risk is two-fold: (1) the loan may not be of high enough quality to attract an investor so that the servicing company will have to continue to carry the credit for its own account, and (2) the loan was made at an interest rate which is below current market rates. In the latter case, the servicing company must either sell the loan at a discount or continue to hold the credit for its own account. In either case, the loan is treated as an asset of the company and involves credit risk.

The inspection of a servicing company, or a servicing department of a credit-extending subsidiary, should focus on adequacy of documentation and controls, and on the quality and marketability of the warehoused loans. The examiner should obtain a past due report for the portfolio and note in the inspection report significant credits which are past due together with the period of delinquency, the type of loan, and the asset classification, if any. The nature of the servicing business is such that the number of past dues should be small because loans are only warehoused for a short period of time until they can be sold to an investor. As a rule, a past due loan or a current loan which has been warehoused for more than several months is indicative of some problem with the credit. Each loan should be evaluated to determine the reason it has not been sold.

During periods of rising long-term interest rates, the warehouse portfolio becomes subject to the risk that a loan may not be marketable, except at a discount, because of its relatively low yield. This affects both the servicer's income and liquidity.

In the case of the parent company acting as a servicer, the inspection should also determine whether the activity is being carried on under the proper exemption. A bank holding company may act as a servicer under section 4(c)(8) of the Act or under the provisions of sections 4(a)(2) and/or 4(c)(1) of the Act. If carried on under Section 4(a)(2) of the BHC Act, the holding company is limited to servicing loans only for its own account or its banking and nonbanking subsidiaries. If carried under Section 4(c)(1)(C) of the BHC Act, the bank holding company is limited to servicing loans only for its own account or its banking subsidiaries.

Finally, the income of the company should be subject to scrutiny. A servicing company should be a profitable business. The servicer receives a fee based upon a percentage of the outstanding balance of the loan. In the early years of the payback period, the fee should significantly exceed the cost of the service, and because much of the portfolio will be refinanced either prior to its maturity or prepaid, the fee income should be sufficient to cover the servicer's cost plus profit. The reason for poor earnings in this activity is generally either inefficiency in the collection area, failure to attain the breakeven point of servicing volume, or the inability to turnover the warehouse portfolio often enough to maintain new fee generation. In the event that the servicer is unprofitable, the examiner should determine the reasons and clearly set them forth in the inspection report.

The servicing arrangement is of a fiduciary nature and as such it gives rise to certain contingent liabilities. In the situation where the servicer is not fully and properly discharging its servicing responsibilities in accordance with the servicing agreement, the holder of the serviced notes might bring legal claims against the servicer. The inspection process should direct attention to this area including a review of the servicing agreement and verification that the servicer is fulfilling its obligations. Management should be reminded of the significant loss exposure which can result from improper attention to its fiduciary responsibilities.

3080.0.1 INSPECTION OBJECTIVES

1. To determine that internal controls are adequate to administer effectively the servicing of the loan portfolio.

2. To determine the level of exposure to credit risk of loans held for the firm's own account.

3. To determine if the firm's earnings are sufficient so as not to be a burden on the parent or subsidiary bank.

3080.0.2 INSPECTION PROCEDURES

1. Review the balance sheet to determine the volume of credits held for the firm's own account and evaluate their asset quality.

2. Review internal controls and evaluate their adequacy.

3. Review earnings and appraise the impact on the parent and bank subsidiaries.

4. Review servicing agreements and evaluate the potential or contingent risks to which the firm is exposed in the event of failure by a borrower to service its loan properly.

5. Determine whether mortgage servicing rights are recorded as an asset and whether they are being amortized over the average life of the loans being serviced.

A bank holding company may engage under contract with a third party in the management, servicing, and collection[1] of the types of assets that an insured depository institution may originate and own. The company cannot engage in real property management or real estate brokerage services as part of these services. See Regulation Y, section 225.28(b)(2)(vi). Provided below are some initial historical examples of Board orders that involve asset-management services related to this nonbanking activity. The commitments and conditions provided for within the Board orders should not be considered to be currently applicable.

3084.0.1 ASSET-MANAGEMENT SERVICES TO CERTAIN GOVERNMENTAL AGENCIES AND UNAFFILIATED FINANCIAL INSTITUTIONS WITH TROUBLED ASSETS

Three bank holding companies (the applicants) applied for the Board's approval under section 4(c)(8) of the BHC Act to engage de novo in providing asset-management services to the Resolution Trust Corporation and the Federal Deposit Insurance Corporation, and generally to unaffiliated financial institutions with troubled assets. The applicants committed to conduct these activities under the same terms and conditions as set out in 1988 FRB 771.

The commitments and conditions of this order required that (1) the asset-management activities would be provided to the banks and savings associations, (2) the applicant would obtain the Board's approval before providing asset-management services for pools of assets that were not originated or held by financial institutions and their affiliates, (3) the applicant would cause its asset-management subsidiary to establish procedures to preserve the confidentiality of information obtained in the course of providing asset-management services, and (4) neither the applicant nor its management subsidiary would take title to the assets managed by the asset-management subsidiary.

The applications of these holding companies were approved by a Board order on December 24, 1990 (1991 FRB 124). Two additional orders about providing asset-management services were approved on March 25, 1991 (1991 FRB 331 and 334).

3084.0.2 ASSET-MANAGEMENT SERVICES FOR ASSETS ORIGINATED BY NONFINANCIAL INSTITUTIONS

Two bank holding companies (the applicants) applied jointly for the Board's approval under section 4(c)(8) of the BHC Act to engage de novo in collection-agency activities pursuant to Regulation Y through a joint venture. The Board concluded that the collection activities were permissible.

The bank holding companies also applied for the Board's approval to engage in asset-management, asset-servicing, and collection activities through a nonbank of the joint venture located in New Jersey. The subsidiary would provide asset-management services to the Resolution Trust Corporation (RTC) and the Federal Deposit Insurance Corporation (FDIC). It would also provide these services to unaffiliated third-party investors that purchase pools of assets assembled by the RTC or the FDIC. Under the proposal, neither the applicants nor this nonbank subsidiary would acquire an ownership interest in the assets that they manage or in the institutions for which they provide the asset-management services. The applicants further committed that they would not provide real property management or real estate brokerage services as part of the proposed activities.

The Board previously determined that, within certain parameters, providing asset-management services for assets originated by financial institutions (banks, savings associations, and credit unions) and their bank holding company affiliates is an activity closely related to banking (see 1991 FRB 331, 334 and section 3600.15.3). The applicants proposed to conduct all asset-management activities subject to the same conditions as in the Board orders previously cited.

The applicants proposed to engage in asset-management activities for assets originated by nonfinancial institutions as well as by financial institutions. These assets include real estate, consumer, and other loans; equipment leases; and extensions of credit. Assets of nonfinancial institutions include pension funds, leasing com-

1. Asset-management services include acting as agent in the liquidation or sale of loans and collateral for loans, including real estate and other assets acquired through foreclosure or in satisfaction of debts previously contracted.

panies, finance companies, and investment companies formed to engage in asset-management activities. The managed assets would be limited to the types of assets that financial institutions have the authority to originate. The Board concluded that the applicants would have the expertise to engage in managing these types of assets, regardless of the originating entity. The Board also determined that the proposal was consistent with the asset-management proposals approved in its prior orders. The Board concluded that the applicants' proposed activities are closely related to banking and approved the order on December 21, 1992. (1993 FRB 131)

Section 4(c)(8) of the BHC Act (Receivables) Section 3090.0

Two nonbanking activities authorized under section 4(c)(8) of the BHC Act, per Regulation Y in section 225.28(b)(1), are the discount purchasing of a client's accounts receivables (factoring) and the establishment of a revolving credit facility secured by an assignment of accounts receivable (accounts receivable financing). These activities date back to Board orders issued in 1951. See sections 3090.1 and 3090.2.

3090.1.1 INTRODUCTION

Factoring is the discount purchasing of the client's accounts receivable invoices for goods that have been manufactured and shipped. Factoring differs from accounts receivable financing in that the factor assumes the credit risk of collecting payment from the recipient of the goods. The principal advantage of factoring is that the client is assured of the collection of the proceeds of its sales, regardless of whether the factor is paid.

A factor generally offers four basic services: (1) credit investigation and approval; (2) buying the client's accounts receivable at a discount (generally between .75 and 1.5 percent) after shipment of the goods to which there is no subsequent claim, just a claim against the invoices; (3) bookkeeping in the form of posting accounts; and (4) advancing funds in the form of an "open account" when there could be 30 days between shipment and payment. The later allows the client to replenish inventory loans for working capital or expansion.

Maturity factoring and advance factoring are the basic techniques of the industry. In maturity factoring, an average maturity due date is computed for the receivables purchased during a period and the client receives payment on that date. Advance factoring uses the same computations, however, the client has the option of taking advance payments equal to a percentage of the balance due at any time *prior* to the computed average maturity due date. The unadvanced balance, sometimes called the "client's equity," is payable on demand at the due date.

The factor's balance sheet reflects the purchases as "factored receivables" and the liabilities as "due to clients." Usually the due to clients balance will be significantly less than the factored receivables balance because of payments and advances to the clients. The income statement will show factoring commissions, which represent the discount on the receivables purchased. Interest income for advances on the due to client balances may or may not be a separate line item.

The factor is a pivoting point between the buyer and the seller. The buyer must pay or all parties lose. Also the seller must have a reputation for delivering quality merchandise. The factor must know the business well enough to account for sudden increases in returns for out-of-specification merchandise or for merchandise of low quality. If the seller does not perform adequately, payment for the goods may not be forthcoming, and if bankruptcy threatens the seller, buyers may hold back their future purchases.

3090.1.2 FUNDING

Since factors traditionally provide financing to industries with seasonal borrowing requirements, such as textiles, shoes, clothing, and other consumer goods, their own funding programs will usually reflect this volatility. It may be expected that factors generally will have greater access to short-term unsecured credit facilities than would be expected for other nonbank activities. This would hold true for factors funded solely from internal sources as well as external sources.

Because of a factor's inherent funding volatility, a major portion of a factor's liabilities will be short-term debt. For the internally funded company, this source will be predominantly commercial paper proceeds from the parent company, with perhaps some bank line proceeds intermixed. The externally funded company will probably rely on bank lines for its short-term needs, usually with the parent company's guaranty of the debt.

Longer term funding may be provided through bank term loans and subordinated debt, although the volume of this type of debt appears to be low relative to other financing industries. The terms and covenants of long-term debt appear to allow for relatively more flexibility in operations and more highly leveraged positions than similar debt for other financing industries in recognition of the volatility of factoring operations and the liquidity of factoring assets.

The principal suppliers of senior and subordinated funds to factors and accounts receivable financers appear to be limited to a few insurance companies that specialize in this field, although a few banks also provide senior term funding. These lenders have incorporated their perceptions of acceptable balance sheet ratios and earnings performance into their debt agreements as restrictive covenants. Since comparative industry data is limited, these restrictive covenants may be the examiner's primary means of evaluating leverage, loss reserves, and capital adequacy. The "due to clients" account is another significant measure of a factor's liabilities. As noted before, the account represents the accumulation of the amounts payable to the clients upon the maturity of their factored receivables. This liability is, to a large extent, self-liquidating through the collection of those receivables.

An analysis of the changes in the relative proportions of the ''due to clients'' account should provide valuable input into the analysis of a factor's earnings. Since factoring is a highly competitive industry, price cutting has reduced factoring commissions to a point where they provide minimal support to earnings; therefore, the interest margins on factoring advances have a significant impact on net income. The implication of the analysis of proportional changes is that as more clients take advances (reducing ''due to clients''), profit margins should widen, and conversely, as the ''due to clients'' proportion of total liabilities rises, profit margins may be expected to narrow.

3090.1.3 INSPECTION OBJECTIVES

1. To determine whether the company is operating within the scope of its approved activities and within the provisions of the Act and Regulation Y.
2. To determine whether transactions with affiliates, including banks, are in accordance with applicable statutes and regulations.
3. To determine the quality of the asset portfolios, and whether lending, monitoring and collection policies are adequate to maintain sound asset conditions.
4. To determine the adequacy of the reserve for loan losses and whether the asset charge-off policy is appropriate.
5. To determine the viability of the company as a going-concern, and whether its affiliate status represents a potential or actual adverse influence upon the condition of the consolidated corporation.

3090.1.4 INSPECTION PROCEDURES

The inspection procedures for a factor have been divided into two phases, preliminary and on-site, when considered necessary.

The preliminary phase entails the gathering and analysis of information at the parent company in order to determine the scope of the field work to be performed on-site. The on-site segment of the procedures expresses some of the typical practices and considerations in this form of financing.

During the preliminary phase, the following information should be reviewed:

1. System approvals for offices and activities, including stipulated public benefits;
2. Financial statements, both interim and fiscal, for a sufficient period to determine trends and operating patterns;
3. All management reports which should indicate problem loans, loan volume, new accounts and other reports regarding loan portfolio and company status;
4. External debt instruments to determine material restrictive covenants;
5. Internal audit reports and workpapers;
6. Minutes of the board of directors, executive committee and loan committee, if available at the parent company;
7. The results of a parent company loan review, if any.
8. To be requested:
   a. Schedules of past due loans, intercompany participations, and large loans;
   b. Schedules of problem accounts, liquidating accounts, and repossessed assets;
   c. General ledger trial balance;
   d. Loan trial balance, including overadvances;
   e. Statements of company lending, accrual, and other policies;
   f. Reconcilement of the loan loss reserve for the period between inspections;
   g. Listing of common borrowers between affiliates.

3090.1.4.1 On-Site Procedures

After reviewing the material available at the parent company, including the audit review, a decision whether to go on-site is in order. Some of the determinants of this decision are relative size, current earnings performance, overall contribution to the corporation's condition, asset quality as indicated by internal loan review reports and problem loan reports, and the condition of the company when last inspected. From the information provided, it might be determined that the company is operating properly and is in apparently sound condition. In such a case, an on-site inspection may not be warranted. Conversely, a deteriorating condition might be detected which would require a visit, even though a satisfactory condition had been determined during the previous inspection. Subsidiaries in unsatisfactory condition should be inspected each time the parent company is inspected.

The following comments provide a general outline of the factor's basic operation. This outline will provide a background for the comments in the inspection procedures.

While the typical factoring agreement stipulates that all accounts receivable of a client are assigned to the factor, not all are purchased without recourse. The agreement between the factor and the client will usually state that receivables subject to shipping disputes and errors, returns, and adjustments are chargeable to the client because they do not represent bona fide sales. In addition, sales made without the factor's approval are considered *client risk* receivables, with full recourse to the client if the customer fails to pay.

The usual approval process requires the client to contact the factor's credit department before filling a sales order on credit terms. The credit department will research its files, determine the credit worthiness of the customer, and approve or reject the sale. As stated before, if the credit department rejects the sale, the client may complete the sale, but at its own risk. The most common reasons for rejection are sales to affiliates, sales to known bad risks, sales to customers whose credit cannot be verified, and sales to customers whose outstanding payables exceed the factor's credit line.

Once a sale has been made and the receivable assigned to the factor, approved or not, the client's account will be credited for the net invoice amount of the sale. That is, any trade or volume discounts, early payment terms, and other adjustments are deducted from the invoice amount. The receivable then becomes part of the client's "availability" to be paid in advance or at the computed due date, depending upon the basis of the factoring arrangement.

Each month the client will receive an "accounts current" statement from the factor which details the transactions on a daily basis. This statement will reflect the daily assignments of receivables, remittances made, deductions for term loans, and interest charges and factoring commissions. Credit memos, client risk, charge backs, and other adjustments will also be shown. Client risk charge backs are the amounts deducted from the balance due to the client upon the failure of customers to pay receivables factored at client risk.

The accounts current statement and the availability sheets will be necessary for the asset analysis process. Considering the volume of transactions, the accounting system that develops this data will probably be automated, which may allow the factor to obtain comparison and monitoring data on the client. If a monitoring system is in place, the data provided will be valuable in the asset analysis process.

The evaluation of a factor includes a review of its systems and controls as well as an analysis of the quality of its assets, both of which may be accomplished by a two segment analytical approach. A major portion of a factor's assets will be factored receivables, for which the credit department has the responsibility for credit quality and collection. The other major portion of the assets will be the client loans and credit accommodations, for which the account officers are responsible. The procedures for each area will be dealt with separately.

3090.1.4.2 Credit Department

Because of its integral function in the credit and collection process, the credit department is the heart of a factor. The department maintains credit files, which are continually updated as purchases are made and paid for by the customers. These files will include financial statements, credit bureau reports, and details of purchasing volume and paying habits. Usually, each customer will have an assigned credit line, which is the credit department's estimate of the customer's credit capacity.

The evaluation of this department should take the form of a review of a sample of the customer files. The sample may be drawn from lists of large volume customers and closely monitored customers, or it may be a random sample. The examiner should have either a copy of departmental policies and procedures or a verbal understanding of them prior to the review. It should be kept in mind that the objective of the review is to critique the credit and collection process and to verify departmental effectiveness, and not to obtain classifications.

3090.1.4.3 Asset Evaluation

Prior to the review of asset quality, the examiner should receive the lists of problem clients, client over-advances, term loans, and credit accommodations; as well as the aging schedule of factored receivables including client risk receivables. These will be used as the basis for selecting the clients to be reviewed. It is recommended that the selection be made from the list of clients with term loans, largest first, in addition to the acknowledged problems. Clients with high dilution rates and those with client risk receivables equal to 20 percent or more of factored volume may also be included.

It should be noted that a factor usually collects principal and interest payments directly from the client's availability, which means that the expected delinquency rate is minimal. Past due factored volume is not an effective measure of client quality.

A maturity client's availability is the sum of all factored receivables, less trade and other discounts, factoring commissions, credit memos, and client risk charge-backs. There may also be other deductions for letters of credit and other credit accommodations. An advance client's availability would be further reduced by advances on the factored receivables, interest charges, and the reciprocal of the contractually agreed upon ''advance'' percentage. This reciprocal, 20 percent in the case of an 80 percent advance client, is sometimes referred to as the client's ''equity'' in the factored receivables. Availability may be increased by liens on additional collateral such as inventory, machinery and equipment, real estate, and other marketable assets.

The review and analysis of asset quality will be procedurally similar to that used in accounts receivable financing. However, certain aspects of the financial statements may need elaboration. The client's balance sheet will have a ''due from factor'' account instead of accounts receivable. The account balance may be somewhat lower than a normal receivables balance, which would affect turnover ratios and other short-term ratios. The difference relates to the client's ability to convert sales to cash faster with a factor than if the receivables were to be collected normally. In addition, the analysis of the statements should incorporate an assessment of the client's ability to absorb normal dilution and the potential losses associated with client risk receivables, particularly when these factors are higher than usual for the portfolio.

As a factor's systems and controls for client loans are somewhat similar to those for accounts receivable financing, the evaluation of asset quality must consider these factors before the classification of a client is made. While the typical client may have less than satisfactory financial statements, the factor's working knowledge of the client's operations and industry tends to mitigate the risk factors present.

For classification purposes, ''client risk receivables'' is the only portion of factored volume that is appropriate for use in the amount classified. Because of the recourse aspect the balance is considered as an indirect obligation rather than a direct obligation.

As a further step in the evaluation of the lending area and its controls, the evaluation of the steps taken and the results of at least one recent client liquidation should be made. By reviewing the chronology of events along with the loan and collateral balances, the effectiveness of systems and controls under extended circumstances may be assessed. The type of liquidation will have a bearing on the losses taken. Losses tend to be higher when client fraud is involved.

In the process of evaluating a factor's condition, the adequacy of systems and controls and the capability of management are considered significant measures. Asset quality, as measured by classifications, may be influenced by seasonal aspects and should be carefully analyzed to allow for such influences. Because of a lack of regular and consistent comparative data for the industry, earnings and capital adequacy are evaluated in terms of the company's own performance.

The review of the company's internal systems and controls should be continuous during the inspection. Considering the large volume of daily transactions that flows through a factor, any internal control that can be easily negated represents a potential problem and should be brought to management's attention. In the broad context, this review would include the credit controls for both clients and customers. Since credit problems can develop rapidly in factoring, credit controls and systems must be responsive to the identification of these problems. Deficiencies noted should be discussed with management and, if significant, cited in the report. The company's earnings trends may be evaluated by using a comparative yield on assets approach. By analyzing yields on asset categories from period to period the examiner will be able to make a judgment as to the efficiency of the systems. Factors are subject to the same price competition in the commercial finance market as accounts receivable financers. Declining portfolio yields may reflect the inroads made by competition and may indicate a decline in future profitability.

The subject of capital adequacy is influenced by the aforementioned seasonal characteristics. Over the period of a year, the comparisons of equity to assets and equity to liabilities will vary significantly. It is suggested that an average balance sheet be used to stabilize the variations.

In addition to balance-sheet ratio analysis, the effects of dividends and fees paid to the parent company on the capital accounts may be analyzed to determine the rate of internal capital generation. If the company is in a growth profile, or attempting to gain market share, the comparisons between fiscal periods may reflect a declining trend. Such a trend should be discussed with parent company management.

The report comments should summarize these considerations in a clear, concise presentation.

3090.2.1 INTRODUCTION

Accounts receivable financing is a revolving credit facility secured by an assignment of accounts receivable. As a financing technique, it allows the client (the financed company) to obtain working capital without waiting for customer payments. This form of financing is frequently used by companies with working-capital shortages, companies in seasonal industries, and companies with weak financial conditions. Typically, the funding requirements of these companies are in excess of any amounts that would be available through unsecured bank financing.

The financing process begins with a bona fide credit sale by the client and the assignment of the resulting receivable to the financer. Upon assignment, the financer advances a specific percentage of the receivable to the client. The loan is repaid by customers' direct payments or, in the case of a lockbox, by the remittance of the customer's payment to the financer, who returns the amount in excess of the loan to the client. While a simple concept for a single transaction, the operations of an accounts receivable financer become a complex process when many clients and perhaps thousands of receivables are involved.

Companies engaged in accounts receivable financing usually incorporate the full range of commercial financing activities into their operation. These activities would include inventory financing, loans secured by machinery and equipment, some forms of real estate loans, and loans secured by other assets. As a general statement, these companies will provide working-capital financing using almost any form of viable collateral to secure the loans. These additional activities are facilitated by the financer's in-depth knowledge of the borrowers' financial conditions and cash flows. This knowledge comes from the controls placed on the borrowers, such as periodic field audits, the flow of the borrower's cash through the company, and an internal staff that specializes in the financed industries.

3090.2.2 FUNDING

Accounts receivable financing companies, like factors, traditionally provide working-capital financing to seasonal industries. Consequently, the funding programs of these financing companies will reflect these variations in their increased use of short-term funds relative to other nonbanking activities.

Since many accounts receivable clients have seasonal businesses, a large portion of the financer's liabilities will be short-term debt. For internally funded financers, this debt will be predominantly commercial paper proceeds from the parent company, with perhaps some bank lines intermixed. The externally funded company will probably rely on bank lines for its short-term needs, usually with the parent company's guaranty of the debt.

Longer term funding may be provided through bank term loans and subordinated debt, although the volume of this type of debt appears to be low relative to other financing industries, another parallel to factoring. The terms and covenants of long-term debt appear to allow for more flexibility in operations and somewhat more highly leveraged positions than similar debt for other financing industries. This practice is apparently in recognition of the volatility of this form of financing and the liquidity of the assets supporting the financer's loans.

The principal suppliers of senior and subordinated funds to collateral lenders (factors and accounts receivable financers) appear to be limited to a few insurance companies that specialize in this field, although a few banks also provide senior term funding. These lenders have incorporated their perceptions of acceptable balance-sheet ratios and earnings performance into their debt agreements as restrictive covenants. Since comparative industry data are limited, these restrictive covenants may be the examiner's primary means of evaluating leverage, loss reserves, and capital adequacy.

3090.2.3 INSPECTION OBJECTIVES

1. To determine whether the company is operating within the scope of its approved activities and within the provisions of the act and Regulation Y.
2. To determine whether transactions with affiliates, including banks, are in accordance with applicable statutes and regulations.
3. To determine the quality of the asset portfolios and whether lending, monitoring, and collection policies are adequate to maintain sound asset conditions.
4. To determine the adequacy of the reserve for loan losses and whether the asset charge-off policy is appropriate.
5. To determine the viability of the company as a going concern, and whether its affiliate

status represents a potential or actual adverse influence upon the condition of the consolidated corporation.

3090.2.4 INSPECTION PROCEDURES

The inspection procedures for an accounts receivable company have been divided into two phases, preliminary and on-site.

The preliminary phase entails the gathering and analysis of information at the parent company in order to determine the scope of the field work to be performed on-site, if required. The on-site segment of the procedures expresses some of the typical practices and considerations in this form of financing.

During the preliminary phase, the following information should be reviewed:

1. system approvals for offices and activities, including stipulated public benefits
2. financial statements, both interim and fiscal, for a sufficient period to determine trends and operating patterns
3. all management reports which should indicate problem loans, loan volume, new accounts and other reports regarding loan portfolio and company status
4. external debt instruments to determine material restrictive covenants
5. internal audit reports and workpapers—
   a. internal control exception report to determine weaknesses and corrective actions,
   b. flow charts in the workpapers which will enable the examiner to become familiar with company systems, and
   c. additional internal reports may be identified which may assist the inspection on-site
6. minutes of the board of directors, executive committee and loan committee, if available at the parent company
7. the results of a parent company loan review, if completed
8. To be requested:
   a. schedules of past-due loans, intercompany participations, and large loans
   b. schedules of problem accounts, liquidating accounts, and repossessed assets
   c. general ledger trial balance
   d. loan trial balance
   e. statements of company lending, accrual, and other policies
   f. reconcilement of the loan-loss reserve for the period between inspections
   g. listing of common borrowers between affiliates

3090.2.4.1 On-Site Procedures

After reviewing the material available at the parent company level, including the audit review, a decision whether to go on-site is in order. Some of the determinants of this decision would include relative size, current earnings performance, overall contribution to the corporation's condition, asset quality as indicated by internal loan review reports and problem loan reports, and the condition of the company when last inspected. From the information provided, it might be determined that the company is operating properly and is in apparently sound condition. In such a case, an on-site inspection may not be warranted. Conversely, a deteriorating condition might be detected which would require a visit, even though a satisfactory condition had been determined during the previous inspection. Subsidiaries in unsatisfactory condition should be inspected each time the parent company is inspected.

The on-site inspection procedure will be similar to that used in a commercial department of a bank. Selection and evaluation of the assets, review of internal controls, identification of lending policies, and credit review procedures are all familiar areas to the examiner and do not need further explanation. However, the accounting and reporting systems are somewhat different and will require the examiner to become familiar with systems and policies before proceeding with the asset evaluation process.

3090.2.4.2 Accounting and Controls

There are two basic systems within the accounting and control environment of an accounts receivable company. The first system provides accounting and control for client loans and collateral balances and is frequently automated to handle the large flows of data generated in the operation. It is also common to find lockbox arrangements with banks that tie into the client system for the receipt of customer remittances. Such lockbox arrangements provide a greater degree of control over remittances.

The mechanics of the client system will be detailed in the internal audit file, which should also indicate the adequacy and efficiency of the system's controls. The audit file may also indicate the accounting techniques used and the client-monitoring reports that are generated by the system, such as dilution rates and trends, and year-to-year volume and operating comparisons. The client system provides the basic data for the company's accounting and control system. While the basic accounting considerations are outlined in the AICPA *Industry Audit Guide: Audits of Finance Companies*, there are certain accounting aspects which deserve additional treatment. In some cases where a group of related companies are clients, the financing arrangements may include cross-guarantees and cross-collateralization agreements. In these cases, the financer might utilize excess availability for some of the related entities to offset the over-advance of another entity. Another treatment that may be applied is the use of a ''reserve for liquidating accounts,'' which in some instances is a specific reserve for a problem account that reverses at least current period earnings for the account. This reserve is in addition to the allowance for bad debts and may not be an explicit balance sheet account, but an offset to gross loans outstanding.

3090.2.4.3 Definitions

While many of the following comments define certain routine accounting and control considerations for accounts receivable financing, certain of the concepts are necessary for proper evaluation of client quality (i.e., availability, dilution, over-advances, and advances on other collateral). These definitions are general in nature as is the terminology, however, the processes will be similar in almost every company.

Loans to the client are based upon a contractual percentage of the client's eligible receivables against which the financer has agreed to advance funds. Eligible receivables include all assigned receivables, less trade discounts, early payment discounts, contra-accounts (reciprocal sales between the client and customers), receivables past due beyond the eligibility period specified in the contract, and other adjustments. The advance percentage is determined by a number of factors which include the expected average dilution rate (disputed invoices, mis-shipped goods, returns and allowances, etc.) and the client's expected gross profit margin. As a general rule, lenders in this field try to finance only the cost of sales and not the client's profits.

Because this form of financing involves rapidly changing collateral balances, a high volume of customer payments, and frequent loan requests, the financer has to determine the client's ''availability'' (loanable funds) before advancing the loan. Availability is the total of eligible receivables times the advance percentage less credit memos and the current loan balance. Credit memos are adjustments to the customer's account for errors in the client's shipments (i.e., the quantity shipped was less than that ordered). It is the client's responsibility to provide this information to the financer on a daily basis. If there is sufficient availability, the requested amount is usually advanced. On occasion, the availability computation will show the client to be ''over-advanced,'' that is the loan balance exceeds the agreed percentage advance against collateral. This situation may have occurred because some receivables have become past due, or the financer may have authorized additional funds to meet some valid client requirement. As a rule, over- advance positions are usually subject to a quick paydown to reduce the loan balance to the original contractual terms.

At times, the availability computation will reflect additional collateral value in the form of inventories, machinery and equipment, and other assets, shown net of an advance percentage. These categories usually indicate term loans, secured by liens against the respective assets, which expand the collateral base and provide additional support to the client's working capital requirements. These term loans should not be confused with loans for the acquisition of such assets which might appear only in the client's monthly statement.

The accounts receivable financer charges interest on the daily cash borrowings of the client and accumulates these charges on the client's monthly statement. The total interest charge for advances on receivables and other loans is deducted directly from remittances received by the financer. Accordingly, the expected delinquency rate for an accounts receivable operation is low except for the rare loan which is paid directly by the client and other assets which formerly belonged to a defunct client.

3090.2.4.4 Over-Advances and Other Loans

It was indicated earlier that an over-advance represented funds advanced in excess of available loanable funds and that there are two basic causes for over-advances. Some over-advances occur because a portion of eligible receivables becomes past due and ineligible for advances. This condition is usually corrected by the assignment of additional receivables or receipt of customer payments, and therefore may exist only for a few days.

The other basic over-advance occurs when a client requires additional funds for valid business purposes, such as an inventory buildup at the beginning of a season. In such cases, the over-advance is set up as a very short-term loan and paid down rapidly out of the client's availability. While the policy for over-advances varies between financers, when they are permitted they are usually carefully analyzed by the internal credit committee and closely monitored until paid off.

If a client is involved only in receivables financing and has made an over-advance request, the financer generally will prefer to take a lien against inventory rather than make an unsecured over-advance. Regardless of the purpose of the inventory loan, the financer will advance only a small percentage of the inventory value (40 to 50 percent) to allow for shrinkage, spoilage and obsolescence of the collateral. While inventory liens are in effect, the field audit staff will partially verify the inventory during each audit.

While machinery and equipment may be pledged as additional collateral to support working capital loans during the business period, most client companies will also finance equipment purchases on a secured basis. In either case, the financer usually advances a percentage of the quick sale or auction value of the equipment as determined by an appraisal. During field audits, the presence of the equipment and appropriate lien tagging are verified by the field auditors.

On occasion, a lien on real estate is part of the pledged collateral. The real estate may be operating premises, land, or the property of the principal of the client. Such liens may occur when the client is acquiring new, or expanding old, operating facilities and is using the financing relationship to fund the project. However, in many cases the lien was taken to provide additional collateral for working capital loans. In either case, appropriate documentation and appraisals should be on file.

It should be noted that loans on real estate collateral are limited to those providing support to the primary business of the client. Loans to finance speculative real estate acquisitions, and unrelated commercial property are not considered to be the usual practice of this industry, and would be considered as not complying with the general activities of a commercial finance company, unless specifically approved.

3090.2.4.5 Asset Evaluation

In selecting the loans to be reviewed, the first group to be considered is the acknowledged problem accounts. The next sample should be drawn from accounts with high dilution rates, those with frequent or large over-advances, and those which constantly take down all of their availability. Participations, purchased or sold, between affiliates should also be included in the examiner's sample. While this approach may exclude some of the larger accounts, it is intended to include those accounts which are potential problems in the primary review group. Should the company have a monitoring system for potential problem accounts, the system should be used for drawing the review sample.

The principal tools for the review process should include: the credit file, the field audit file, the monthly statement for the inspection date, the availability sheet for the inspection date, and updated information for the interim period ending with the on-site inspection date. Within the credit file, the copies of the financing agreements will indicate the specific terms of the borrowing relationship: the pledged collateral; advance percentage; interest rate; guarantees; appraisals; and the required communications, such as monthly receivables agings, inventory and machinery and equipment certification, etc. The usual file information will also include management's analysis of the client's operations.

The field audit file will contain the audit reports originated by the financer's field audit staff. These reports are usually quite comprehensive, with a primary focus upon critical financial areas. As a minimum, the auditors will analyze trade payables, State and federal taxes, cash flows, inventories, and receivables. Particular attention is paid to the client's sales and shipping procedures in order to ascertain that valid invoices are being assigned to the financer. The client's accounting procedures are also analyzed to determine their effectiveness and accuracy. These reports represent a primary source of information regarding the general financial condition of the client.

The client's monthly statement and availability sheets represent spot information on the client's activity. Many clients operate in seasonal industries such as clothing and textiles. In such industries, a client will tend to use all of its availability, as well as seasonal over-advances, during its inventory buildup period, and will pay off the over-advances and may have excess availability during the sales and collection period. The examiner will have to analyze the client's current position with regard to its particular operating cycle. Over-advances granted to a client for valid reasons do not necessarily represent undue exposure or a substandard asset for the financer.

The financial statements of a client quite frequently reflect a ‘‘relatively unsatisfactory or weak’’ financial condition, with minimal working capital, high leverage, and uncertain earnings as prime ingredients. There have been cases where both deficit working capital and deficit net worth were in evidence, however, the financing relationship has continued to function properly. The financer can continue these relationships if the short-term factors (sales volume, receivables and inventory turnover, and current liabilities) are appropriate and the character of the principals warrants the exposure. Analysis of a financed client should emphasize the short-term analytical factors and the related trends in the evaluation of asset quality.

Such factors as the success of the selling season, availability of materials, and fad merchandising will have direct impact on the client's financial condition. While the loan may be adequately protected by pledged collateral, the ability of the client to continue operations may be affected by these short-term factors.

For classification purposes, the financer's controls will have to be considered in addition to weighing the degree and quality of collateral protection, short-term factors, and the client's ability to withstand any financial reverses that are evident. Clients with deficit net worth, past-due trade obligations, and delinquent taxes should be considered to be problems and appropriately classified. The ability of the financer to control the risk exposure in the portfolio will be an important consideration in determining whether to classify a specific loan.

3090.2.4.6 DPC Assets

In some companies, assets acquired from defunct clients remain in the loan account instead of being reclassified to another balance-sheet category. Usually, these assets are uncollected accounts receivable, inventory, and machinery and equipment which have not been liquidated. However, these assets may include securities, as well as business and personal real estate, which had been pledged as collateral. By retaining these assets in the loan category, effective liquidation of the respective assets may be delayed because they usually represent small dollar amounts. Apart from this consideration, classification as loans may disguise the fact that certain of the assets may be subject to provisions of Regulation Y and the act, such as control and retention considerations. Separate control of these assets is recommended.

It is common practice in the accounts receivable and factoring industry for the lender to require a pledge of client company stock by the principals, particularly in overextended situations. Additional pledges of securities owned by the principals may also provide added collateral. While such pledges are not precluded by Regulation Y and the act, once they become company assets they should be reviewed for control and retention purposes.

3090.2.4.7 Financial Condition

Secured lending relies upon the four C's of credit: the traditional Capital, Character, Capacity, and Collateral. Pragmatically, these lenders practice a fifth C, Control. In this context, control implies the continuous monitoring of the client's financial condition, continued evaluation of the collateral, constant contact with the client, and the adjusting of the credit accommodation to conform to the client's current situation. This control is the reason that the secured lender can maintain a proper and mutually profitable financing arrangement with the client.

It is to be expected that the typical portfolio may include clients with less than satisfactory financial conditions. Considering the controls imposed upon the borrowing relationships, the secured lender has compensated for some of the additional risk in the loans. The combination of field audits, collateral controls, and account officer contact can be expected to reduce the exposure to unsatisfactory clients to a minimum. However, clients do fail and losses may be taken in liquidating the account. The incidence rate of liquidations and the extent of losses taken may be an indicator of the effectiveness of company controls.

The earnings of an accounts receivable company are based upon loans carrying interest rates above prime, which means that loan volume is a major determinant of revenues. Because this industry is very competitive, loan pricing is frequently used to obtain new clients from other lenders in order to promote growth in loan volume. Increases in loan volume combined with declining interest margins may be an indicator of price competition that is yielding negative results. Analysis of client turnover may verify this possibility.

In summary, management's ability to control risk and achieve profitability is essential to the soundness of an accounts receivable operation.

The effectiveness of company policies, the expertise of the lending staff and field audit staff, and the adequacy of systems and controls are the expressions of this ability to control risk. Company profitability is a measure of management's ability to obtain satisfactory client quality and terms in a price-competitive environment. The examiner will have to balance these factors in assessing the condition of the company.

3100.0.1 INTRODUCTION

The basic activity of a consumer finance company is making installment loans to individuals and is permissible pursuant to section 225.28(b)(1) of Regulation Y and section 4(c)(8) of the BHC Act (the act). In most areas, a company may make these loans under one or more of the following licenses: consumer discount, small loan, sales finance, or second mortgage. Most of a company's activity will probably be direct cash lending, in which the borrower and the lender come into direct contact with one another in the credit-extension process. However, a significant volume of lending is done through third-party contact. This is sales finance lending in which the company purchases, or discounts, the loans originated by a durable goods dealer in daily retail sales activity. Second mortgage lending may be originated from either direct contact or through home-improvement contractors.

Most consumer finance companies offer credit-related insurance as part of their services, and may have a captive insurance subsidiary if they are large enough. Inspection considerations and procedures for reviewing credit-related insurance activities are covered in section 3170.0.

3100.0.2 FUNDING

In some holding companies, management has elected to use a conventional industry funding pattern to support its consumer finance company operations. This pattern makes use of long-term subordinated debt in a specific proportion to equity capital. The further addition of senior long-term and short-term debt is then limited by restrictive covenants incorporated into the subordinated debt agreements. These covenants also provide operating limits for management in such areas as the proportions of specific classes of assets, minimum levels of net worth to be maintained, and the maximum dividend payout allowable. Since the wording and limits of these covenants are negotiated between the borrower and the subordinated debt holder, generalizations regarding the usual terms are not practicable.

It appears that certain life insurance companies supply most of this subordinated debt to the consumer finance industry. Along with their general knowledge of the industry, these insurance companies police their loans by requiring periodic reports from the borrower and by sending teams of their people to review the borrower's operations. In a sense, this approach to funding represents regulation and control by market forces rather than by governmental intervention.

In other holding companies, management has elected to support these operations using holding company funding sources such as commercial paper and lines of credit. In using this approach, operating management is generally free from market restrictions on operations.

It is likely that most affiliated consumer finance companies will have a funding plan that falls somewhere between these two extremes. Since commercial paper generally carries a lower total cost than bank lines of credit, the examiner may find that the senior short-term debt component is almost completely supplied by the parent company. On the other hand, long-term debt may have been obtained directly, or with the parent company's guaranty, or it may have been borrowed from the parent company's sources—that is, the parent borrows from a third party and re-lends the proceeds to the subsidiary.

Since a large volume of consumer installment paper carries maturities of three years or more, the use of commercial paper proceeds with maximum maturities of 270 days warrants some comment. Securities Act Release No. 401 specifically recognizes this use of commercial paper as appropriate. Further information may be found in the Code of Federal Regulations, 17 C.F.R. 231.4412. Also see sections 2080.1 and 5010.16 for information on commercial paper.

3100.0.3 INSPECTION OBJECTIVES

1. To determine whether the company is operating within the scope of its approved activities and within the provisions of the act and Regulation Y.
2. To determine whether transactions with affiliates, including banks, are in accordance with applicable statutes and regulations.
3. To determine the quality of the asset portfolio, and whether lending, monitoring, and collection policies are adequate to maintain sound asset conditions.
4. To determine the adequacy of the reserve for loan losses and whether the asset charge-off policy is appropriate.
5. To determine the viability of the company as a going concern, and whether its affiliate

status represents a potential or actual adverse influence on the condition of the consolidated corporation or the subsidiary bank(s).

3100.0.4 INSPECTION PROCEDURES

After reviewing the material available at the parent company level, including the audit review, a decision whether or not to go on-site is in order. Some of the determinants of this decision would include relative size, current earnings performance, overall contribution to the corporation's condition, asset quality as indicated by delinquency reports and industry comparisons (detailed later in this section), and the condition of the company when last inspected. From the information provided, it might be determined that the company is operating properly and is in apparently sound condition. In such a case, an on-site inspection may not be warranted, providing that a fairly recent on-site inspection had been conducted. Conversely, a deteriorating condition might be detected which would require a visit, even though a satisfactory condition had been determined during the previous inspection. Subsidiaries in unsatisfactory condition should be inspected each time the parent company is inspected.

The inspection procedures for a consumer finance company have been divided into two phases: preliminary and on-site. The preliminary phase entails the gathering and analysis of information at the parent company to determine the scope of the field work to be performed on-site. The on-site phase establishes a minimum scope of the inspection at the main office, and includes considerations to be incorporated into a visit to field offices if the inspection scope is expanded to that degree.

During the preliminary phase, the following information should be reviewed:

1. system approvals for offices and activities, including stipulated public benefits
2. financial statements, both interim and fiscal, for a sufficient period to determine trends and operating patterns
3. all management reports which should indicate problem loans, loan volume, delinquencies, and other reports regarding loan portfolio and company status including the Robert Morris Associates' *Direct Cash Lending Questionnaire* and similar reports
4. external debt instruments to determine material restrictive covenants
5. internal audit reports and workpapers:
   a. internal control exception reports to determine weaknesses and corrective actions
   b. flow charts in the workpapers to become familiar with company systems
   c. additional internal reports may be identified which may assist the inspection on-site
6. examination reports of any state regulatory agencies having jurisdiction over the company's offices
7. minutes of the board of directors, executive committee, and any other such committee, if available at the parent company
8. the results of a parent company loan review or operations review, if conducted and available
9. the following items to be requested from management:
   a. detailed past-due schedules and intercompany participations
   b. schedule of problem accounts, liquidating accounts, and repossessed assets
   c. general-ledger trial balance
   d. loan trial balance
   e. policy statements on lending, accrual, and charge-offs
   f. reconcilement of the loan-loss reserve for the period between inspections
   g. organization chart
   h. listing of company offices with addresses and operating licenses

3100.0.4.1 On-Site Phase

The procedures of the on-site inspection are intended to evaluate management and its supervisory efforts, to determine the soundness and compliance with the company's operating policies, and to analyze the impact of these policies on the company's financial condition using ratio analysis. A thorough understanding of the policies and systems of the company is necessary for the examiner to accurately determine the company's condition.

During the initial period on-site, the examiner may obtain an overview of the company's systems by interviewing the key staff officers. These individuals can provide the examiner with the detailed reports, policy manuals, and other information necessary for the inspection.

3100.0.4.2 Policy Evaluation

Because of its large volume of transactions and the number of offices involved, the typical consumer company will maintain an extensive set of policy and procedure manuals which are intended to guide company personnel in their daily activities. During the review of these manuals, the examiner should bear in mind that liberal policies and procedures may allow the company to mask portfolio problems and reflect other than an accurate condition in its financial statements.

The principal policies to be considered cover such areas as:

1. extensions of credit;
2. treatment of delinquent accounts and partial payments;
3. loan renewals;
4. loan charge-offs;
5. provisions for loan losses;
6. bulk purchases of loans, for both credit and account purposes; and
7. treatment of deferred income.

After assessing the soundness of company policies, the next step is to test their implementation through a review of the company's supervisory structure.

3100.0.4.3 Evaluation of the Supervisory Structure

The effectiveness of the supervisory structure is a key element in the condition of a consumer finance operation. This system serves two functions: it communicates the policies to the field personnel, and it enforces those policies. Assuming that management's policies are valid, the effectiveness of this system will be partially reflected in the ratio analysis of the company. However, it may take close analysis to determine whether any poor ratios are due to inadequate policies or ineffective enforcement.

In order to evaluate the supervisory effort, the examiner may review a sample of the various supervisor's reports which are prepared after visits to the loan offices. The sample should represent a cross-section of the offices and supervisors in order to obtain a balanced view of the company.

A further evaluative step may be undertaken if there are sufficient resources available to the examiner. The on-site visits to selected loan offices may provide considerable input to the examiner in assessing supervisory effort. In selecting the offices to be visited, well-performing as well as poor-performing offices should be selected. Concentration on poor offices will result in a biased assessment of the supervisory effort and may result in an invalid evaluation of company policies. The selection of the offices may be made by using the number of policy exceptions cited, poor performance records, or local economic conditions as criteria.

3100.0.4.4 Detailed Procedures for an Office Visit

The following steps outline a general procedure for determining field compliance with company policies and assessing the effectiveness of the supervisory effort. The examiner may modify, eliminate, or expand any of these steps or may devise any procedure deemed appropriate under the circumstances present.

The review of loans on-site should be oriented toward confirming the implementation of company policies for delinquency, balance renewals, charge-offs, extensions, partial payments, collection, and loan approvals. This review is intended to be a test of compliance and not a review of specific assets for classification purposes.

1. Review the detailed delinquency report for the selected office for a short period before the inspection date, generally two or three months. Trace the well overdue loans through to resolution, pay-off, charge-off, or reinstatement. Check these loans against the loan register to determine whether new loans have been granted to these customers and if so, determine if they are in accordance with company policy.
2. Review the controls for charging off loans and determine the effectiveness of the collection and recovery effort.
3. Review the loans to present borrowers. While renewals are usually granted to the better customers, the examiner will find a volume of renewals (''under 10 percent new money advanced'' loans). In some companies, these ''under 10 percent new money'' loans represent efforts to rehabilitate borrowers with poor payment records due to ill health, unemployment, etc. However, the examiner may find that management is using this approach to adjust and control delinquency and loss rates. There should be sufficient internal controls present to prevent the continuous renewal of such loans to poor borrowers.

The examiner may find that some office personnel are circumventing these controls, for example, by advancing 11 percent new money to the borrower. If found, such circumvention raises serious questions regarding portfolio quality, the adequacy of internal controls, and the effectiveness of the supervisory effort. A high volume of "under 10 percent" loans or evidence of circumvention of controls may warrant separate treatment in the report.

4. Review partial-payment, interest-only, and extension accounts. Significant numbers of these accounts may indicate potential problems for the loan portfolio and the office.
5. Review credit-extension and loan documentation procedures, especially if the office's portfolio has a high level of losses or frequent litigation. Proper credit controls and documentation are essential for sound operations. If the office extends second mortgage financing, appraisals and lien searches should be included with the documentation.
6. Test the office's delinquency reporting. There are two methods for computing delinquencies, a contractual basis and the recency basis. On a contractual basis, principal reductions are applied to the most overdue payment under the contract and the loan is considered past due from the date of the oldest unsatisfied payment. On a recency basis, delinquency is computed from the date of last payment regardless of contract terms.

   As an example, assume a loan was granted with payments beginning the first of March. The borrower makes the first payment on time and the second payment on the first of June. On the first of April, the loan is a 30-day recency account and current contractually. On the first of May, the loan is a 60-day recency account and a 30-day contractual account. Upon receipt of payment in June, the loan is current on a recency basis and a 60-day (two-payment) contractual account. Notice the difference in computations between the banking industry and the consumer finance industry.

   The consumer finance industry has begun to institute contractual delinquency reporting standards. As these standards are developed and refined, changes in the computation of delinquent accounts may be expected.
7. Review the collection effort. The past-due accounts will be under the control of the collection manager, whose objective is to return these accounts to current status. The manager's collection efforts must begin early in the delinquency pattern if the loans are to be salvaged from charge-off. Consistent, persistent, frequent effort is expected.

The foregoing steps should provide the examiner opportunity to evaluate the company's policies, procedures, and supervisory systems.

3100.0.4.5 Additional Procedures

While field visits are a desirable aspect of the inspection procedure, the examiner may have to rely on other procedures to be satisfied with certain aspects of company operations, particularly when the company reports past-due receivables on a recency rather than a contractual basis. The additional procedures may be necessary when the examiner has other reasons to question portfolio quality or the adequacy of internal controls.

The examiner may perform an extensive review of the most recent audit of the company, including the workpapers and programs of the internal and independent auditors, when available. In this review, the examiner should be able to determine whether internal controls are adequate, and portfolio characteristics are properly reported.

3100.0.4.6 Compliance

Certain aspects of the company are subject to review for compliance with the requirements of the act and Regulation Y. These include public benefits, office activities and locations, and bulk purchases of assets.

1. Public benefits stipulated in approval orders frequently require continuing reduced interest rates or insurance charges as part of the approval to operate. It is expected that these relative public benefits continue in effect despite changes in state-mandated rates.
2. Office locations and activities are subject to approval by the Board before opening for business. The operating licenses and activities of the offices should also be reviewed for compliance with the respective approvals.
3. On occasion, a consumer finance company may make a bulk purchase of loans or other assets of another finance company. Under certain circumstances, these purchases require the prior approval of the Board (12 C.F.R. 225.132). These bulk purchases should not be confused with the bulk purchase of sales finance contracts from a retailer recently signed to a dealer agreement.

4. While most consumer finance activity relates to consumer installment loans, some companies also extend credit under the ''large loan'' provisions of the consumer lending statutes of certain states. While the limitations vary from state to state, these provisions allow loans of many times the size of normal consumer loans. A review of these large loans may indicate that there are extensions of credit to local businesses which may constitute commercial installment lending. Unless specifically approved by the System, this activity may not be permissible for the company being inspected. Review for compliance with various consumer regulations is the responsibility of the Federal Trade Commission.

3100.0.4.7 Asset Classification Policy

As previously discussed, companies use one of two different methods of delinquency computation. In general, classifications should be based on the *contractual* reporting basis whenever possible. Since much of the industry utilizes *recency* reporting, which tends to reduce classifications comparatively, the classification approach enumerated above may unduly penalize an affiliated company using the contractual basis. This is particularly true when such important measures of portfolio quality as the liquidation ratios are in line with industry averages. Therefore, formula classification may result in more severe classifications for companies using the contractual method than those reporting on a recency basis. Examiners should indicate the reporting method used when calculating classifications.

Classification information is used to evaluate the adequacy of the loss reserve. In assessing the adequacy of the loss reserves, the examiner should take into consideration the charge-off frequency, the period of delinquency which would require charge-off under company policy, and the controls regarding renewal of severely past-due accounts. A shorter charge-off cycle prevents the accumulation of poor-quality assets; in this respect, monthly charge-offs are preferable to annual charge-offs. An unlimited ''when deemed uncollectible'' charge-off policy is considered lax and inadequate. The delinquency period to required charge-offs refers to the period of time a loan is past due before it is charged to the reserve; a six-month period is understandably preferred to a nine-month or one-year period. Management should have sufficient controls in place to prevent the continued renewal of loans to avoid charge-off. Adequate controls might include special coding of such loans, with supervisory review of the renewals. Inadequate controls over these assets represent poor management practices deserving special comment.

Most subordinated debt agreements provide for an adjustment (reduction) to net worth when calculating compliance with leverage limits for any loans past due 60 days on a recency basis that exceed loss reserves. As there are some seasonal characteristics to the loan portfolio, it may be of benefit to compare the delinquency statistics on inspection date to the company's seasonal pattern as revealed in both the subordinated debt calculations and monthly past-due reports. It is possible that a currently adverse portfolio condition may be due to local economic conditions which correct themselves over a period of time. Such conditions may relate to a tourist economy, an agricultural community, or a strike at a major local employer's plant. Consumer finance companies are very sensitive to these local factors; therefore, these factors may temper the examiner's evaluation of the loss reserves.

3100.0.4.8 Ratio Analysis

In order to assess the condition of a company using ratio analysis, the examiner will have to be familiar with the company's accounting policies and systems. It will become obvious from the data used in the ratios that, under certain accounting treatments, the data can be misinterpreted. The following analysis has been structured around the *Direct Cash Lending Questionnaire,* published by the Robert Morris Associates and endorsed by the National Consumer Finance Association, in an effort to provide both a format for developing the information and a means of minimizing the possibility of misinterpretation. While some consumer companies do not prepare the questionnaire, much of the information is required for management purposes and should be available from company systems.

The analytical factors presented have been derived from two principal sources: *A Lender's Approach to a Realistic Analysis of Consumer Finance Companies* by Richard E. Edwards (Philadelphia: The Philadelphia National Bank, 1970) and the *Industry Audit Guide: Audits of Finance Companies* by the Committee on Finance Companies (New York: American Institute of

Certified Public Accountants, 1988). These sources provide basic information on certain accounting and management policies and are recommended as references for the examiner. While the Federal Reserve System stipulates no specific accounting policies, the examiner may choose to criticize those policies which result in a misleading presentation of the company's financial condition.

Each year the *Annual Statement Studies*, published by Robert Morris Associates, includes sets of consumer finance company operating ratios. This information will provide a background against which the performance of the company under inspection can be measured. Such compiled ratios should be used only as background as they represent the ''average company'' in the respective sample. Attention should be directed toward the company's trends as they compare to the industry's trends and the changes in the company that are indicated by those trends.

3100.0.4.9 Delinquency

As shown in the *Annual Statement Studies*, the delinquency rates are on a recency-of-payment basis. *While past-due statistics based on contractual payments are preferred*, companies continue to report on a recency basis. It is important to have full knowledge of the company's reporting, lending, and renewal policies in order to fully understand the implications of this data. The trends for ''interest-only'' accounts and ''partial-payment'' accounts will provide some measure of the adherence of the operating personnel to company policy regarding these loan categories.

3100.0.4.10 Liquidation

Liquidation ratios provide two types of information. First, they indicate the amount of principal cash flowing back to the company for liquidity purposes. Secondly, they indicate the amount required to pay senior debt and the period of time required to do so. Several ratios follow:

1. Average monthly cash principal collection to average net monthly outstanding.

   The higher this percentage, the more liquid the portfolio. A company following conservative policies such as requiring full payments and a contractual aging of receivables will tend to show a higher principal collection percentage and, accordingly, a higher liquidity. This ratio can be used to estimate near term collections as compared to current outstandings.

   Monthly cash collections should not include loan renewals or rebates during the period. On an industry-wide basis, there appears to be a pattern of increased loan renewals during November and December, which would be reflected in a seasonal decrease in principal cash collections. Lower than expected collections may be indications of changes in local economic patterns or of increased market effort by a competitor which has resulted in loan payoff. In any event, adverse change in the collection pattern should be reviewed for the underlying causes.
2. The ratio of unsubordinated liabilities less cash and near cash to estimated monthly principal collections results in the number of months it would take to pay senior debt.
3. The ratio of senior debt to gross receivables reflects the proportion of gross receivables which would have to be liquidated to repay senior debt. The higher the percentage, the more senior lenders are relying on the assets for protection.

3100.0.4.11 Loss Reserves

Analysis of the loss reserve for a specific entity has to include company policy regarding loan charge-offs, delinquencies, payments, and charge-off frequency. In addition, if charge-offs are made gross of deferred income, the reserve account may be slightly larger than if charge-offs were net of deferred income. Ratios used to evaluate loss reserves include—

1. Reserve for loan losses to total receivables, net of deferred income,
2. Loans charged off less recoveries to average outstandings (net or gross of deferred income, depending on policy).

   Unless the company's charge-off and delinquency policies are realistic, this ratio will not depict true losses over the periods, and
3. Recoveries to loans charged off tends to be higher in companies with conservative charge-off policies than those with liberal policies. This ratio is indicative of the effectiveness of a company's collection and follow-up policy.

3100.0.4.12 Volume

Analyzing aspects of a company's loan volume can provide the examiner with some information regarding the company's renewal and credit policies.

Lengthening of loan maturities during the current period will be reflected in the future average monthly principal collections and in the company's liquidity. While loans of longer maturity are not necessarily indicative of an adverse trend, the reasons behind a longer maturity portfolio should be analyzed. Ratios used to evaluate loan volume include:

1. *New money advanced to present borrowers to total loan volume.*

   This ratio is somewhat indicative of whether the company's renewal policy is conservative or liberal. A high percentage may indicate that a volume of new money is being advanced along with the renewal of the previous balance.

2. *Loans to present borrowers with less than 10 percent new money advanced to loan volume.*

   A high ratio can indicate the possibility of disguised delinquencies and potential charge-offs. The examiner may take a random sample of loans in the new money advanced to present borrowers category and review them to determine whether or not the company's ''balance renewal'' policy is being followed.

The preceding ratios were presented because they represent a means of measuring the effect of certain company policies. The analysis of company operations may be expanded to include other ratios such as return on equity, return on assets, interest margins, and other conventional measurements. The particular format utilized will, of course, vary to some degree between companies, however, the analysis should be broad enough in scope to determine the company's trends and the causes of those trends.

3100.0.4.13 Evaluation of the Company's Condition

Ratio analysis of a consumer finance company is a feasible technique for evaluating its condition because of the ''portfolio effect'' of its assets. However, the examiner must look beyond the ratios and analyze the effects of company policies on the elements of the ratios. As an example, if a company only charges off loans once a year, the losses determined by a formula classification would be less just after the charge-off date than just before.

In comparing classifications from one inspection to another, there might be a difference in the loss classifications which may be interpreted as an apparent improvement or decline in asset quality should the inspections bracket the charge-off date. Similar misinterpretations can occur from a change in charge-off frequency, a change to an automatic charge-off policy, or a shortening in the past-due period required for charge-off.

Certain accounting and reporting techniques may also be misleading in ratio analysis. For example, an artificial improvement in earnings would be reported when a company changes from a collection basis to an accrual basis of income recognition, if the collection and follow-up policy had been poor or deteriorating. Only a thorough review of the accounting policies and an understanding of their interplay with operating policies will prevent this type of misinterpretation. In some cases, the company's accounting system may yield results that inadvertently distort the ratios. A company recognizing income on a straight-line basis would, during a period of low loan volume, reflect improving gross interest income as a percentage of loans outstanding. While the importance of realistic accounting policies cannot be overstated, neither can the proper interpretation of reported results be overstressed.

One of the key elements in the evaluation of the company's performance is reflected in the ratios, but not quantified by the analysis. The company's internal controls and management information systems are the primary means of controlling asset quality and communicating management's policies. The supervisory effort is not only reflected by the ratios, but also in such areas as personnel turnover, citations in state supervisory reports, audit exceptions, and litigation. The systems relied on by management should be responsive not only to the changing needs of the company, but also to the changing climate of consumer regulations.

In the inspection report commentary, the examiner should maintain an objective view of the company under inspection. Management's corrective actions for exceptions and plans to reverse adverse trends are a necessary ingredient in the commentary. Report comments should give the reader an accurate picture of the condition of the company and its relationship with, and impact on, the financial condition of the consolidated corporation and the subsidiary bank(s).

3100.0.5 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

The Board amended Regulation Y, effective April 21, 1997, to include the acquiring of debt in default as an authorized nonbanking activity for bank holding companies (see Regulation Y, section 225.28(b)(2)(vii)). A bank holding may acquire debt that is in default at the time of acquisition if the company—

1. divests shares or assets securing debt in default that are not permissible investments for bank holding companies, within the time period required for divestiture of property acquired in satisfaction of a debt previously contracted under section 225.12(b) of Regulation Y;
2. stands only in the position of a creditor and does not purchase equity of obligors of debt in default (other than equity that may be collateral for such debt); and
3. does not acquire debt in default secured by shares of a bank or bank holding company.

The Board held that these restrictions were necessary to define the scope of the activity and to ensure that the activity remains the acquisition of debt instead of an impermissible nonbanking activity involving the acquisition of securities or other assets. As for calculating the time period for disposing of the underlying shares or assets, the time period is the same as that applied under the BHC Act to disposing of shares or assets acquired in satisfaction of a debt previously contracted. During this period, a bank holding company can divest the property or, in the case of any debt that has been previously contracted, restructure the debt.

The initial Board order that was issued to permit the acquisition of defaulted debt is summarized here as a historical example of the nonbanking activity. Provisions or commitments made in the Board order should not be relied upon. The current requirements are found in section 225.28(b)(2)(vii) of Regulation Y.

3104.0.1 ACQUISITION OF DEFAULTED DEBT—BOARD ORDER

A bank holding company (the applicant) within the meaning of the BHC Act gave notice under section 4(c)(8) of the BHC Act (12 U.S.C. 1843(c)(8)) and the Board's Regulation Y that it proposed to acquire a company (the company) and engage nationwide in asset-based commercial lending and management of assets.

The applicant proposed to engage through the company in managing certain assets as the corporate general partner in two limited partnerships (the partnerships).[1] The applicant committed to conduct the activities, which the Board previously determined to be permissible, through the partnerships, subject to the limitations previously established by the Board.[2]

One nonbanking activity proposed by the partnerships, acquisition of defaulted debt, was an activity that the Board had not previously approved. The partnerships are engaged primarily in making, servicing, and investing in discounted bank loans and other debt securities.[3] The partnerships acquire debt that has been or is in the process of being restructured, including secured and unsecured debt in the form of bank loans, privately placed and publicly traded debt instruments, bonds, notes, debentures, and discounted receivables.[4] The applicant stated that the partnerships will take an active role in the restructuring of the defaulted debt they acquire, including participating on creditors' committees. The applicant indicates that such discounted debt would be acquired for the purpose of restructuring the debt to achieve a higher yield and greater collateral protection.

Some of the debt the partnerships would acquire may be in default at the time of acquisition and may be secured by voting shares or

1. The first partnership group (in which the company owned more than a 50 percent interest) was to terminate by December 31, 1995. The company owned less than 50 percent of the second partnership group, which would terminate by December 31, 1999.

2. See 1994 FRB 736. The partnerships, together with the applicant and its affiliates, would hold not more than 5 percent of any class of voting securities of any issuer and not more than 25 percent of the total equity, including subordinated debt, of any issuer. In addition, the applicant committed that no directors, officers, or employees of the applicant or its affiliates will serve as directors, officers, or employees of any issuer of which the applicant and its affiliates hold more than 10 percent of the total equity. The applicant also committed that future limited partnerships would be structured in the same manner as the current partnerships.

3. The partnerships are not leveraged, and the applicant stated that the partnerships will not be leveraged. The applicant has committed that neither the applicant nor any of its subsidiaries would be permitted to make loans to the partnerships.

4. The debt investments may include investments in companies that may be contemplating, be involved in, or recently have completed a negotiated restructuring of their outstanding debt or a reorganization under chapter 11 of the Federal Bankruptcy Code.

other assets that would be impermissible for a bank holding company to hold without Board approval.[5] Because the partnerships would have the right in some cases to take title immediately to shares or assets securing defaulted debt that they acquire, the applicant committed that the partnerships would treat this collateral, as well as any other assets acquired in renegotiating this debt, as assets acquired in satisfaction of a debt previously contracted (DPC). Under the BHC Act, a bank holding company must divest any shares or assets acquired as DPC within two years from the date the asset is acquired. For this purpose, the applicant has committed that it will consider shares or assets acquired in satisfaction of defaulted debt to have been acquired on the date the defaulted debt is acquired.[6]

The Board stated that the acquisition of defaulted debt under the circumstances and conditions proposed by the applicant is an activity that is closely related to banking. The applicant stated that it will only purchase debt, not equity, and will stand in the position of a creditor.

Based on all the facts of record, the Board concluded that the proposed activities are closely related to banking. The Board approved the notice on October 17, 1995 (see 1995 FRB 1128). Approval was specifically conditioned on the applicant's compliance with the commitments made in connection with the notice.

5. The applicant has committed that the partnerships will not acquire debt in default that is secured by shares of banks or bank holding companies.

6. The applicant could apply for up to a three-year extension. See 12 C.F.R. 225.22(d)(1). The Board notes that the divestiture requirement would be satisfied if, during the divestiture period, the partnerships renegotiate the debt into a performing obligation and release the collateral to the borrower as part of the renegotiation. To the extent that defaulted debt acquired by the partnerships is secured by assets or shares that would be permissible investments for a bank holding company, this divestiture commitment would not apply.

Section 4(c)(8) of the BHC Act (Credit Card Authorization and Lost/Stolen Credit Card Reporting Services) Section 3105.0

A bank holding company applied for the Board's approval, pursuant to section 4(c)(8) of the BHC Act, to engage de novo, through its existing nonbank subsidiary, in credit card authorization services and lost/stolen credit card reporting services. The credit card authorization activity would consist of providing, for a fee, a service to issuers of credit cards that would enable merchants to determine the validity and credit limits of cards tendered to them. In addition, the applicant was to provide, for a fee, a reporting service to credit card holders, that would enable them to report the loss or theft of any of their credit cards via a single toll-free telephone call to the nonbank subsidiary.

A number of banks indirectly offer the service of reporting lost cards that are issued by other institutions by arranging with independent companies to provide the service under a trade name associated with the bank. With respect to credit card authorization services, banks have a financial interest in the security of the credit cards and the availability of credit. Based on the foregoing, the Board believed that banks generally have, in fact, provided the services proposed by the applicant and are particularly well suited to provide the proposed services. On that basis, the Board concluded that the proposed services were closely related to banking.

Since the proposed credit card reporting service would create more competition and provide greater conveniences by allowing an individual who loses more than one card to report all lost cards at once to one source rather than having to make separate notifications to each card issuer, and there was no evidence of adverse effects as a result of the proposal, the application was approved by the Board on January 5, 1985 (1985 FRB 648). See Regulation Y, section 225.28(b)(2).

A domestic bank holding company (the applicant) applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.23(a)(3) of the Board's Regulation Y to engage de novo, through a wholly owned subsidiary, in the following services to customers who make loans secured by inventory:

1. identifying inventory and deciding its general condition, level of protection, and amount of use, as appropriate
2. identifying inventory subject to a purchase-money security interest under the Uniform Commercial Code
3. identifying missing inventory and any credit exposure that could result
4. supporting the proper allocation of loan payments that are related to the aging or sale of inventory[1]

The applicant would provide the above inventory-inspection services only in connection with an extension of credit either by the BHC (applicant) or a third pary. The service would be provided throughout the United States, but only in connection with inventory pledged as collateral for a loan.

Bank holding companies currently inspect and survey collateral for loans made or services provided by them. Banks inspect collateral for loans originated in direct lending activities. The applicant suggested that its proposed collateral-inspection services to third-party lenders are identical to the collateral-inspection services performed for its own extensions of credit.

In accordance with section 225.28(b)(1) of Regulation Y, the Board authorized bank holding companies to make, acquire, and service loans for the company's own account or for the account of others. The Board believes that these activities include collateral-inspection services provided to third parties in connection with third-party extensions of credit. The Board also believes that bank holding companies have the necessary expertise to provide this service for other lenders (on a stand-alone basis).

The Board found that public benefits would result from a potential increase in the availability of inventory financing. It noted that there was no evidence suggesting that the proposal would result in significant adverse effects. The financial and managerial resources of the applicant were believed to be consistent with previous approvals. The Board, based on the facts of record, and the commitments and conditions made by the applicant, approved the request on September 13, 1993 (1993 FRB 1053).

1. For example, a loan may be secured by a pool of inventory collateral, but there may be an agreement to apply loan proceeds to specific items of collateral in a specified order. Equipment used beyond a stated number of hours might be of limited value, and the lender might agree to release its security interest in such items. The inspection of inventory collateral would verify the equipment's proceeds to pay off the oldest (or the youngest) items of collateral first (or last), rather than applying the proceeds pro rata to all items.

A bank holding company may acquire or retain an industrial bank to the extent authorized by state law, under section 225.28(b)(4) of Regulation Y only if the industrial bank acquired by the holding company is not a ‘‘bank’’ within the meaning of the Bank Holding Company Act. Industrial loan companies, industrial banks, and Morris Plan banks are state-chartered financial institutions which engage primarily in the business of furnishing consumer loans and small-business loans. The distinction between these institutional forms and consumer finance companies lies in the ability to generate funds through the acceptance of deposits or issuance of certificates of indebtedness (thrift notes). Although some of these institutions have the same charters as banks (in some states), they traditionally have not been considered to be banks for purposes of the Bank Holding Company Act as they cannot both make commercial loans and accept demand deposits, although in some states they have been empowered to offer NOW accounts. Under a decision of the Supreme Court, NOW accounts are not demand deposits for the purposes of defining what a bank is. Thus, industrial loan companies and similar institutions may offer NOW accounts and make commercial loans without being treated as banks for purposes of the Bank Holding Company Act. These institutions may be insured by the Federal Deposit Insurance Corporation and are eligible for membership in the Federal Reserve System. Many of the companies are ‘‘self-insured’’ (by a consortium of similar institutions in the form of a guaranty corporation) or are uninsured.

3110.0.1 NONBANKING ACQUISITIONS NOT REQUIRING PRIOR BOARD APPROVAL

In accordance with 12 C.F.R. 225.22(d)(8) of Regulation Y, the Board’s prior approval is not required for certain asset acquisitions by a lending company or industrial bank. This refers to the assets of an office(s) of a company of which all, or substantially all, the assets relate to making, acquiring, or servicing loans for personal, family, or household purposes, if—

- the acquiring company has previously received Board approval to engage in lending or industrial banking activities under Regulation Y;
- the assets acquired during any 12-month period do not represent more than 50 percent of the risk-weighted assets (on a consolidated basis) of the acquiring lending company or industrial bank, or more than $100 million, whichever amount is less;
- the assets acquired do not represent more than 50 percent of the selling company’s consolidated assets that are devoted to lending activities or industrial banking business;
- the acquiring company notifies the Reserve Bank of the acquisition within 30 days after the acquisition; and
- the acquiring company, after giving effect to the transaction, meets the Board’s capital adequacy guidelines and the Board has not previously notified the acquiring company that it may not acquire the assets under the exemption.

3110.0.2 INSPECTION OBJECTIVES

1. To determine the quality of the loan portfolio and the overall condition of the company.
2. To determine what exposure the subsidiary presents to the holding company and subsidiary bank(s).
3. To determine compliance with applicable laws and regulations.

3110.0.3 INSPECTION PROCEDURES

1. Contact the applicable state regulatory agency to determine the legal parameters within which the company operates and to assess the degree to which the company is supervised. Each of the institutional structures under this exemption is state chartered, and the laws and regulations vary widely from state to state. The company may be directly supervised by its state department of banking or may be subject to virtually no supervision or regulation. If the company is insured by the Federal Deposit Insurance Corporation or is a member of the Federal Reserve System, the company is primarily subject to the primary supervision and regulation of that agency. In cases in which the company is supervised by a banking agency, that agency’s report of examination will generally suffice. However, when the company is not supervised or examined, or when the Reserve Bank finds the supervis-

ing agency's report inadequate, an on-site inspection is necessary.

2. Focus on an evaluation of the loan portfolio and securities account, a determination of the volatility of the deposits, an appraisal of the adequacy of the audit program, and a review of the company's internal policies.
3. Review the receivables representing lending activities. The company should provide a schedule of the aging of the consumer receivables. It is preferable that the aging be done on a contractual method. Classification of the consumer paper may be done on a formula basis. The larger credits must be given a complete evaluation.
4. Review the adequacy of the allowance for loan and lease losses in conjunction with the asset evaluation.
5. Price the securities portfolio, with particular emphasis placed upon determining its liquidity. Since the deposits of these institutions are not always insured, they are more susceptible to a deposit run off; therefore, the requirement of adequate liquidity is of paramount importance.

   The deposits may be insured by a guaranty corporation up to a certain limit in some states. These guaranty corporations have provided some stability to the industry. The guaranty corporations are independent of any government agency or municipality and therefore are limited in the amount of protection which can be offered depositors.
6. Review back-up lines of credit available to ensure secondary liquidity to the company.
7. Review the deposit accounts of the company. The deposits are evidenced by certificates of indebtedness, or thrift notes. Information regarding the number of deposits, the size of accounts, and maturity distribution should be obtained to assess the stability of the funding base.
8. Determine that the institution makes proper disclosure to the public as to the type of instrument the certificate represents. Some states require that a disclosure statement, or a prospectus, be filed with the public yearly, which sets forth the uses to which the funds are being put and states that the funds are not insured. This prospectus should be reviewed for proper disclosure of the required information to ensure against possible suits.
9. Check the company's policy concerning withdrawals, giving recognition to state law requirements, to ascertain whether funds are generally not allowed to be withdrawn without prior notice.
10. Review the scope of the internal or external audits.

2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Before 1989, the Board had determined that the operation of a savings association is closely related to banking but concluded, as a general matter, that the operation of a savings and loan association is not a proper incident to banking because the potential adverse affects of generally allowing the affiliations of banks and thrift institutions were not outweighed by the potential public benefits (1977 FRB 280). In other individual cases, the Board found that the adverse effects of the affiliation would be outweighed by the public benefits of preserving the failing thrift institution as a competitor in its market and ensuring public confidence (see 1985 FRB 462). The 1982 Garn–St Germain Act recognized the Board's authority under section 4(c)(8) of the BHC Act to approve such acquisitions by authorizing the Board to dispense with the usual notice and hearing requirements of this section under appropriate emergency circumstances.

Provisions of the Financial Institutions Reform, Recovery and Enforcement Act of 1989 (FIRREA) amended section 4 of the Bank Holding Company Act to give bank holding companies the authority, effective August 9, 1989, to acquire any savings association. The legislation lifted the previously existing ‘‘tandem operations’’ restrictions as they apply to savings associations that are owned by bank holding companies (see 1989 FRB 716, appendix I). These restrictions provided that savings associations acquired by a bank holding company could not be operated in tandem with any other subsidiary of the bank holding company, and required approval by the appropriate Federal Reserve Bank before the savings association engaged in any transactions with the bank holding company or its other subsidiaries. The Board is now prohibited from imposing such restrictions on such transactions in the future, except for those required by sections 23A and 23B of the Federal Reserve Act. With respect to previous Board approvals of the acquisition of problem thrifts by BHCs, FIRREA required the Board to modify those approvals by limiting any restrictions on transactions between the savings association and its holding company affiliates to those required under sections 23A and 23B of the Federal Reserve Act. In 1989 FRB 716, the Board removed the tandem restrictions imposed on the operations of savings association subsidiaries of a bank holding company.

The Board amended Regulation Y pursuant to FIRREA, effective October 10, 1989 (see 12 C.F.R. 225.28(b)(4)(ii)). The regulation allows bank holding companies to acquire healthy as well as failed or failing savings and loan associations in accordance with FIRREA. The regulation permits bank holding companies to acquire savings and loan associations in any state, regardless of whether the holding company may operate a bank in that state. It does not impose any operational or branching conditions on the operations of savings and loan associations. The regulation authorizes, as a permissible activity under section 4(c)(8) of the BHC Act, the owning, controlling, or operating of a savings association, if the savings association engages only in deposit taking, lending, and other activities that are permissible for BHCs.[1] The Board has permitted a short divestiture period for impermissible investments and other activities (see 1992 FRB 707).

FIRREA established a five-year moratorium on any aquisition that involved the transfer of deposits from one federally insured deposit fund to another, with limited exceptions. As a general matter, the moratorium prevented an institution whose deposits are insured by the Savings Association Insurance Fund (SAIF) from converting to an institution whose deposits are insured by the Bank Insurance Fund (BIF). A provision of FIRREA provided that this moratorium does not apply to the merger of a SAIF-insured savings association owned by a bank holding company into a BIF-insured bank subsidiary of the same holding company. This provision, known as the Oakar Amendment,[2] authorized bank holding companies to merge troubled savings associations into bank subsidiaries during the moratorium period, as well as avoid the payment of

1. Section 225.2(m) of Regulation Y defines a savings association as (a) any federal savings association or federal savings bank; (b) any building and loan association, savings and loan association, homestead association, or cooperative bank if such association or cooperative bank is a member of the Savings Association Insurance Fund (SAIF); and (c) any savings bank or cooperative which is deemed by the director of the Office of Thrift Supervision to be a savings association under section 10(l) of the Home Owners' Loan Act.

2. The Federal Deposit Insurance Corporation Act of 1991 amended the Oakar provision (commonly referred to as ‘‘Oakar II Amendment’’) to authorize a bank that is not a subsidiary of a bank holding company to merge directly with a thrift. The Riegle Community Development and Regulatory Improvement Act further amended the Oakar provisions to eliminate the requirement for prior Federal Reserve Board approval of Oakar transactions when the bank involved (in an acquisition of a thrift) is a BIF member subsidiary bank of a bank holding company.

exit and entrance fees to the deposit insurance funds required under FIRREA for other savings association conversion transactions.

One provision that has a significant bearing on BHCs is a FIRREA provision (12 U.S.C. 1815(e)) addressing the liability of commonly controlled institutions. Any insured depository institution is liable for any loss incurred by the FDIC in connection with a commonly controlled insured depository institution in default or in danger of default. (See section 2090.8 for a discussion of this provision as well as section 2020.1 with regard to the sister-bank exemption from section 23B of the Federal Reserve Act.)

2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

The performance of trust services by a trust company subsidiary that is neither a ‘‘bank’’ nor a nonbank bank encompasses virtually any kind of fiduciary, agency, or custodial service commonly performed by a trust company so long as the subsidiary does not accept demand deposits or make loans, except as expressly permitted by section 225.28(b)(5) of Regulation Y. Generally, under Regulation Y, a trust company may only accept deposits arising out of trust funds not currently invested; perform escrow services, such as receiving, holding, and disbursing downpayments and other funds deposited by purchasers in real estate transactions; and act as an agent for an issuer of, or broker or dealer in, securities in a capacity of a paying agent, dividend-disbursing agent, or securities clearing agent, so long as the funds are not used by the customer as a general-purpose checking account and do not bear interest. The subsidiary's lending activities are restricted to making call loans to securities dealers and to purchasing money market instruments; however, such loans may not be used to provide funding for nonbank subsidiaries of the holding company.

Trust companies may be either state chartered or nationally chartered. Some nationally chartered trust companies have national bank charters but have agreed through limitations in their bylaws to engage only in those activities permitted for trust departments of national banks. To prevent the use of a trust company as a vehicle for evasion of section 3(d) of the Bank Holding Company Act, the Board has conditioned its approval of certain interstate acquisitions by requiring that (1) the trust company's demand deposit–taking activities not be operated in tandem with any other subsidiary, (2) demand deposit and commercial lending services of affiliates will not be linked in any way, and (3) the trust company will not engage in any transactions with affiliates, other than the payment of dividends or the infusion of capital, without the Board's approval (for example, see U.S. Trust Corporation, 1984 FRB 371). The scope of these conditions may be reviewed by the Board in connection with nonbank bank applications.

As part of normal administration of its trust accounts, a trust company will from time to time engage in an activity, such as property management or land development, that has been determined to be *not* closely related to banking by the Board. Any such service may only be performed incidentally to fiduciary-account administration and may not be offered or marketed as a separate service.

The board of directors and senior management of financial holding companies (FHCs) and bank holding companies (BHCs) are responsible for overseeing the operations of their fiduciary activities in a safe and sound manner. Such oversight (particularly for those BHCs and FHCs engaged in a broad range of financial activities) at the consolidated level is important because the risks associated with financial activities as well as fiduciary activities can cut across legal entities and business lines. Federal Reserve examiners review and assess the internal policies, reports, and procedures and effectiveness of the BHC/FHC consolidated risk-management process.

The appropriate regulator of trust activities (including activities of a fiduciary, agency, or custodial nature) has the primary responsibility for evaluating risks, hedging, and risk management at the legal-entity level for any subsidiary or subsidiaries that the regulator supervises. Federal Reserve examiners should seek to use the examination findings of the appropriate regulators. (See SR-00-13.)

To determine the complete scope of fiduciary assets within an FHC/BHC, examiners should reference the Uniform Bank Performance Report (UBPR), which reflects the information gathered on Schedule RC-T. To further understand the scope of fiduciary assets within an FHC/BHC, an examiner should also look at information reported on Schedules Y-11 and Y-9C with respect to income derived from trust, fiduciary, and asset-management activities. (See also page 4 of the Bank Holding Company Performance Report (BHCPR) for the amount and percentages of income from fiduciary activities to adjusted operating income (tax-equivalent), including the BHC's corresponding peer-group ratios.)

Peer analysis is also available at the bank level. Examiners should refer to pages Trust 1 and Trust 1A of the UBPR. General comparison information is also available on a lagged basis in the FFIEC's electronic report ‘‘Trust Assets of Financial Institutions’’ (www2.fdic.gov/structur/trust/index.asp). Aggregate data are listed by year back to 1996.

3120.0.1 ON-SITE INSPECTIONS

Trust companies are normally engaged in activities such as management of funds for individuals. These activities are significant to the integrity of the banking system and involve significant potential liability to the bank holding company if not properly conducted. Therefore, periodic on-site inspections should be performed. If the trust company is examined by a state banking department, then alternate-year examination procedures may apply. If nationally chartered, a review of the periodic on-site examinations of the Comptroller of the Currency will generally suffice. If the trust company is not subject to a regular examination by another federal banking agency (i.e., if it is an uninsured, state-chartered nonmember trust company), the Reserve Bank should perform regular on-site inspections to include, at a minimum, full-scope reviews of the trust activity. The inspections would use procedures such as those used in the examinations of trust activities of state member banks. This portion of the inspection should be performed by examiners specially trained in trust examinations. Holding company inspectors should specifically review trust activities for compliance with any conditions imposed by the Board in connection with the approval of an application.

The main sections that follow (sections 3130.1 through 3130.9) address all financial and investment advisory activities under section 4(c)(8) of the BHC Act and section 225.28(b)(6) of Regulation Y that have been authorized by the Board. This section provides general inspection objectives and procedures that relate to such financial and investment advisory activities. These objectives and procedures can be applied to the BHC inspection of every advisory activity when advisory activities are not listed separately in any of this manual's individual advisory sections.

Any commitments that were made by the bank holding company or its nonbank subsidiaries to the Federal Reserve System pertaining to its financial and investment advisory nonbanking activities should be reviewed by the examiner for compliance and applicability, in accordance with the current statutory and regulatory provisions. Any existing commitments or conditions that relate to the financial resources of a bank holding company or its subsidiaries or to commitments or conditions that relate to the risk-management policies of the organization should remain intact and should be reviewed by an examiner for compliance during each inspection.

The Board's Regulation Y, effective April 1997, resulted in a structural reorganization of financial and investment advisory nonbanking activities. The provision of discretionary investment advice is no longer limited to institutional customers. Bank holding companies and their subsidiaries may engage in financial and investment advisory activities without restriction. Bank holding companies can manage retail customer accounts outside of the trust department of an affiliated bank (to the extent permitted by law). Further, bank holding companies may engage in any combination of permissible nonbanking activities listed in Regulation Y. Accordingly, bank holding companies may provide financial and investment advice jointly with permissible agency transactional service, investment or trading transactions as principal, or any other listed nonbanking activity.

The rules in Regulation Y provide examples of financial and investment advisory activities that are illustrative rather than exclusive. With regard to the examples, a bank holding company may act as an investment or financial adviser without restriction to any person, including

1. serving as an investment adviser (as defined in section 2(a)(20) of the Investment Company Act of 1940) to an investment company registered under that act, including sponsoring, organizing, and managing a closed-end investment company;
2. furnishing general economic information and advice, general economical statistical forecasting services, and industry studies;
3. providing advice in connection with mergers, acquisitions, divestitures, investments, joint ventures, leveraged buyouts, recapitalizations, capital structurings, financing transactions and similar instruments, and conducting financial-feasibility studies;
4. providing information, statistical forecasting, and advice with respect to any transaction in foreign exchange, swaps, and similar transactions, commodities, and any forward contract, option, future, option on a future, and similar instrument;
5. providing educational courses and instructional materials to consumers on individual financial-management matters; and
6. providing tax-planning and tax-preparation services to any person.

Sections 3130.1 through 3130.9 include many historical examples of various financial and investment advisory activities that have been approved by the Board. These examples are to be viewed as historical references. They should be considered as to their applicability to current statutory and regulatory provisions. Some examples include, but are not limited to, providing financial advice in rendering fairness opinions and providing valuation services in connection with mergers, acquisitions, divestitures, investments, joint ventures, leveraged buyouts, recapitalizations, and capital structurings. Other examples include providing advice on financing and similar transactions with respect to private and public financings and loan syndications; conducting financial-feasibility studies; and providing financial advice to state and local governments with respect to the issuance of their securities.

3130.0.1 INSPECTION OBJECTIVES

1. To review the adviser's organizational structure and the qualifications of its management to conduct business, and to determine whether they are satisfactory.

2. To determine the status of the adviser's financial condition and the adequacy of internal controls, general accounting policies, and reporting procedures, and to determine if they reflect the guidelines established by management.
3. To determine whether fee income is accurately computed and reported on a consistent basis.
4. To determine what financial effect the activity has on the parent holding company and the bank subsidiaries.
5. To review and evaluate investment practices considering the adviser's investment responsibilities for the selection and allocation of investments for various types of accounts to determine whether they are appropriate.
6. To evaluate funding sources, including indebtedness, and their management with respect to maturities and interest rates.
7. To determine the adequacy of internal and external audits.
8. To determine whether the adviser company has adequate policies and procedures to prevent self-dealing and similar improper conflicts.
9. To determine whether operating practices provide for adequate legal documents and agreements such that the account activities, in general, are consistent with the contractual responsibilities and authorities.
10. To determine if any litigation is pending against the company and the possible impact of an unfavorable court decision.
11. To evaluate compliance with applicable bank holding company laws, regulations, and interpretations, including compliance with the standards of care and conduct applicable to fiduciaries as required by Regulation Y.

3130.0.2 INSPECTION PROCEDURES

1. Review System approval and activities for conformance with any limitations. Determine if the activity is conducted through a separately incorporated subsidiary of the bank holding company that—
   a. refrains from taking positions for its own account;
   b. observes the standards of care and conduct applicable to fiduciaries with respect to its advisory and transactional services; and
   c. avoids executing customer transactions when acting in an advisory capacity.
2. Prepare financial statements for the last two fiscal years, plus interim if appropriate. Analyze for adverse trends and evaluate for negative effects on affiliates.
3. Evaluate asset quality when warranted, documenting the scope and detailing asset review. Compile classification data, write up classifications if appropriate, and evaluate reserve adequacy.
4. Obtain documentation for all indebtedness. Evaluate funding sources for maturity mismatch, dependence on affiliates' concentrations, and dependability. Review borrowings from affiliate banks for compliance with section 23A of the Federal Reserve Act.
5. Review income and expense accounts and transactions with affiliates for compliance with section 23B of the Federal Reserve Act.
6. Review the company's revenue sources to determine that it has not taken positions and does not, itself, execute transactions when acting in an advisory capacity.
7. Evaluate contracts and service agreements with affiliates. Identify whether the company receives or provides services or products. Determine that the services or products are needed and received or provided, and that the contract or agreement terms represent market rates.
8. Review the company's fee schedule for providing advice and the fees charged by affiliated banks to conduct transactions for the company's customers. Determine whether the bank is being adequately compensated for executing trades, or whether these profits are accruing largely to the benefit of the company.
9. Review checking-account statements for all accounts at affiliate banks for overdrafts since the previous inspection.
10. Evaluate whether the nonbank activities are being performed by affiliate bank personnel or are using bank assets. If so, is the bank adequately compensated?
11. Identify off-balance-sheet activities and contingent liabilities, and assess the risk to the company and any affiliate.
12. Obtain a listing of litigation against the company or any individuals who represent the company from the company's legal counsel, and evaluate potential effects on the financial condition.
13. Obtain and review internal and external audit reports and workpapers.

14. Obtain and review internal and external asset-review reports.
15. Obtain and review copies of the board of directors' and senior management's policies and procedures.
16. Review a sample of recommendations to determine that a reasonable basis exists for the company's recommendations.
17. Review the advisory contracts to determine if there are any conflicts of interests involving the parent company or affiliates, as well as the officers, directors, or principal shareholders and their related interests of the holding company and its affiliates.
18. Evaluate insurance for adequacy.
19. Obtain or verify that workpapers contain the following permanent documentation:
    a. System approval letters
    b. date of incorporation or date acquired
    c. date activity commenced
    d. articles of incorporation and by-laws
    e. commitments
    f. supervisory actions
    g. other pertinent correspondence
20. Obtain and review a listing of shareholders for each class of stock outstanding, and a schedule of officers, directors, and their related interests.

A bank holding company or its nonbank subsidiary that engages in investment or financial adviser activities is subject to section 225.28(b)(6) of Regulation Y. The purpose of an inspection of a company providing investment or financial advice is to determine that it is operating according to applicable laws, regulations, and interpretations, and to determine that the company is subject to an adequate audit program. Regulation Y allows a bank holding company to serve as an investment adviser as defined in section 2(a)(20) of the Investment Company Act of 1940 (15 U.S.C. 80a-2(a)(20)), which defines an ‘‘investment adviser’’ of an investment company as ‘‘…any person who pursuant to contract with such company regularly furnishes advice to such company with respect to the desirability of investing in, purchasing or selling securities or other property, or is empowered to determine what securities or other property shall be purchased or sold by such company…’’

The Board has issued an interpretive rule regarding the investment adviser activities of bank holding companies under Regulation Y (12 C.F.R. 225.125). The following is a list of some of its provisions:

1. Bank holding companies, including their bank and nonbank subsidiaries, may act as investment advisers to various types of investment companies such as mutual funds and closed-end investment companies. Mutual funds and closed-end investment companies are described in the interpretation.
2. Bank holding company investment adviser activities are limited by the Glass-Steagall Act (Banking Act of 1933 (12 U.S.C. 24, 78, 377, 378)). This act generally prohibits member banks from engaging in the purchase or sale of equity securities other than in an agency capacity.
3. A bank holding company may not sponsor, organize, or control a mutual fund. This does not apply to closed-end investment companies so long as they are not primarily or frequently engaged in the issuance, sale, or distribution of securities.
4. A bank holding company should not act as investment adviser to an investment company which has a name similar to the bank holding company or any of its subsidiary banks, unless the prospectus of the investment company contains certain required disclosures. In no case should a bank holding company act as investment adviser to an investment company that has either the same name as the name of the bank holding company or any of its subsidiary banks, or that has a name that contains the word ‘‘bank.’’
5. Since investment adviser activities may create potential conflicts of interest, the Board determined that a bank holding company and its subsidiaries should not purchase in their sole discretion, in a fiduciary capacity (including as managing agent), securities of any investment company for which the bank holding company acts as investment adviser, unless the purchase is specifically authorized by (1) the terms of the instrument creating the fiduciary relationship, (2) court order, or (3) the law of the jurisdiction under which the trust is administered.
6. A bank holding company may not engage, directly or indirectly, in the underwriting, public sale, or distribution of securities of any investment company for which it or any nonbank subsidiary acts as investment adviser, except in compliance with section 20 of the Glass-Steagall Act. The Board has determined, however, that the conduct of securities brokerage activities by a bank holding company or its nonbank subsidiaries, when conducted individually or in combination with investment advisory activities, is not deemed to be the underwriting, public sale, or distribution of securities prohibited by the Glass-Steagall Act.
7. A bank holding company or any of its nonbank subsidiaries that have been authorized by the Board under the Bank Holding Company Act to conduct securities brokerage activities (either separately or in combination with investment advisory activities) may act as agent, upon the order and for the account of customers of the holding company or its nonbank subsidiary, to purchase or sell shares of an investment company for which the bank holding company or its subsidiaries act as an investment adviser.
8. A bank holding company or any of its nonbank subsidiaries that have been authorized by the Board under the Bank Holding Company Act to provide investment advice to third parties generally (either separately or in combination with securities brokerage services) may provide investment advice to customers with respect to the purchase or sale of shares of an investment company for

which the holding company or any of its subsidiaries acts as an investment adviser.

9. A bank holding company or its subsidiary bank, at the time a service is provided, must caution customers to read the prospectus of the investment company before investing. Customers must be advised in writing that the investment company's shares are not insured by the Federal Deposit Insurance Corporation and are not deposits, obligations, or endorsed or guaranteed in any way by any bank (unless that is the case). The role of the company or affiliate as adviser to the investment company must be disclosed in writing. Such disclosures may be done orally, but the cusotomer must be given such disclosures in writing immediately thereafter.
10. Because of potential conflicts of interest, a bank holding company which acts both as custodian (pursuant to section 225.25(b)(3) of Regulation Y) and investment adviser for an investment company should exercise care to maintain at a minimum level demand deposit accounts of the investment company which are placed with a bank affiliate, and should not invest cash funds of the investment company in time deposit accounts (including certificates of deposit) of any bank affiliate.

3130.1.1 REAL ESTATE DEVELOPMENT ADVISERS FOR STATE AND LOCAL GOVERNMENTS

Advising state and local governments about methods available to finance real estate development projects, and evaluating projected income to determine if debt resulting from proposed development projects can be adequately serviced is permissible if the activities are authorized under section 225.28(b)(6) of Regulation Y.

Before this activity was incorporated into Regulation Y, in 1980, the Board had received certain comments noting that certain aspects of these advisory services may be within the scope of the activity of ‘‘management consulting.’’ The Board had found that it was not permissible for bank holding companies to offer management consulting services to nonaffiliated companies. Certain management consulting advice could be provided to unaffiliated depository institutions, however. In view of the relationship that had traditionally existed between banks and state and local governments, and the net public benefits that would result from provision of advice to such governments by bank holding companies, the Board indicated that it would be more flexible in determining what particular services constitute ‘‘providing financial advice’’ rather than ‘‘management consulting’’ when the services are solely for state and local governments rather than other nonbank organizations. With the Board's April 1997 revision of Regulation Y, investment and financial advisory activities were grouped together and a bank holding company could act as an investment or financial adviser without restriction.

The Board also allowed the provision of management consulting services regarding any financial, economic, accounting, or audit matter to any company. These financial activities are directly related to the activities and expertise of bank holding companies. Management consulting services are subject to a revenue limitation, however. They may be provided to any customer on any matter, provided that the total annual revenue derived from the management consulting services does not exceed 30 percent of the company's total annual revenue derived from management consulting activities. Thus, any services provided to state and local governments that are deemed management consulting services are subject to this revenue limitation.

3130.1.2 INSPECTION OBJECTIVES

1. To review the adviser's organizational structure and the qualifications of management to conduct business, and to determine whether they are satisfactory.
2. To determine the status of the adviser's financial condition and the adequacy of internal controls, general accounting policies, and reporting procedures, and to determine if they reflect the guidelines established by management.
3. To determine whether fee income is accurately computed and reported on a consistent basis.
4. To determine what financial effect the activity has on the parent holding company and the bank subsidiaries.
5. To review and evaluate investment practices considering the adviser's investment responsibilities for the selection and allocation of investments for various types of accounts, and to determine whether they are appropriate.

6. To evaluate funding sources, including indebtedness, and their management based on maturities and interest rates.
7. To determine the adequacy of internal and external audits.
8. To determine whether the adviser company has adequate policies and procedures to prevent self-dealing and similar improper conflicts.
9. To determine whether operating practices provide for adequate legal documents and agreements such that the account activities, in general, are consistent with the contractual responsibilities and authorities.
10. To determine if any litigation is pending against the company and the possible impact of an unfavorable court decision.
11. To evaluate compliance with applicable bank holding company laws, regulations, and interpretations, including compliance with the standards of care and conduct applicable to fiduciaries as required by Regulation Y.

3130.1.3 INSPECTION PROCEDURES

1. Obtain the company's policy and procedure manuals, and distribute relevant portions to the examiners for review and compliance evaluation.
2. Review the minutes of meetings of the board of directors, audit committees, and any officer-level committees. Ensure that examiners performing other portions of the inspection review relevant minutes or summaries thereof.
3. Obtain, review, and evaluate the adequacy of internal and external audit procedures, reports, and workpapers.
4. Prepare financial statements for the last two fiscal years, plus the interim period, if appropriate. Analyze and evaluate the information for adverse trends and for negative effects on affiliates.
5. Obtain, review, and evaluate internal and external asset-review reports.
6. Evaluate asset quality where warranted, documenting the scope and detailing asset review. Compile classification data, write up classifications if appropriate, and evaluate the adequacy of contra asset allowances.
7. Obtain documentation for all indebtedness. Evaluate funding sources for maturity mismatch, dependence on affiliates, concentrations, and dependability. Review borrowings from affiliate banks for compliance with section 23A of the Federal Reserve Act.
8. Review checking-account statements for all accounts at affiliate banks, checking for overdrafts since the previous inspection.
9. Complete the inspection checklist (see the sections beginning at 3130.1.3.2) based on the guidance provided in section 3130.1.3.1.
10. Identify off-balance-sheet activities and contingent liabilities, and assess the risk to the company and any affiliate.
11. Obtain a listing of litigation against the company or any individuals who represent the company from the company's legal counsel, and summarize the matters in litigation (or in threatened litigation) and any compromise actions. Evaluate the potential effects on the company's financial condition.
12. Evaluate contracts and service agreements with affiliates. Identify whether the company receives or provides services or products. Determine that the services or products are needed and received or provided, and that the contract or agreement terms represent market rates.
13. Review income and expense accounts and transactions with affiliates for compliance with section 23B of the Federal Reserve Act.
14. Evaluate whether the nonbank activities are being performed by affiliate bank personnel or whether bank assets are being used. If so, is the bank adequately compensated?
15. Review FR System approvals, and check conformance with any specified limitations or commitments.
16. Review a sample of recommendations to determine that a reasonable basis exists for the company's recommendations.
17. Review the advisory contracts to determine if there are any conflicts of interests involving the parent company or affiliates, as well as the officers, directors, or principal shareholders and their related interests of the holding company and its affiliates.
18. Evaluate insurance, including bond coverage, for adequacy. Determine the extent of current liability insurance relating to the adviser function, and evaluate the adequacy of such coverage—particularly the extent to which possible significant surcharges would be covered by such insurance.
19. Obtain a listing of shareholders for each class of stock outstanding and a schedule of officers, directors, and their related interests.

20. Obtain or update biographical and experience information for key management personnel, together with overall staffing and salary levels as appropriate for full evaluation.
21. Determine whether operating practices provide for adequate legal documents and agreements such that the account activities, in general, are consistent with contractual responsibilities.
22. Ascertain if senior management is aware, or has adopted the procedures necessary to become aware, of its current and potential responsibilities in connection with any regulatory-reporting and/or regulatory-compliance requirements.
23. Obtain or verify that workpapers contain the following permanent documentation:
    a. System approval letters
    b. date of incorporation or date acquired
    c. date activity commenced
    d. articles of incorporation and by-laws
    e. commitments
    f. supervisory actions
    g. other pertinent correspondence

3130.1.3.1 Scope of Inspection

It is expected that inspections of investment adviser subsidiaries will generally be conducted as part of regularly scheduled bank holding company inspections. If, however, the investment adviser subsidiary provides portfolio management services for a significant portion of trust assets held by a state member bank, the Reserve Bank should inspect the investment adviser subsidiary at the same time it examines the trust operations of the bank subsidiary. The scope of the inspection should be based on a review of the nature and complexity of the financial services provided to customers. An adviser which merely provides investment advice and does not provide any additional financial services, such as portfolio management, safekeeping, recordkeeping, or trading services, may not require an inspection. However, an adviser which provides portfolio management, safekeeping, or other services will require an inspection. To determine the scope of the inspection, it is essential to identify what types of services are being offered to customers and to assess the risks associated with those services.

The examiner needs to understand the adviser's operations, including how it represents itself to clients and whether the adviser has any vested interests in the financial services which it offers. As indicated in SR-88-11 (April 28, 1988), examiners should use their discretion to schedule inspections based on the size and complexity of the adviser's operations. Most section 4(c)(8) BHC subsidiaries will be subject to SEC registration requirements. (See SR-91-4 (SA).) Appropriate checklist questions should be completed for registered investment advisers which provide investment advice to affiliated banks or trust companies and for investment advisers which engage in activities which could have a significant impact on the bank holding company's financial safety and soundness. The checklist should also be completed for all advisers that manage investment portfolios for their customers. The checklist is only a guideline and some of the sections in the checklist may not be applicable. Conversely, the scope of such examinations is not limited to the items included in this checklist.

3130.1.3.2 Inspection Checklist

The questions in this checklist will assist the examiner in evaluating various areas of supervisory concerns.

3130.1.3.2.1 Review of Fundamental Policies and Procedures

The investment adviser's policies and procedures should be reviewed using the following checklist to ensure that fundamental policies and procedures have been established and implemented.

1. Are adequate minutes of the board and board committee meetings prepared?
2. Is the adviser properly chartered and registered?
3. Does the adviser have sufficient blanket bond or other fidelity or liability coverage in place?
4. Is corporate and regulatory reporting performed on a timely basis?
5. Does the above reporting fairly present the accounting and supplemental data reflected by the corporate records?
6. Are internal accounting controls, provided by a segregation of duties or a need for administrative approvals, adequate?
7. Are duties properly segregated in the receiving, disbursing, and recording of cash and cash transactions?
8. Are fee calculations and billing procedures adequate to ensure accuracy and propriety?

9. Are all security transactions authorized or approved by the appropriate management level, and is there documented evidence of the authorization or approval?

3130.1.3.2.2 Supervision and Organization

Supervision refers to the conduct of an adviser's board of directors and senior management in establishing, communicating, and enforcing a system of policies, procedures, and practices suitable to its business objectives and legal requirements. Organization may be characterized as the framework of committees and the assigned responsibilities through which supervision functions. The examiner should (1) review the structure of the organization for adequacy of management information systems and (2) the organization framework as both relate to meeting the entity's stated responsibilities as well as generally accepted standards of conduct. The examiner should review the supervisory function by first identifying the duties and responsibilities of the board of directors. The directors owe the duty of reasonable supervision, including appropriate attention to areas in which the adviser is assuming sensitive and complex fiduciary responsibilities. The next level of review is the committee and officer positions to which certain authority has been delegated. In reviewing this level of supervision, the examiner should keep in mind that certain functions cannot be delegated; for example, approval of significant new services or lines of business, approval of formal policies designed to ensure that the adviser operates in basic compliance with laws and regulations, and the selection and supervision of senior management cannot ordinarily be delegated. Informal delegations and operating practices represent the last level of review. In reviewing both formal and informal delegations, consideration should be given to the institution's size and complexity. A final determination of the adequacy of supervision and organization must be based on findings of the entire inspection of the bank holding company or its nonbank subsidiaries. While topics that have direct or indirect impact on the adequacy of director supervision and management competence are of particular sensitivity, examiners nevertheless have a responsibility to carefully address and comment upon such issues. During the course of the inspection, the examiner should review the supervisory and organizational structure of the bank holding company, with particular reference to investment-related activities. The examiner should determine whether the board of directors has developed adequate objectives and policies.

3130.1.3.2.2.1 Supervision and Organization Checklist

1. If the board of directors does not directly supervise investment adviser activities—
   a. has a responsible board committee(s) been named to exercise this function?
   b. are any delegations consistent with by-law provisions and other appropriate principles?
   c. do the board's minutes nevertheless reflect periodic but timely review of the conduct and operating results of the function?
2. Do minutes of the board, or its committee(s), reflect that members—
   a. attend meetings with reasonable frequency?
   b. require and approve, where necessary, appropriate written policies, strategic plans, and management reports relating thereto?
   c. review audit and regulatory reports (and management proposals and corrective measures in response thereto), litigation developments, earnings and expense reports, and changes to fee schedules?
3. Through adoption of formal policies and provisions for auditing, does the board adequately seek to ensure the integrity of the organization's records and operational systems?
4. Are policies and procedures adequately communicated to officers and staff?
5. Does the board or a board committee consider, periodically review, and provide for insurance protection?
6. Does the bank holding company maintain access to competent legal counsel and, where appropriate, obtain written opinions on significant legal questions such as—
   a. pending or threatened litigation?
   b. account agreements whose terms are unclear or ambiguous or raise complicated points of law?
   c. proposed actions or policies involving matters such as conflicts of interest, restricted securities, ERISA, and other matters involving possible legal exposure?
7. If an account's securities are registered in a nominee name(s)—

   a. is the nominee agreement current?
   b. is the nominee registered with the American Society of Corporate Secretaries (to guard against duplication of the nominee name) and state authorities (where required by local law)?
8. Is staffing adequate, in terms of both numbers and qualifications, to handle the current volume of business?
9. Is there adequate provision for management succession, or for continuing operations in case of the loss of key personnel?
10. Is senior management aware of its responsibilities in connection with, and has it established written policies and procedures to ensure compliance with, any applicable regulatory-reporting requirements?
11. Are significant functions of the investment adviser subject to either internal or external audit? If not, ascertain whether an audit program should either be developed or expanded.
12. When appropriate in light of the size and complexity of the adviser's operations, has management had an audit of financial statements performed by certified public accountants?
13. Have all significant exceptions and recommendations in audits or examinations or inspection reports been corrected, implemented, or otherwise satisfactorily resolved?

3130.1.3.2.3 Portfolio Management

Investment selection is the process whereby the adviser evaluates, selects, and reevaluates those securities or other financial assets it will buy or sell for its clients, or for which it will make recommendations. It includes the process of researching and selecting recommended individual stocks and bonds, and setting objectives or strategies for diversifications by types and classes of securities into general or specialized portfolios, as well as the process of communicating and executing overall strategies for particular accounts.

When an adviser holds itself out as a professional, the adviser will be held to a high standard of prudence and expertise in the investment-selection and -review process. Therefore, advisers must carefully consider policies and procedures in this area in accordance with the size and character of the investment-selection responsibilities undertaken. In furnishing portfolio investment advice, particularly to retail clients, an investment adviser should observe the standards of care and conduct applicable to fiduciaries.[1]

3130.1.3.2.3.1 Investment Standards and Research

1. Are the general investment standards and review and selection responsibilities defined and approved by the board of directors?
2. Does management or senior investment personnel review overall investment policy and potential investment problems at least annually?
3. Is portfolio management policy adequately communicated to appropriate personnel (for example, by including it in committee minutes, directives, or memoranda circulated to such personnel)?
4. Does the institution, where appropriate, diversify investments according to—
   a. types of assets, such as common stocks, fixed-income securities, and real estate?
   b. types of securities by characteristics such as income, growth, and size of company?
   c. types of securities by industry and specific companies within industries?
   d. maturities of debt securities?
   e. geographic location of companies of issue, such as utilities?
   f. tax-exempt income?
5. If the institution has a list of securities approved for purchase, retention, and/or sale—
   a. are recommendations for additions to or deletions from such list(s) approved by a committee or group with appropriate authority and expertise?
   b. are periodic reviews made of the lists of securities approved for purchase, retention, or sale to assess the current appropriateness of the investments listed?
6. If the institution uses any research or analysis in its general investment-review and -selection process—
   a. are appropriate factors taken into account?
   b. is appropriate documentation obtained and filed to reflect consideration of such factors?
7. If the size and character of the entity's discretionary investment responsibilities are such that the type of detailed research consider-

1. The term ''portfolio investment'' is intended to refer generally to the investment of funds in a ''security'' as defined in section 2(1) of the Securities Act of 1933 (15 U.S.C. 77b) or in real property interests, except when the real property is to be used in the trade or business of the person being advised. In furnishing portfolio investment advice, bank holding companies and their subsidiaries shall observe the standards of care and conduct applicable to fiduciaries.

ations and files envisioned in the previous question are not relied on, does it use ratings by acceptable financial-rating agencies, such as Moody's or Standard and Poor's, together with evaluation of basic relevant factors pertaining to the type of security under consideration?
8. Where appropriate, does the organization differentiate its investment-selection process as to the type of account in question, such as those for which the need for growth or income is paramount, or for taxable versus tax-free trusts or retail versus institutional accounts?
9. Do personnel possess sufficient expertise and experience to properly implement the firm's investment-selection systems and responsibilities?

3130.1.3.2.3.2 Account Administration

Special consideration has to be given to accounts subject to the Employee Retirement Income Security Act of 1974 (ERISA), which imposes fiduciary responsibilities upon any person who has any power of control, management, or disposition over the funds or other property of any employee benefit fund. When an adviser exercises investment discretion over such plans, the extensive fiduciary responsibility and prohibited transaction rules of ERISA will apply.

1. Does the adviser have portfolio management procedures which provide for—
   a. consideration of the needs and objectives of particular types of accounts, such as the need for income versus growth or taxable versus tax-free income?
   b. conformity with investment provisions of governing instruments?
   c. consideration of the liquidity needs of the account for anticipated distributions?
   d. appropriate diversification, including avoidance or elimination of concentrations in individual securities and by type and subclass of securities?
2. When assets in discretionary accounts are considered unsuitable, is a program of prudent and timely sale of such assets followed unless retention is required?
3. In order to determine the advisability of retaining or changing assets, does the adviser have procedures for periodic reviews?
4. Do minute books or other records—
   a. identify reviewed accounts?
   b. report written conclusions on the advisability of retaining or disposing of assets in the accounts?
5. As appropriate to the size and character of business, are account synopses and historical data used in the review of account assets?
6. Does the investment-review information include—
   a. amount and description of investment?
   b. categories of investment, such as bonds and stocks?
   c. types of investments within each category, such as industry groups for stocks?
   d. cost?
   e. market or appraised value at review date?
   f. annual income?
   g. yield at market?
   h. rating of recognized financial service?
7. For accounts in which the adviser makes investments at the direction of the client, does the adviser—
   a. review the account to detect illegal, nonconforming, substandard, or otherwise unsuitable investments?
   b. advise the power holder of any improper investments?
   c. inform parties at interest in the account if any improper investment is not disposed of, and seek legal relief, if necessary?
   d. resign from the account if corrective action is not taken concerning improper investments?
8. Have proxy voting policies and procedures as listed below been established for ERISA accounts that are suitable in relation to assumed responsibilities?
   a. voting of routine proxies?
   b. identification and handling of proxy or tender determinations when sensitive social issues, conflicts of interest, significant increases in management power or perquisites, or merger or buy-out proposals are involved?

      NOTE: For requirements relating to proxy processing and the Shareholder Communications Act of 1985, see Operations and Internal Controls in the *Trust Examination Manual*. For questions relating to the voting of affiliate stock, see Conflicts of Interest in the *Trust Examination Manual*.

   When an adviser invests accounts in options and/or futures, the following checklist questions (numbers 9 through 13) should be completed. For additional information as to appropriate uses of options and futures contracts, see SR-83-2(SA) and SR-83-39(SA).

9. When an adviser uses options and/or futures, has the board of directors or a directors'-level committee approved a policy and strategy for their use? Does the policy address—
   a. the investment objectives to be accomplished by the use of these contracts?
   b. the specific types of contracts to be used?
   c. the types of accounts authorized to use these contracts?
   d. restrictions and/or conditions upon use of contracts, such as selection of brokerage houses, position limits, time frames, leveraging, etc.?
10. Was adequate disclosure made and adequate authorization obtained to execute contract transactions for various types of participating accounts?
11. Are adequate systems and controls in effect to ensure—
    a. proper tax treatment?
    b. proper segregation of securities and/or monies?
    c. conformance with account objectives?
    d. adherence to adopted strategy, position limits, and related program parameters?
    e. periodic management evaluation and reporting systems with respect to—
       - results of contract activities upon overall investment performance?
       - market developments, including current liquidity of relevant futures and options contracts in which positions are taken?
       - financial condition, fee competitiveness, and performance of involved broker-dealers?
12. Does the accounting system accurately reflect contract activities with respect to—
    a. transaction details?
    b. current gains or losses on open contract positions?
    c. necessary tax information?
13. Do operating personnel appear sufficiently knowledgeable relative to the level of contract-transactions activity?

3130.1.3.2.4 Conflicts of Interests

The inspection of an investment adviser subsidiary which provides services to an affiliated trust company or bank with a trust department requires expanded inspection procedures. Often the investment adviser subsidiary was organized for the purpose of providing investment advice and services for the trust accounts held at one or more of its affiliates. These subsidiaries often employ the same individuals who worked in the banks or trust company which they advise.

Conflict-of-interest problems may arise when the adviser exercises any ''discretion'' when there are mutually opposing interests. The most serious conflict of interest is self-dealing, which could include transactions such as an investment in affiliated banks or the purchase of securities from or through an affiliate. To resolve conflicts of interest, such transactions and the fees associated with them must be fully disclosed and authorized by the appropriate parties.

Potential conflict-of-interest situations are not limited to transactions between affiliates, but can be between the adviser and any of its directors, officers, or employees individually. Due to the complexity, sensitivity, and exposure involved in conflicts of interest, it is particularly important that an adviser develop the awareness and policies and procedures to identify and deal with conflicts situations. Therefore, it is considered highly desirable, even when not specifically required by regulation, that written policies be adopted and periodically revised as necessary.

3130.1.3.2.4.1 Self-Dealing

1. Has the adviser—
   a. acquired any assets from itself or its affiliates?
   b. acquired any assets from directors, officers, or employees of the organization or its affiliates, or from any other individuals with whom a connection exists that might affect their best judgment?
2. Has the adviser sold or transferred any account assets, by loan or otherwise, to—
   a. any affiliates?
   b. directors, officers, or employees of any affiliates?
   c. other individuals or corporations with whom such a connection exists or other organizations in which such an interest exists that might affect the exercise of its best judgment?
3. Has the company purchased any securities for a customer account from any member of an undivided syndicate for which the adviser or any of its affiliates are participating, or from a private placement which the adviser assisted?

4. Does the company have satisfactory policies and procedures, in terms of its size and character of business, to address the preceding situations?
5. If the company directs extra fee-producing business to itself or an affiliate (for example, brokerage services or options-trading services), or if it charges separate fees to accounts for securities transactions or other services commonly provided as part of general account administration (for example, fees for cash management or investments in mutual funds when management or administration fees are received by the company or an affiliate)—
   a. has it identified those accounts which may properly participate in such services in accordance with adopted policy, legal opinion, a Department of Labor ruling, and/or other necessary determinations?
   b. has it made appropriate prior disclosures and obtained adequate specific authorizations for those accounts identified as entitled to the services?
6. Have any assets held by the company in one account been sold to another account? NOTE: The transaction may be permissible if appropriate disclosure is made, authorization is received, and the law or the governing instrument do not prohibit it. However, an interaccount transaction for ERISA accounts may be a prohibited transaction. In addition, difficult problems can arise in establishing or documenting a ‘‘fair’’ price for the transaction, particularly if the asset is a thinly traded security or is a unique asset.
7. Does the company have appropriate policies and procedures to ensure—
   a. its discretionary accounts are not left in uninvested cash positions beyond a minimum period of time?
   b. its accounts are invested in affiliate interest-bearing deposits only for appropriate temporary or other purposes? NOTE: To the extent the company has long-term affiliate deposits or significant aggregate holdings, a special review should be made of the company’s documentation evidencing the suitability of such investments in view of available alternate vehicles.
8. Are securities of affiliates only purchased upon proper direction or specific authorization in account instruments?
9. When the adviser purchases securities which are underwritten by an affiliate, does the adviser do so only upon proper direction and specific authorization of the customer?
10. Does the company act as investment adviser to an open-end or closed-end investment company that is registered under the Investment Company Act of 1940? If so, do its activities conform with the Board’s interpretation at 12 C.F.R. 225.125, which defines the scope of permissible activities?

3130.1.3.2.4.2 Broker Selection

1. When volume of activity warrants, is allocation of brokerage business controlled through an approved list which is periodically reviewed and approved by the company’s board or a senior-officer-level committee?
2. Does management attempt to obtain the best service for customers, including periodic evaluations of broker qualifications such as—
   a. financial condition?
   b. past record of good and timely delivery and payment on trades?
   c. quality of execution and ability to handle specialized transactions?
   d. quality of research received, if applicable?
3. Are there procedures to monitor or periodically survey available negotiated commission prices in order to ascertain reasonable costs for the execution requirements of its accounts?
4. If commissions higher than the ‘‘lowest’’ available negotiated commissions are being paid for executions in order to receive goods and/or services—
   a. have such goods and/or services been determined to reasonably qualify as ‘‘brokerage and research services’’ as defined in section 28(e)(3) of the Securities Exchange Act of 1934?
   b. does an appropriate committee periodically (at least annually) review and determine that the value of the goods and services justifies the payment of the higher brokerage commissions?
5. Does the entity periodically review and maintain records of all goods and/or services received from brokers or third parties in return for brokerage and/or dealer business allocated to particular firms?
6. Do policies and procedures preclude—
   a. selection of broker-dealers on the basis of deposit balances?
   b. agreements or understandings for allocation of specific amounts of business to a

broker-dealer such that the adviser company would not be able to cease allocating business to the firm if it were no longer providing acceptable execution?

7. Are auditing and other monitoring controls and reporting procedures in effect to verify the compliance of traders with policies regarding broker selection and payment of commissions? NOTE: Under section 28(e) of the Securities Exchange Act of 1934, the adviser may also legitimately pay more than the lowest-available commission for reasons of execution, financial soundness, and efficiency of delivery and payment.
8. In addition to advisory services, are brokerage services provided for customers pursuant to section 225.28(b)(7)(i) of Regulation Y? If so, the examiner should refer to the discount brokerage examination procedures in SR-85-29 (FIS), which contains guidelines and checklist questions for the inspection of brokerage activities.

3130.1.3.2.4.3 Trading Policies and Practices

1. When trading specialists are employed, are there adequate written or unwritten standards of competence, education, and training for such individuals?
2. When specialists are not employed, are the individuals responsible for trading reasonably trained and informed in relation to the volume and character of trading activity they are required to perform?
3. When transactions are permitted to be crossed between accounts, are procedures adequate to ensure fair pricing of the transactions? If it is not clear the transactions are permitted, has the company determined through counsel that crossing is permissible under applicable law?
4. When specialists are employed and volume of activity permits, are block trades considered in order to obtain more favorable trade prices and execution prices for accounts?
5. If applicable, do procedures, including establishment of time frames in advance of such trading, require special authorization and attention for large or block trades which are to be executed in a number of transactions?
6. If procedures permit the combining of purchase or sale orders of the same security—
   a. are resulting benefits in price and/or execution costs applied on a pro rata or average basis to the participating accounts?
   b. are allocable shares similarly pro-rated to participating accounts when a combined trade is not executed at once, but in a number of transactions over a period of time?
7. Does the adviser maintain policies ‘‘reasonably designed to prevent the misuse of material non-public information?’’

3130.1.3.2.5 Recordkeeping

Registered investment advisers are subject to extensive recordkeeping requirements. SEC Rule 204-2 imposes recordkeeping standards and requires that registered investment advisers keep accurate records. In addition to this recordkeeping, the adviser is subject to the ‘‘brochure rule’’ (Rule 204-3). This rule requires an investment adviser to deliver a specified disclosure statement with respect to its background and business practices to every client or prospective client. In addition to an initial disclosure, the adviser must offer annually to deliver a current disclosure statement upon request. Those advisers which have custody or possession of securities of any client must maintain certain additional records, including separate ledger accounts for each client, copies of confirmations, and a position record showing the interest of each client and the location of the securities.

1. Does the investment adviser make and keep current appropriate books and records including—
   a. journals or summary journals?
   b. a memorandum of each order given by the firm or instructions received, showing terms and conditions of the orders?
   c. all checkbooks, bank statements, canceled checks, and cash reconciliations?
   d. all bills or statements, paid or unpaid?
   e. trial balances, financial statements, and internal audit papers?
   f. written communications received or sent by the firm?
   g. list of discretionary accounts?
   h. powers of attorney and discretionary powers?
   i. written agreements?
   j. copies of each notice, circular, advertisement, newspaper article, investment letter, bulletin, or other communication recommending the purchase or sale of a security?
2. Does the adviser maintain a record of every transaction in which the adviser or any

"advisory representative" has a direct or indirect beneficial interest?
3. Are partnership articles, articles of incorporation, charter, minute books, and stock certificate books maintained at the adviser's principal office?
4. If required books and records are photocopied or microfilmed, or if they are produced or reproduced on computer storage media—
   a. are such media indexed and arranged to permit immediate location of any particular record?
   b. were any copies or printouts of such records promptly provided on request?
   c. is at least one copy of the original records that are now on such media stored in a separate location from the original for the time required?
   d. does the adviser maintain procedures for the maintenance and preservation of, and access to, records so as to reasonably safeguard them from loss, alteration, or destruction?
   e. does the adviser have facilities for the immediate, easily readable projection of microfilmed records and for producing easily readable facsimile enlargements?
5. Do the entries in the general ledger and journals properly reflect payments or receipts of monies or other goods or services?
6. Do the financial statements, canceled checks, deposit slips, and check register properly reflect payments or receipts of monies or other goods or services?
7. When the adviser's financial records indicate that it is capitalized with client funds (through either loans or equity), have adequate disclosures been made to clients about the risks and conflicts of interest involved?

3130.1.3.2.6 Security Storage and Processing

Investment advisers generally do not take possession and control of client funds and securities. However, in those cases in which such responsibilities are assumed, the inspection must evaluate those internal controls which are in place for the safeguarding of client funds and securities. Controls and related processing procedures must be appropriately designed and implemented by the adviser to efficiently and safely facilitate such operations.

1. Does the adviser have custody of client funds or securities?
2. Does the adviser gain effective access to client assets through practices, arrangements, or relationships with clients, such as trustee, executor, or account signator?
3. When the adviser has custody of client funds or securities, does the adviser maintain the following records:
   a. a record reflecting all purchases, sales, receipts, and deliveries of securities, and all debits and credits to such accounts?
   b. a separate ledger account for each client, showing purchases, sales receipts, and deliveries of securities?
   c. copies of confirmations of all transactions for such clients?
   d. a record for each security in which any client has a position, reflecting the name of the client, amount of interest, and location of security?
4. When the adviser renders investment-management services, are the following records maintained:
   a. for each client, a record of securities purchased and sold, containing the date, amount, and price of each transaction?
   b. a record for each security in which any client has a current position, showing the name of each client and current interest or number of shares owned by each client?
5. Are client assets physically segregated from the adviser's own assets?
6. For the vault and other related security-processing areas, are adequate controls/safeguards in effect which include the following:
   a. Are assets maintained under a system of joint custody or dual control?
   b. Is access to these areas restricted to designated/authorized personnel?
   c. As appropriate, are other controls/safeguards systems in place (for example, rotation of assignments, key/lock combinations, or vault or area entrance log(s))?
   d. Is a security-ticket system used as a vault and asset-movement control system?
7. If a security-ticket system is used, are adequate controls/safeguards in effect which include the following:
   a. Are security tickets prenumbered?
   b. Does each copy of the security ticket clearly indicate its destination to ensure prompt and accurate delivery?

c. Does the security ticket provide the necessary information to ensure proper processing and recording of the transaction?
d. Does the security ticket contain sufficient copies to ensure that sound internal control is maintained over the physical security-movement process by providing the following with a copy (or copies):
   - portfolio managers who initiated the transactions?
   - appropriate vault/operations personnel?
   - the audit/asset control function?
e. Are unissued security tickets properly safeguarded and subject to adequate numeric controls?

8. Does the control of security ticket/transaction cancellation and replacement include—
   a. restricting the ability to initiate such action to supervisory personnel?
   b. reporting such activity to the audit/asset control function and other function(s) affected by such action?
   c. procedures to ensure that securities are returned to the vault or that funds charged from an account are redeposited, or that the securities or funds are immediately placed under the control of a new security ticket/transaction?
   d. identifying a replacement security ticket by recording such information on the replacement ticket?
   e. requiring all copies of the replaced security ticket to be forwarded to the audit/asset control function?
9. For assets received, are adequate controls/safeguards in effect which include the following:
   a. Are all assets received promptly placed under joint custody or control?
   b. Is appropriate documentation required and on file for all assets received, and is it compared to actual assets received and posted to control ledgers?
   c. As applicable, are procedures in place for controlling and properly handling assets received by other means, including delivery by mail or messenger?
   d. If assets are not to be physically held or issued (for example, mutual fund shares), is a receipt, statement, or acknowledgment obtained from the issuer or holder and processed by receipt ticket or other means to ensure proper accountability?
   e. If securities received are not properly registered in the company's nominee name, are procedures in place to ensure prompt re-registration, control, and follow-up until re-registration?
10. For the delivery of assets, are adequate control/safeguards in place which include the following:
    a. Are appropriate receipts obtained and on file for securities delivered?
    b. Are procedures in place to ensure that bearer securities are not mailed in amounts in excess of the company's insurance limits?
11. Do vault custodians—
    a. compare securities received/withdrawn to the security ticket?
    b. for withdrawals, verify that the security ticket is signed (initialed) by authorized personnel?
    c. for securities temporarily withdrawn from the vault (for example, for transfer, re-registration, or account/portfolio manager review), is a copy of the security ticket retained by vault personnel pending the return of the security to the vault?
12. For pending security transactions, are adequate controls in effect which include the following:
    a. Are pending items periodically reviewed by operations personnel?
    b. Do procedures provide for prompt follow-up on items which have not been completed within established time periods?
    c. Are exceptions promptly reported and resolved by appropriate personnel (for example, management, supervisors, and/or the audit/asset control function)?
    d. Are current pending security items in compliance with established procedures for reporting exceptions, and are those transactions which have not been completed within established time periods been followed up satisfactorily?
    NOTE: Examiner judgment should be used in determining the scope of this review. However, at a minimum, the review should include procedures for handling security transactions pending 30 days or more.
13. Does the security-processing system—
    a. contain a sufficient number of controls/safeguards to properly reflect the current status of and limit an individual's control over a security transaction?

   b. contain sufficient information to identify, locate, and trace the movement of each asset?
   c. provide for adequate segregation of duties and responsibilities?
14. Has individual accountability or responsibility been properly assigned for the physical protection of the securities and related cash flow, if applicable, throughout the security-processing system?
15. Do procedures require that orders for trades originate with account or portfolio managers, with the signature or initials of the authorizing party shown on the order form or purchase/sale ticket?
16. Are transactions made on a first-in, first-out basis (that is, executed in order of receipt), except when combined in blocks for execution pursuant to appropriate written procedures?
17. Do operations personnel perform independently of account or portfolio managers to—
   a. reconcile trade tickets to brokers' confirmations?
   b. monitor and promptly follow up on any outstanding transactions, such as confirmations not received within specified time periods or purchases/sales which have not settled on settlement date?
   c. promptly post payments for purchases/sales to the recordkeeping system and promptly record/remove assets?

3130.1.3.2.7 Other Matters

1. Is the adviser or any of its principals involved in litigation or arbitration which will have an impact on its ability to fulfill its contract with clients?
2. Were any matters of a material nature found in the adviser's correspondence, such as significant client complaints?
3. Did a review of customer-complaint files reveal any possible areas for special inspection focus?
4. Did a review of the adviser's current financial condition raise concerns as to the adviser's solvency or its ability to otherwise continue to provide advisory services?
5. Are there any other aspects of the adviser's operations, or the operations of an affiliate, which raise concerns?

3130.1.4 INSPECTION FINDINGS

A written summary of the subsidiary's activities should be presented to the examiner in charge of the bank holding company inspection and should be included in the inspection report or its supporting workpapers. Material exceptions should be noted with management's responses under an appropriate caption in the open section of the report. Any comments in the report regarding the scope of the investment advisory inspections should note that such inspections are primarily focused on safety-and-soundness considerations and not on compliance with securities laws.

In those cases in which a separate Report of Bank Holding Company Inspection on Investment Advisory Activities is prepared, examiners may use the Uniform Interagency Trust Rating System (see SR-98-37 FRB, revised October 13, 1998, and effective January 1, 1999), which provides a basis for the evaluation of critical areas of supervisory concern. The rating system is generally used by federal supervisory agencies to assess the condition of trust companies. However, the system can be adopted to report on advisory operations as well. When the inspection uncovers significant deficiencies which require corrective action, and the inspection was not done in conjunction with a concurrent bank holding company inspection, a separate report should be prepared and delivered to the inspected nonbank adviser. Send a copy of the summary and any report comments to the Trust Activities Program, Washington, DC 20551.

3130.1.5 ON-SITE INSPECTION BY TRUST EXAMINERS

An investment advisory subsidiary of a bank holding company will normally be registered as an investment adviser under the federal securities laws, and will be subject to examinations of its advisory activities by the Securities and Exchange Commission (SEC). Nevertheless, because investment responsibility is involved in any investment adviser's activities, and since the SEC's routine examinations may be infrequent, periodic on-site inspections should be conducted as an integral part of BHC inspections.

Consideration should be given to using trust examiners to conduct, or at least participate in, on-site inspections of financial and investment advisory nonbank subsidiaries, especially when the subsidiary provides services to an affiliate bank trust department examined by the Board of Governors of the Federal Reserve System. If the bank holding company has to ''spin off'' the investment research and selection process of its banks' trust departments into an investment advisory subsidiary, there may be a need to review the activities of the trust departments together with those of the advisory subsidiary through an on-site inspection.

The companies being advised on a contractual basis and which were sponsored by the holding company or any affiliate are also defined as affiliates in sections 23A and 23B of the Federal Reserve Act. The examiner should therefore be alert to any intercompany transactions between a bank subsidiary and the advised company. A review of financial statements of such companies is warranted.

3130.1.6 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Limitations and activity approval	15 U.S.C. 80; section 23A FRA 371c	225.28(b)(6) 225.125	4–177	1997 FRB 275 1971 FRB 512 1972 FRB 149, 571
Activity approval—real estate development advisers for state and local governments		225.28(b)(6)		1997 FRB 275 1980 FRB 962 and 984

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

This section renders inspection guidance on financial and investment advisory activities that are provided in connection with mergers, acquisitions, divestitures, investments, joint ventures, leveraged buyouts, recapitalizations, capital structurings, and financing transactions and similar transactions, and on conducting financial-feasibility studies.[1] This section also provides historical examples of financial and investment advice previously approved by Board order. The examples consist of various kinds of advice with regard to mergers and similar corporate transactions under the current Regulation Y, section 225.28(b)(6)(iii). Some of the examples of advisory nonbank activities were approved for inclusion into Regulation Y long before the revision of Regulation Y that was effective April 21, 1997. The reader of these examples must only take into consideration the current provisions of Regulation Y. There should be no reliance on Board order commitments, old regulatory provisions, supervisory policies, and interpretations made before April 21, 1997, unless they were not revised. Certain former provisions or commitments may no longer be applicable. The historical examples discussed in this section have been revised according to the new regulatory provisions.

If inspection objectives and procedures are stated in a specific section, the examiner should use this specialized guidance. In addition, the examiner should use the generalized inspection objectives and procedures in section 3130.0, which are generally applicable to all advisory activities.

3130.3.1 ADVISER TO A MORTGAGE OR REAL ESTATE INVESTMENT TRUST

An adviser to a mortgage or real estate investment trust (REIT) furnishes expertise in the areas of funds acquisition, lending, investing, and servicing that is similar to the role of adviser to a mutual fund. The contracted service is performed on a fee basis that is generally based on a percentage of the trust's total assets. The intention of the exemption, found in section 225.28(b)(iii) of Regulation Y, is to allow the relationship to be advisory in nature as opposed to controlling. However, in some instances, the relationship between trusts and their advisers has gone beyond the parameters of advice and resulted in legal entanglements, conflicts of interest, and financial exposure for the bank holding company. Because of the potential risk exposures which may result when a bank holding company or its subsidiary engages in this activity, the overall relationship must be subject to particular scrutiny during an inspection.

REITs were established by the U.S. Congress in 1960, effective January 1, 1961. A REIT is a hybrid form of an investment vehicle which is essentially a financial intermediary specializing in real estate lending and investment. A REIT obtains funds by borrowing from financial institutions or other lenders or by issuing shares (equity capital). It invests the funds in real estate, either as a lender or equity owner. REITs are usually owned by passive owners, not operators. REITs are designed to take advantage of benefits within the federal Internal Revenue Code.

There are generally four types of REITs: equity, mortgage, hybrid, and ''finite-life.'' An equity REIT acquires income-producing properties, deriving its earnings mostly from rents. A mortgage REIT provides financing to real estate projects that are owned by others, deriving its earnings from interest charged on the loans. A hybrid REIT combines the equity REIT and the mortgage REIT. The finite-life REIT is structured to self-liquidate within an established time frame.

By meeting certain prescribed requirements during a taxable year, a REIT may function as a conduit with respect to income distributed to its beneficiaries. If at least 95 percent of the trust's income is distributed to the beneficiaries (excluding capital gains), the trust pays no taxes on the distributed income, thus avoiding the double taxation associated with corporations. Therefore, this investment vehicle has the tax advantage of a partnership but offers the limited liability and perpetuity of a corporation.

A REIT must be a corporation (other than an insurance company or bank), an association, or a trust, or it must be managed by at least one trustee, with transferable shares of beneficial interest as form and evidence of ownership. There must be at least 100 beneficial owners, and the trust must elect to be treated as a REIT for tax purposes. A REIT must meet the following threefold gross income test. At least 95 per-

1. Feasibility studies do not include assisting management with the planning or marketing for a given product or providing general operational or management advice.

cent of the trust's income must come from real property rentals, dividends, abatements and refunds of real property taxes, interest on loans, or gains from the sale of securities or real estate, with the further stipulation that no less than 75 percent of the trust's income must be directly related to real property. Also, less than 30 percent of the trust's income can be derived from the sale of any securities held for less than six months and from foreclosure property and real property held for less than four years that is not involuntarily converted.

In addition to the threefold gross income test, there is a twofold investment test which must be met. First, at least 75 percent of the value of the trust's total assets must be real estate assets, government securities, and cash. Second, 25 percent of the trust's total assets may be securities, but the trust cannot hold securities from one issuer which amount to greater than 5 percent of the trust's total assets and more than 10 percent of the outstanding voting securities of the issuer.

3130.3.1.1 Evaluating Advisory Activities for a REIT

A bank holding company may have an insignificant amount of capital invested in the advisory company. However, if the bank holding company or its subsidiaries have extensions of credit or unfunded commitments outstanding, an evaluation of the credit may be needed using normal classification criteria as to their collectibility, particularly if there is substantial risk exposure. Examination/inspection reports of subsidiaries should be reviewed to determine the consolidated exposure. The holding company or its banking subsidiaries may be participating in exchanges or swaps with the advised REIT, whereby trust assets are exchanged for forgiveness of bank debt. Such pending asset swaps should be considered in conjunction with the credit evaluations. The swaps may be for the purpose of reducing the REIT's liabilities, which can involve an exchange of assets with the lender. The lender's balance sheet reflects an exchange of one asset for another together with, possibly, a lump-sum payment of cash to the trust. If a swap is pending, review the criteria that the holding company used to (1) determine the benefit of the swap to the company and (2) select which of the REIT's assets would be considered for the swap. Also, determine the amount of any cash or earning assets that will be given to the trust.

A holding company and a trust have separate and distinct shareholders but common management. The potential exposure in such cases may be pronounced. Such relationships should be reviewed for conflicts of interest. Loans may be booked by the holding company or its subsidiary and subsequently sold to the trust. The credit decision may have been made by the subsidiary, and the REIT's purchase of the loans may have been approved by the affiliated adviser. The benefits to the holding company may include receiving the origination fee and selling the loan to the trust, thereby increasing the REIT's assets, upon which the holding company's advisory fee is based. Following receipt of the sale's proceeds, the process may be repeated. If the holding company has participated in this type of process, there is potential for a conflict of interest. The holding company or its subsidiary may have to repurchase the credit.

Theatened or pending litigation may result from loans that were originated by the holding company or its subsidiaries or that were recommended by the adviser. The number of such loans together with the current payment status of the credit should be determined. If there are numerous loans on a nonaccrual status, the holding company may have accumulated a significant loss. Finally, any suit involving the adviser which pertains to services it performed should be explored as to its validity and potential financial exposure.

3130.3.2 INSPECTION OBJECTIVES

1. To determine the level of risk involved when the bank holding company or its subsidiaries have extensions of credit and unfunded commitments outstanding to the advised trust.
2. To review for conflicts of interests in cases when a holding company and a trust have separate and distinct shareholders but common management.
3. To review all threatened or pending litigation involving loans originated by the holding company or its subsidiaries that were recommended by the adviser.
4. To review all covered transactions between a bank holding company's subsidiary bank and a REIT, if the REIT is sponsored and advised on a contractual basis by the bank or any subsidiary or affiliate of the bank, to ensure that transactions are permitted pursuant to sections 23A and 23B of the Federal Reserve Act.

5. To determine whether the REIT has been advised to sell real estate in the ordinary course of business and, if so, whether the appropriate liability account for corporate federal and state taxes has been established by the advised subsidiary.
6. To determine whether the REIT adviser is providing the appropriate advice to the REIT to generate nonspeculative high yields; adequate liquidity; portfolio diversification; sufficient cash flow to pay dividends; continuous repricing; and adequate public disclosure, including the extent of risk involved.
7. To determine the adequacy and quality of professional management and the level of management's equity stake in the REIT.
8. To determine the effect on net earnings from floating interest rates on asset yields that may have been caused by prepayment risk.

3130.3.3 INSPECTION PROCEDURES

1. Determine if there are any significant extensions of credit or unfunded commitments outstanding. If so—
   a. evaluate the credit using normal classification criteria as to collectibility;
   b. review examination or inspection reports of the holding company's subsidiaries and determine the consolidated exposure; and
   c. review any pending asset swaps in conjunction with the credit evaluations, if the holding company or its banking subsidiaries are participating in exchanges or swaps with the advised REIT whereby trust assets are exchanged for forgiveness of bank debt.
      - Review the lender's balance sheet to make certain that it reflects an exchange of one asset for another, as well as any lump-sum payment of cash to the trust.
      - Review the criteria the holding company used to (1) determine the benefit of the swap to the company and (2) select which of the REIT's assets would be considered for the swap.
      - Determine the amount of any cash or earning assets that will be given to the trust.
2. Determine and evaluate any significant conflicts of interests in cases when a holding company and a trust have separate and distinct shareholders but common management.
   a. Determine if there are any loans booked by the holding company or its subsidiary and subsequently sold to the trust, if the credit decision was made by the subsidiary, and if the REIT's purchase of the loans was approved by the affiliated adviser.
   b. If significant conflicts of interest exist, determine whether the holding company or its subsidiary must repurchase any associated credit.
3. Review all threatened or pending litigation involving loans originated by the holding company or its subsidiaries that were recommended by the adviser.
   a. Determine the number and amount of such loans together with the current payment status of the credit and whether any loans are on a nonaccrual status.
   b. Evaluate any suit involving the adviser that pertains to services it performed as to the suit's validity and potential financial exposure.
4. Evaluate the effect on net earnings and dividends that declining rates (floating-rate assets) have on the prices of floating-rate mortgage assets. Determine the results and the nature of any hedging strategies that are used to offset a decline in net earnings.

See also the inspection procedures in sections 3130.0 and 3130.1.

3130.3.4 FINANCIAL ADVICE ON ISSUING SECURITIES OF FOREIGN GOVERNMENTS IN THE UNITED STATES

3130.3.4.1 Financial Advice to the Canadian Federal, Provincial, and Municipal Governments

An example of providing financial and investment advisory activities is a Board order that was previously approved (now authorized under section 225.28(b)(6)(iii) of Regulation Y). The order specifically authorized the providing of financial advice to the Canadian federal and provincial governments for issuing their securities in the United States. Also, the Board's Regulation K authorizes the provision of such investment, financial, or economic advisory services to foreign governmental entities (see section 211.10(a)(8)). The Board approved the proposed activity on February 12, 1988 (1988 FRB 249).

Another Board order authorized a foreign bank, subject to the BHC Act, to acquire a securities firm to engage in this activity, but to expand the activity to include the providing of such advice to the Canadian municipal governments in addition to the federal and provincial governments. The Board concluded that the slight modification would not alter the activity to render it less closely related to banking. The Board approved the order on March 28, 1988 (1988 FRB 334). Other approved Board orders for this activity are 1988 FRB 500 and 1988 FRB 571.

3130.3.4.2 Providing Financial Advice to the Japanese National and Municipal Governments and Their Agencies

Another example of providing advice to foreign governments is a bank holding company that applied for the Board's approval to engage, through its wholly owned securities subsidiary, in certain securities-related, foreign-exchange, and investment and financial advisory activities. The activity, which consisted of providing financial advice to the Japanese national and municipal governments, had not previously been authorized for bank holding companies. When making its decision, the Board referred to similar orders as well as to the facts provided. It approved these advisory services by order on June 4, 1990. (See 1990 FRB 654.)

The Board, effective September 10, 1992, added the providing of financial advice to foreign governments, such as advice with respect to the issuance of their securities, to the activities permissible by Regulation Y, currently authorized by section 225.28(b)(iii).

3130.3.5 PROVIDING FINANCIAL-FEASIBILITY STUDIES AND VALUATION SERVICES

The following provides an example of a bank holding company that was authorized to provide financial-feasibility studies and valuation services, including expert-witness testimony in connection with the valuation services. A bank holding company (the applicant) had requested the Board's approval to acquire 100 percent of the voting shares of a company (the company) that engaged in investment advisory, investment management, and financial advisory services. The company engaged in providing (1) financial-feasibility studies for specific projects of private corporations, (2) valuations of companies and of large blocks of utility stock for a variety of purposes, and (3) expert-witness testimony on behalf of utility companies in rate cases.

In providing financial-feasibility studies, all financial aspects of the particular project were evaluated, including economic conditions, sales and earnings statements, balance sheets, and cash-flow data. Each engagement involved analyzing and projecting the income to be generated by a particular project. The Board believed that this activity was functionally similar to the financial advice traditionally offered by banks to their commercial lending customers. The applicant provided evidence revealing that certain major banks perform similar financial-feasibility analysis services for their customers. The Board thus approved the provision of such financial-feasibility studies for corporations. Certain commitments were made to guard against any possible conflicts of interests and related adverse effects between the applicant's credit-extending subsidiaries and the company, acting as an adviser regarding the financial-feasibility studies. Included was the condition that the company's financial advisory activities would not encompass the performance of routine tasks or operations for a customer on a daily or continuous basis.

Upon consideration of the above, the Board also determined the activity of providing valuations of companies, as well as the expert-witness testimony incidental to such valuations, to be permissible. The commercial lending and trust departments of banks commonly make valuations of a broad range of tangible and intangible property, including the securities of closely held companies. The applicant provided evidence that numerous banks compete directly with the company in offering corporate valuations for a fee.

The Board, effective September 10, 1992, added the providing of financial-feasibility studies to the list of nonbanking activities permitted by Regulation Y (see section 225.28(b)(6)(iii)). With the Regulation Y revisions, effective April 1997, the Board specifically determined that feasibility studies do not include assisting management with the planning or marketing for a given project or providing general operational or management advice. The 1992 amendment to this regulation permitted bank holding companies to conduct feasibility studies for high net worth individuals, as well as corporations, and financial and nonfinancial institutions. With the April 1997 amendment, such services could be provided to any person.

3130.3.5.1 Valuation Services

The valuation services included the following activities:

1. the valuation of a company for purposes of acquisitions, mergers, and divestitures
2. tender-offer evaluations
3. advice for management or for a bankruptcy court on the viability and capital adequacy of financially troubled companies and on the fairness of bankruptcy reorganizations
4. valuation opinions on transactions in publicly held securities
5. valuations on the fair market value of employee stock ownership trusts
6. periodic valuation of stock of privately owned companies held in pension or profit-sharing plans, charitable trusts, or venture-capital funds
7. the valuation of a privately owned company or of a large block of publicly owned securities for estate-tax purposes
8. for estate-tax purposes, valuations of a company's common stock and other securities for recapitalization of a privately held company

3130.3.5.2 Utility-Rate Testimony in Support of Utility-Company Valuations

The company frequently provided expert witness testimony on behalf of utility firms in rate cases. The company's personnel were retained to give expert testimony on financial matters such as the cost of capital, economic conditions, and the rate of return expected by investors in utility securities. The Board believed that to a large degree the activity may be considered incidental to the company's general provision of economic information and advice which is permissible under section 225.28(b)(6)(ii) of Regulation Y. Also, banks routinely calculate the cost of capital for customers to advise them regarding financial alternatives.

3130.3.6 EDUCATION-FINANCING ADVISORY SERVICES

Four bank holding companies (collectively, the notificants) gave notice pursuant to section 4(c)(8) of the Bank Holding Company Act (BHC Act) (12 U.S.C. 1843(c)(8)) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) of their intention to each acquire more than 5 percent of a company (the company) that would provide education-financing advisory services.[2] The company would enable state governments to assist parents in financing the higher education of their children.

The company will (1) develop and manage an educational savings and lending program on behalf of the state, (2) design and provide necessary computer software for the program, (3) provide marketing and program materials, and (4) train state personnel to implement the program. The notificants would eventually provide the services to various state governments nationwide.

As part of developing the education savings and lending program, the company would assist in formulating and defining its overall scope; provide the research necessary to begin operations; design the program's operations; and organize the program in cooperation with all interested parties, including coordinating participation among the state authorities. The company would also coordinate key functions of a college-funding program, such as marketing, public relations, training, investment, lending, legal documentation, financial recordkeeping, and ongoing program evaluation. In addition, the company would design, install, and maintain the computer software necessary to implement the program's services. The company's compensation would be based on application fees received by a state educational assistance authority and the amount of investment and loan balances held by the program.

All of the intended services are integrally related to advising and administering student-loan and college-savings programs. Banks offering their own student-loan and college-savings programs engage in many of the planned activities and are uniquely suited to advise and assist other potential providers, including state governments, in structuring and implementing student-loan and college-savings programs.[3] The Board previously concluded that bank holding companies may provide similar advisory and support services to state authorities that are engaged in making student loans.[4] Accordingly,

2. The notificants would have varying ownership interests in excess of 5 percent. Other individual ownership interests of less than 5 percent would be held by various banks and savings institutions located in one state. Each notificant committed that the company would be treated as a subsidiary within the meaning of the BHC Act (12 U.S.C. 1841(d)).
3. See 12 C.F.R. 225.28(b)(1) and (6).
4. See 1985 FRB 725.

based on all the facts of record, the Board concluded that the proposed activities are closely related to banking under section 4(c)(8) of the BHC Act. The Board approved the notice on September 25, 1995 (1995 FRB 1042). Approval of this proposal is specifically conditioned on the notificants' compliance with the commitments made in connection with this notice.

3130.3.7 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws*[1]	*Regulations*[2]	*Interpretations*[3]	*Orders*
Providing financial-feasibility studies, valuation services, utility-rate testimony, but not "public" credit ratings		225.28(b)(6)(iii)		1985 FRB 118, 120
Financial-feasibility studies for issues of tax-exempt revenue bonds and private corporations				1987 FRB 59
Advice in connection with merger, acquisition/ divestiture, and financing transactions and advice regarding loan syndications, interest-rate swaps, and interest-rate-cap transactions		225.28(b)(6)(iii)		1987 FRB 59
Providing financial advice to the Canadian federal, municipal, and provincial governments, such as with respect to the issuance of their securities in the United States		225.28(b)(6)(iii)		1988 FRB 249 1988 FRB 334
Financial advice to the Japanese national and municipal governments		225.28(b)(6)(iii)		1990 FRB 654

3130.4.1 INFORMATIONAL, STATISTICAL FORECASTING, AND ADVICE ON SUCH TRANSACTIONS AS FOREIGN EXCHANGE, SWAPS, COMMODITIES, AND DERIVATIVES

Providing financial and investment advisory activities may consist of a bank holding company's providing information, statistical forecasting, and advice with respect to any transaction in foreign exchange, swaps, caps, and similar transactions, commodities, and any forward contract, option, future, option on a future, and similar instruments.[1] The Board has found financial advice regarding interest-rate swap and cap transactions to be permissible. The Board has also found that providing advice in connection with currency swaps is permissible,[2] as well as providing advice regarding loan syndications.[3] This section provides an example of a February 16, 1983, Board order permitting a bank holding company to establish a de novo subsidiary to offer certain informational, advisory, and transactional services including the provision of the following:

1. General economic information and statistical forecasting with respect to foreign exchange and money markets through time-sharing networks. The services included the analysis of foreign-exchange and money market trends in the context of economic and political developments and the provision of information with respect to foreign exchange.
2. Advisory services designed to assist customers in monitoring, evaluating, and managing their foreign-exchange exposure, including making recommendations regarding policies and procedures to enhance a customer's ability to identify, measure, and manage financial risks in a multicurrency environment. The newly formed subsidiary would also provide advice on the timing of purchases and sales of foreign exchange in both spot and forward markets.
3. Transactional services with respect to foreign-exchange exposures. The subsidiary would arrange foreign-exchange transactions by an affiliated bank holding company and other commercial banks.

As a condition for approval, the applicants were required to seek the Board's authorization if they engaged in any additional activities within the United States. (See 1983 FRB 221.)

Effective February 6, 1984, the Board amended Regulation Y to allow bank holding companies to offer foreign-exchange advisory and transactional services that include providing general information and statistical forecasting with respect to foreign-exchange markets. The activity included arranging for ''swaps'' among customers with complementary foreign-exchange exposures and the execution of foreign-exchange transactions, provided the activity would be conducted through a separately incorporated subsidiary of the bank holding company that will observe the standards of care and conduct applicable to fiduciaries with respect to its foreign-exchange advisory and transactional services.

3130.4.1.1 Inspection Objectives

1. To determine the financial effect of the activity on the parent BHC and its bank subsidiary (or subsidiaries).
2. To determine that the specific activities provided by the company are permissible.
3. To determine that the company is not exposing itself to conflicts of interest between its own role of recommending foreign-exchange positions to its customers and any role its affiliates may have in executing foreign-exchange transactions.

3130.4.1.2 Inspection Procedures

1. Review the company's financial statements for accuracy, and determine if there are any factors or trends that could have an adverse impact on the parent holding company or the bank subsidiary (or subsidiaries).
2. Review the company's policies and procedures to determine that the following are present:
   a. adequate minutes of the board and board committee meetings
   b. adequate blanket bond coverage
3. Review a sample of recommendations to determine that a reasonable basis exists for the company's recommendations.

1. See 62 Federal Register 9,290 (February 28, 1997) (12 C.F.R. 225.28 (b)(6)) or 1997 FRB 275.
2. See 1989 FRB 308.
3. See 1987 FRB 220.

4. Review the company's fee schedule for providing advice and the fees charged by affiliated banks to conduct foreign-exchange transactions for the company's customers. Determine whether bank subsidiaries are being adequately compensated for executing trades, or whether these profits are accruing largely to the benefit of the bank holding company or its nonbank subsidiaries.
5. Review the company's revenue sources to determine that it has not taken foreign-exchange positions and does not execute foreign-exchange transactions.

3130.4.2 FINANCIAL ADVICE AS TO THE STRUCTURING OF AND ARRANGING FOR LOAN SYNDICATIONS, INTEREST-RATE SWAPS, CAPS, AND SIMILAR TRANSACTIONS

A bank holding company may provide information, statistical forecasting, and advice with respect to any transaction in swaps, caps, and similar transactions; commodities; and any forward contract, option, future, option on a future, and similar instruments.[4] The Board has found financial advice regarding interest-rate swap and cap transactions to be permissible.[5] The Board has also found the provision of advice regarding loan syndications to be permissible.[6]

An example of a Board order regarding providing financial advice is one in which a bank holding company (BHC) applied for the Board's approval to establish its company de novo as a financial advisory firm. The Board had not previously approved the structuring of and arranging for loan syndications (see section 225.25(b)(6)(ii) of Regulation Y) or arranging for interest-rate "swaps" and interest-rate caps, and similar transactions (see section 225.28 (b)(6)(iv) of Regulation Y). Interest-rate caps are contractual agreements wherein the seller of a cap agrees to make payment to the purchaser of a cap if a particular interest-rate index (prime) exceeds a predetermined level, with payments calculated on an assumed principal amount for a deferred time period. The caps and swaps are typically used to manage or hedge outstanding positions in the financial markets.

The Board's authorization included the following conditions:

1. The advice rendered by the company on an explicit fee basis will be rendered without regard to correspondent balances maintained by the customers of the company at any depository institution subsidiary of the BHC.
2. Company's financial advisory activities shall not encompass the performance of routine tasks or operations for a customer on a daily or continuous basis. The Board, on November 28, 1986, approved the activity by order (1987 FRB 59). (See 1990 FRB 756.) The Board subsequently, effective September 10, 1992, added this nonbanking activity to the list of activities permitted by Regulation Y. (See section 225.28(b)(6)(iii) for loan syndications and 225.28(b)(6)(iv) for interest-rate swaps and caps.)

Reference can also be made to another Board order (1991 FRB 184) relating to providing advice on joint ventures, leveraged buyouts, restructurings, recapitalizations, and other corporate transactions (see 225.28 (b)(6)(iii) of Regulation Y), as well as to providing advice regarding the structuring and arranging of swaps, caps, and similar transactions relating to interest rates, currency and exchange rates and prices, and economic and financial indexes (see 225.28(b)(6)(iv) of Regulation Y).

3130.4.3 ADVICE RELATING TO THE STRUCTURING OF AND ARRANGING FOR CURRENCY SWAPS

A foreign bank subject to the BHC Act applied for the Board's approval to acquire a company engaged in certain securities, foreign-exchange, and financial advisory activities. The Board previously determined the activities proposed by the BHC, except for providing advice relating to the structuring of and arranging for currency swaps, to be closely related to banking. As for advice on currency swaps, it was noted that most banks that provide advice relating to interest-rate swaps also provide advice relating to currency swaps. Providing advice as to currency swaps was deemed to be functionally and operationally similar to providing advice relating to the structuring of and arranging for interest-

5. See 1989 FRB 308.
6. See 1987 FRB 220.

rate swaps. Both transactions have the common objectives of securing low-cost funds and converting one type of risk to another, and both transactions require similar documentation. The Board approved the activity by order on February 13, 1989 (1989 FRB 308). The Board, effective September 10, 1992, added providing advice as to currency swaps to the nonbanking activities permitted by regulation. See section 225.28(b)(iv) of Regulation Y.

3130.4.4 ADVICE WITH RESPECT TO FUTURES CONTRACTS

3130.4.4.1 Limited Advisory Services with Respect to Futures Contracts on Stock Indexes and Options on Such Futures Contracts

The following is an example of a bank holding company that applied to the Board to engage de novo, through a wholly owned subsidiary, in the provision of advisory services with respect to futures contracts on stock indexes and options thereon. The advisory services to be provided consisted of general research and advice on market conditions and hedging strategies, client-account information and reconciliation of trades, and communication linkage between clients and exchange floors in connection with the subsidiary's futures commission merchant activities. The services offered to customers were provided either as part of an integrated package of services or for a separate fee.

The futures advisory services were essentially identical to the advisory services previously approved by the Board by regulation and order with respect to other financially related futures contracts. The Board concluded the applicant's provision of advisory services for futures contracts on stock indexes and for options thereon to be permissible (1987 FRB 220 and section 225.28(b)(6)(iv) of Regulation Y).

Previously, the Board had approved the execution and clearance of futures contracts on stock indexes and options thereon (1985 FRB 251). At that time, however, the Board had not approved a proposal to provide investment advisory services in connection with the execution and clearance of such instruments.

3130.4.4.2 Advice on Certain Futures and Options on Futures

This section is a historical example of a bank holding company that requested the Board's approval to provide de novo investment advice concerning futures and options on futures contracts on foreign exchange, government securities, and bullion and money market instruments. In addition, the company would provide portfolio investment advice, for which applicant had previously received authorization pursuant to Regulation Y (the authorization is currently included in section 225.28(b)(6)(iv)).

Previously, the Board had approved the provision of investment advice as a futures commission merchant (FCM) (section 225.28(b)(7)(iv)(A)) or as a commodity trading adviser (CTA) registered with the Commodity Futures Trading Commission (CFTC). The provision by an FCM or CTA of such advice could include providing counsel, publications, written analyses, and reports relating to the purchase and sale of futures contracts and options on futures contracts that bank holding company futures commission merchant subsidiaries are permitted to execute and clear. Such advisory services could also consist of providing written or oral presentations on the historical relationship between the cash and futures markets or the functions of futures as hedging devices, demonstrating examples of financial futures uses for hedging, and assisting in structuring a hedging strategy for a cash position. FCMs and CTAs are subject to registration with and regulation by the Commodity Futures Trading Commission pursuant to the Commodity Exchange Act, as amended. (7 U.S.C. 1).

Before incorporation of the advisory activity into Regulation Y (see 1986 FRB 369), the Board had determined by order that the provision of futures and options advice by FCMs is permissible and closely related to banking (see 1985 FRB 168 and 111, 1984 FRB 780, and 1984 FRB 369). A CTA could provide such advice even though it is not acting as an FCM.

The issue presented by this latter proposal was whether the conduct of this activity by company would be a proper incident to banking if company, serving as an adviser, did not meet the *former* Regulation Y requirement of registering with the CFTC as a CTA or FCM. The applicant expected to qualify for a statutory exemption (7 U.S.C.6m) from the registration under section 4m of the Commodity Exchange Act. This exemption provides that any person who, during the previous 12 months, has not furnished commodity advisory services to more than 15 persons and has not represented himself or herself to the public as a CTA is exempt from the registration requirements for CTAs under the act. The applicant's proposal permitted company to provide commodity trading advice without those safeguards. The Board held that it expects the adviser to disclose to its customers substantially the same information required for registered CTAs, including the CTA's performance record, conflicts of interest, possible trading risks, and civil and criminal actions against the CTA.

The Board concluded that the possible adverse effects would be further minimized by the following conditions:

1. Company will remain subject to the antifraud provisions of the Commodity Exchange Act as well as other restrictions in the act.
2. The adviser will not trade for its own account (except to hedge), will limit its advice to instruments that banks deal in extensively (foreign exchange, bullion, government securities, and money market instruments), and will only serve customers that are financially sophisticated and have significant dealings or holdings in the underlying commodities or instruments. The Board approved the application by order on October 18, 1988 (1988 FRB 820).

3130.4.5 PROVIDING DISCRETIONARY PORTFOLIO MANAGEMENT SERVICES ON FUTURES AND OPTIONS ON FUTURES ON NONFINANCIAL COMMODITIES

With respect to the Regulation Y provisions effective April 21, 1997, discretionary portfolio management advice is not separately listed in section 225.28(b)(6)(iv). Discretionary investment advice is discussed, however, within the preamble to the final rule. The preamble emphasizes that such advice may be provided to any person (such advice is no longer limited to institutional investors) regarding contracts relating to financial and nonfinancial assets.

Foreign banking organizations (applicants) subject to the BHC Act provided notice to engage through their subsidiary (company) in providing investment advisory services with respect to futures and options on futures on financial and nonfinancial commodities, including discretionary portfolio management services.[7] The Board previously determined that the proposed activities, with the exception of providing discretionary portfolio management services with respect to futures and options on futures on nonfinancial commodities, are closely related to banking.

The Board had permitted bank holding companies to provide investment advice with respect to futures and options on futures on both financial and nonfinancial commodities. (See section 225.28(b)(6)(iv) of Regulation Y.) The Board also previously approved providing discretionary portfolio management services with respect to futures and options on futures on financial commodities. (See 1995 FRB 386.) In addition, the Office of the Comptroller of the Currency permits national banks to engage in discretionary funds management with respect to futures and options on futures on nonfinancial commodities. (See OCC Interpretive Letter No. 494 (December 20, 1989).)

In this regard, applicants committed that company would provide the proposed discretionary portfolio management services only at the request of the customer. Applicants also committed that company would comply with applicable law, including fiduciary principles. In addition, applicants proposed that company exercise its discretionary portfolio management authority only in purchasing and selling exchange-traded futures and options on futures contracts previously approved by the Board. (See SR-93-27.) The Board gave its approval on June 30, 1995 (1995 FRB 803).

3130.4.6 COMBINATION OF PROVIDING ADVICE WITH OTHER NONBANKING ACTIVITIES

3130.4.6.1 Providing Nonfinancial Futures Advice and the Combining of Foreign-Exchange, Government Securities Advisory, and Execution Services

A BHC applicant requested the Board's permission to engage in trading options on foreign exchange and offering investment advice on financial and nonfinancial options and futures contracts, securities, and interest-rate and currency swaps. The applicant applied to provide these advisory services through a partnership, of which it would own 80 percent of its equity.

7. Company does not trade futures or options on futures for its own account or provide futures commission merchant execution or clearance services.

This partnership would provide these advisory services only to the applicant, its affiliates, and the applicant's partner, a commodity trading organization. The partnership would provide execution services only to the applicant and its affiliates, not to the applicant's partner.

The Board had not previously approved the provision of nonfinancial futures advice for bank holding companies. The Board noted that the Office of the Comptroller of the Currency (OCC), by OCC Interpretive Letter 494 (December 20, 1989), determined that a national bank could provide execution, clearing, and advisory services for customer transactions in standardized, exchange-traded ''nonfinancial'' futures contracts and options, such as futures on oil and agricultural products. The OCC determined that the contracts are financial products and that the provision of investment advice was essentially the same as the advice given with respect to financial futures contracts. The OCC contends that investment advice is incidental to the bank's authority to purchase and sell the instruments on behalf of its customers.

The Board has permitted bank holding companies to provide advice with respect to futures and options on futures relating to bank-eligible securities, bullion, and foreign exchange (12 C.F.R. 225.28(b)(6)(iv)). The Board also has permitted bank holding companies to provide investment advice with respect to options and futures contracts based on broad-based indexes of stock and bonds (1990 FRB 770). The Board thus determined that the provision of investment advice with respect to investing in options and futures, based on nonfinancial instruments, to be the functional equivalent of providing advice on options and futures based on financial instruments. In each case, the bank holding company subsidiary is furnishing advice with respect to trading of a financial instrument. The partnership would not provide advice to third parties without Federal Reserve approval. The Board thus approved the providing of investment advice on nonfinancial futures, options, and options on futures.

The applicant also proposed that the partnership provide execution services to the applicant's wholly owned subsidiary and to the applicant's U.S. branches with respect to—

1. over-the-counter options on foreign exchange, U.S. government securities, and other money market instruments, and indexes on such securities and instruments;
2. exchange-traded transactions in futures, options, and options on futures on foreign exchange, U.S. government securities, and other money market instruments, and indexes on such securities and instruments; and
3. spot and forward transactions in foreign exchange.

The Board previously approved the combination of advice and execution for—

1. foreign-exchange transactions (1990 FRB 649),
2. transactions on derivative instruments based on U.S. government securities and other money market instruments (1990 FRB 664), and
3. securities brokerage (1989 FRB 396).

The Board approved by order the providing of the combination of foreign-exchange and government securities advisory and execution services on December 21, 1990 (1991 FRB 126).

For these reasons, the Board approved the providing of discretionary portfolio management services with respect to futures and options on futures on nonfinancial commodities on June 30, 1995. (See 1995 FRB 803).

3130.4.7 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Provide information and advice on foreign operations and arrange foreign-exchange transactions				1983 FRB 221
Foreign-exchange and advisory and transactional services added to Regulation Y		225.28(b)(6)(iv)		
Financial advice as to the structuring of, and arranging for loan syndications, interest-rate swap, caps, and similar transactions		225.28(b)(6)(iii) and (iv)		1987 FRB 59 1990 FRB 756
Advisory services with respect to futures contracts on stock indexes and options on such futures contracts		225.28(b)(6)(iv)		1987 FRB 220
Providing discretionary portfolio management services on futures and options on futures on nonfinancial commodities		225.28(b)(6)(iv)		1995 FRB 803
Providing nonfinancial futures advice and the combining of foreign-exchange, government securities advisory, and execution services		225.28(b)(6)(iv)		1995 FRB 803
Advice in connection with currency swaps		225.28(b)(6)(iv)		1989 FRB 309

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

The financial and investment advisory nonbanking activity of consumer financial counseling may consist of providing advice, educational courses, and instructional materials to individuals on consumer-oriented financial-management matters, including debt consolidation, applying for a mortgage, bankruptcy, budget management, real estate tax shelters, tax planning, retirement and estate planning, insurance, and general investment management. The authority for this advisory activity is currently derived from section 225.28(b)(6)(v) of Regulation Y.

This nonbanking activity was added to the Regulation Y ''laundry list'' in 1986. Previously, the Board authorized the provision of consumer financial counseling services by order. (See 1979 FRB 65, 1979 FRB 265, 1985 FRB 253, and 1985 FRB 662. These references are only historical examples.) A bank holding company may provide information, statistical forecasting, and advice with respect to any transaction in foreign exchange, swaps, caps, and similar transactions, commodities, and any forward contract, option, future, option on a future, and similar instruments.[1] The Board has found financial advice regarding interest-rate swap and cap transactions to be permissible. The Board has also found that providing advice in connection with currency swaps is permissible,[2] as well as providing advice regarding loan syndications.[3] The revised Regulation Y, effective April 1997, deleted restrictions on consumer-counseling services that prohibited bank holding companies from promoting specific products and services, and from obtaining or disclosing confidential customer information without the customer's consent. These restrictions do not apply to banks that engage in the above activities.

Prudent management should take into consideration certain actions to prevent potential conflicts from arising. When considering these orders, the Board was concerned that the provision of consumer financial counseling activities could potentially result in unfair competition, conflicts of interest, and other adverse effects. (See 1979 FRB 267.) Examiners should be alert to problems that may arise from such conflicts as they review this nonbanking activity. Further, the examiner should determine whether counselors, as a general practice, are advising each customer that they are not required to purchase any services from affiliates, and determine whether customers have the option to exclude themselves from service and product offerings provided by affiliates.

1. See 62 *Federal Register* 9,290 (February 28, 1997) (12 C.F.R. 225.28 (b)(6)) or 1997 FRB 275.

2. See 1989 FRB 308.

3. See 1987 FRB 220.

3130.5.1 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws*[1]	*Regulations*[2]	*Interpretations*[3]	*Orders*
Providing financial-management courses, counseling, and related instructional materials				1979 FRB 265
Engaging, through an acquired bank, in consumer financial counseling				1985 FRB 253
Providing consumer financial counseling services as a permissible nonbanking activity		225.28(b)(6)(v)		1986 FRB 833 1985 FRB 662

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Financial and investment advisory services include tax-planning and tax-preparation services. Tax planning involves providing advice and strategies designed to minimize tax liabilities. For individuals, this includes analysis of the tax implications of retirement plans, estate planning, and family trusts; for corporations, it includes analysis of the tax implications of mergers and acquisitions, the portfolio mix, specific investments, previous tax payments, and year-end tax planning. Tax preparation involves the preparation of tax forms and advice concerning liability based on records and receipts supplied by the client. This nonbanking activity was included in the Regulation Y ‘‘laundry list’’ in 1986. (See section 225.28(b)(6)(vi).) Such services may be provided to any person. Effective April 21, 1997, certain restrictions were removed. These Regulation Y revisions deleted restrictions in the area of tax-planning and tax-preparation services that prohibited bank holding companies from promoting specific products or services and from obtaining or disclosing confidential customer information without the customer's consent. These restrictions do not apply to banks. This fact needs to be considered when referring to the historical examples that follow.

The Board had previously approved, by order (1985 FRB 168), the activity of tax-preparation services for individuals. Since tax-preparation services for corporations is functionally or operationally similar to the tax-preparation services that banks already provide to individuals as well as to their affiliates and other financial institutions, the Board approved the providing of corporate tax-preparation services. When the nonbanking activity was incorporated into Regulation Y in 1986, tax-planning and tax-preparation services were authorized, not only for individuals and corporations, but for noncorporate businesses, such as partnerships and sole proprietorships and tax-exempt nonprofit organizations. Tax-planning and tax-preparation services must be conducted in accordance with applicable jurisdictional law.

3130.6.1 INSPECTION OBJECTIVES

1. To ascertain whether the customer has the option to be excluded from promotions of other specific products and services.
2. To determine what financial effect the activity has on the parent company and its subsidiaries.
3. To determine whether the company has formal written policies and procedures to ensure accurate, timely, and confidential preparation and maintenance of customers' tax returns.
4. To determine whether the tax-return preparers are appropriately qualified to provide such tax services, and to determine the extent of management's involvement in the activity.
6. To identify the potential and extent of off-balance-sheet risk associated with the activity.

3130.6.2 INSPECTION PROCEDURES

1. Review the company's financial statements for accuracy, and determine if there are any factors or trends that could have an adverse impact on the parent company or the bank subsidiaries.
2. Determine whether bonding and other insurance coverage is adequate in relation to the risks associated with the activity.
3. Review pertinent contracts, client lists, public advertising and information, correspondence, and other documentation representing the services provided, and determine if charges for the tax-preparation service are on an explicit fee basis that is not dependent on the amount of tax savings achieved.
4. Determine if the client has a written legal opinion on file certifying that the activity is not considered the practice of law.
5. Review pertinent correspondence and the minutes of board of directors and board committee meetings, and determine if any significant law suits, Internal Revenue Service adverse actions, or other potential or contingency losses are pending and probable because of inaccurate tax-return preparation. Analyze their probable effect in relation to the financial condition of the company.
6. Review the company's formal written policies and procedures for assurance of professional competence in providing sound tax-planning advice and the accurate, timely, and confidential preparation and maintenance of customer's tax returns. The policies and procedures should require that tax-planning advice be clearly communicated by persons who are adequately supervised and who possess the necessary professional technical training and experience needed to provide tax-planning advice.

3130.6.3 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws*[1]	*Regulations*[2]	*Interpretations*[3]	*Orders*
Preparation of tax returns in a non-fiduciary capacity is closely related to banking				1985 FRB 168
Permissible nonbanking activity		225.28(b)(6)(vi)		1986 FRB 833

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

3140.0.1 LEASING AUTHORIZATIONS WITHIN REGULATION Y

Leasing is a form of financing which provides a lessee (the customer) the right to use land or depreciable assets without tying up working capital, and provides the lessor (the owner of the property) with a generally higher rate of return than just lending as a result of the tax benefits that can arise from the ownership of the equipment, real property, or tangible personal property. In 1971, ''leasing personal property or acting as agent, broker, or adviser in leasing such property'' was added to the list of permissible nonbanking activities for bank holding companies under Regulation Y. In 1974, the authority to engage in this activity was expanded to include leasing of real property.

In 1997, restrictions on leasing activities were removed to permit greater flexibility to acquire leaseable property in quantity and to sell or re-lease property upon the lease's expiration. Removed restrictions consisted of the maximum lease term, maximum holding period for leased property, limit on acquisitions of property to specific leasing transactions, restriction on leases to those that served as the functional equivalent of extensions of credit, and 100 percent limit on the amount of reliance that could be placed on the value of leased property. Added clarifications consisted of more details on the requirements for a nonoperating lease, particularly those for automobile rentals.

3140.0.2 PERMISSIBLE LEASING ACTIVITIES

Two types of leasing activities are permissible for bank holding companies: full-payout leasing and high residual value leasing. A *full payout lease* is the functional equivalent of an extension of credit that relies primarily on rental payments and tax benefits to recover the cost of the leased property and related financing costs. *High residual value leasing* may involve significant reliance on the expected residual value of the leased property—on average, under 50 percent. However, this value can extend up to the full original cost of the property (that is, to recover the full acquisition cost of the leased property plus related financing costs).

When leasing personal or real property, or acting as agent, broker, or advisor, only those leasing transactions meeting the following criteria are considered permissible:

1. The lease must be on a nonoperating basis.
2. The initial lease term must be at least 90 days.
3. For leasing involving real property—
   a. at the inception of the initial lease, the effect of the transaction must yield a return that will compensate the bank holding company, as lessor, for its full investment in the property plus the estimated total cost of financing the property over the term of the lease (This includes rental payments, estimated tax benefits, and the estimated residual value of the property at the expiration of the initial lease.) and
   b. the estimated residual value (yield) of the property at the expiration of the initial term of the lease may not exceed 25 percent of the acquisition cost of the property to the bank holding company (lessor).

With respect to leasing personal or real property on a nonoperating basis, this means that the bank holding company or its subsidiary may not engage in operating, servicing, maintaining, or repairing leased property during the lease term. A bank holding company, however, can arrange for a third party to provide the services or products.

As for automobiles, this means that a bank holding company may not (1) provide servicing, repair, or maintenance of the leased vehicle during the lease term; (2) purchase parts and accessories either in bulk or for an individual vehicle after its delivery to the lessee; (3) provide the loan of an automobile during the vehicle's servicing; (4) purchase insurance for the lessee; or (5) provide for the renewal of the vehicle's license (registration) without authorization from the lessor.

3140.0.3 ACCOUNTING FOR LEASES

Leasing has become a prominent financing vehicle. Lessors have employed a number of different methods in structuring and accounting for leases. Statement No. 13 of the Financial Accounting Standards Board (FASB),[1] ''Account-

1. Other FASB releases dealing with leasing are FASB Statements 22, 23, 27, 28, 29, 76, 77, 92, 94, 98, and 109; FASB Interpretations 19, 21, 23, 24, 26, and 27; and FASB Technical Bulletins 79-10, 79-12, 79-13, 79-14, 79-15, 79-16, 85-3, 86-2, and 88-1.

ing for Leases,'' has become the uniform standard in accounting for leases.

The accounting for leases must be viewed from the perspective of the parties involved in the leasing transaction, the lessee and the lessor. Negotiations and closing costs incurred with respect to the lease should be written off over the life of the lease.

In applying FASB Statement No. 13, certain terminology is used. Basic terms that should be considered are described below.

Inception of a lease. The inception of a lease refers to the date the lease contract was signed or the date that the construction was completed, or if earlier, the date of the written commitment stating the significant terms.

Term of the lease. The lease term consists of the noncancelable term and the period comprising the bargain renewal option.

Fair value of lease property. The fair value of a lease consists of the price that the property could be sold in an arms-length transaction.

Economic life of the leased property. The economic life of the leased property represents the period over which the property is expected to be economically beneficial to one or more users for its intended purpose.

Estimated residual value of the leased property (ERV). The residual value is the estimated fair value of the leased property at the expiration of the lease term.

Interest rate implicit in the lease. The implicit interest rate is the discount rate that causes the sum of the minimum lease payments and the unguaranteed residual value at the end of the lease term to be equal to the fair value of the property at the beginning of the lease term.

Lessee's incremental borrowing rate. The incremental borrowing rate is the interest rate at which the lessee could borrow the funds to purchase the leased property.

3140.0.3.1 Accounting for Leases by a Lessee

There are two methods for accounting for leasing transactions by a lessee. These are the operating method and the capitalized lease method.

3140.0.3.1.1 Operating Method of Accounting for Leases

The operating accounting method merely records the cost of the rental payments as an expense when it is required to be paid in accordance with the terms of the lease agreement.

Example: Assume that equipment is leased for $100,000 per year for three years. Under this method, the annual cost would be recorded as a rental expense on the Income Statement:

Dr. Rent	$100,000	
Cr. Cash		$100,000

To record an annual payment of rent based on an operating lease agreement.

3140.0.3.1.2 Capitalized Lease Method of Accounting for Leases

3140.0.3.1.2.1 When a Lessee Is to Use the Capitalized Lease Method

If *any one* of the following conditions exist, the lessee must capitalize the lease:

1. The asset is owned by the lessee at the end of the lease term.

*2. The lease term is equal to or more than 75 percent of the estimated economic life of the asset.

3. The lessee can purchase the asset below its fair market value before or at the end of the lease term (bargain purchase option).
*4. The present value of the minimum lease payments at the beginning of the least term is equal to or more than 90 percent of the fair market value of the property.

*If the lease begins in the remaining 25 percent of the asset's estimated economic life, these items do not apply; such leases are considered operating leases.

Using this method, the lease is recorded as an asset at the lesser of the present value of the rental and other minimum lease payments or the fair value of the leased property as though the lease obligation was being purchased on credit. The payment made is treated as a payment made on an installment debt. At the same time, the asset is being amortized over the lease term. The lease obligation is treated as a long-term debt. The discount rate that is used to capitalize the lease is the lessee's incremental borrowing rate or the interest rate implicit in the lease agreement.

Example #1: This example illustrates the capitalized lease method using the same example as above with the added fact that the lease agreement contains an interest rate of 10 percent. Assume that the interest rate of the lease agreement is the same as the lessee's marginal borrowing rate.

Dr. Capitalized Lease	$248,685	
Cr. Lease Obligation		$248,685

To record an equipment lease obligation under a capitalized lease agreement.

(Present value of $100,000 per year for three years at a 10 percent interest rate)

1st Year

Interest Expense	$ 24,869	
Lease Obligation	75,131	
Cash		$100,000

To record the first year's payment on an equipment lease obligation.

($248,685 × .10 = $24,869)

Dr. Equipment Lease Amortization	$ 82,895	
Cr. Capitalized Lease		$ 82,895

To record the annual amortization of a capitalized equipment lease.

($248,685/3 years)

2nd Year

Dr. Interest Expense	$ 17,355	
Dr. Lease Obligation	82,645	
Cr. Cash		$100,000

To record the second annual lease payment under a three-year capitalized lease agreement.

(Interest = $248,685 + 24,869 – $100,000 = $173,554 × .10 = $17,355)

Dr. Lease Amortization	$ 82,895	
Cr. Capitalized Lease		$ 82,895

To record the second year's lease amortization under a three-year capitalized lease.

3rd Year

Dr. Interest Expense	$ 9,091	
Dr. Lease Obligation	90,909	
Cr. Cash		$100,000

To record the third year's lease payment under a three-year capitalized lease obligation.

(Interest = $173,554 + $17,355 = $190,909 – $100,000 = $90,909 × .10 = $9,091)

The financial statements are to include footnotes that disclose the present value of noncancelable lease commitments where the lessor either recovers more than 75 percent of the economic life of the asset leased or the investment plus a reasonable return.

3140.0.3.2 Accounting for Leases by a Lessor

3140.0.3.2.1 Operating Lease (Lessor)

A lessor would have the following accounting entries for an operating lease:

Dr. Cash	$xxx,xxx	
Cr. Rent Income on Leased Assets[2]		$xxx,xxx
Dr. Depreciation Expense	$xxx,xxx	
Cr. Accumulated Depreciation—Leased Assets		$xxx,xxx

In order for the *lessor* to be able to capitalize a direct financing lease, any one of the same four criteria for a lessee must apply along with two additional criteria:

2. Any rent received in advance would be initially credited to "unearned rent revenue."

1. Collectibility of the minimum lease payments must be reasonably predictable.
2. No important uncertainties exist as the amount of unreimbursable costs incurred.

In accounting for the lessor's capitalized lease transactions, there are some common accounts that are used. These are described below.

Unearned income from lease financing receivables. Unearned income represents the unearned interest liability account that is netted against the total of lease payments receivable which includes the estimated residual value for balance-sheet presentation. It represents the ''interest'' income equal to the excess of rentals receivable over the fair value of the property at the inception of the lease.

Lease financing receivables. This asset account is established in the amount of total lease payments to be received from the lessee. The amount by which the rentals receivable exceeds the cost of the property is the functional equivalent of interest and represents a portion of the income to be recognized over the life of the lease. In the example below, the cost of the property is temporarily charged to a fixed asset account, then transferred to lease payments receivable.

Throughout the lease term, the rentals receivable account is periodically reduced by the full amount of each rental payment received.

3140.0.3.2.2 Direct Financing Capitalized Lease

In this situation, a finance company purchases equipment from a manufacturer (recorded as equipment [asset] when purchased). The finance company (lease financing nonbanking subsidiary) then leases that equipment and records it as a normal financing lease. There is *no* dealer profit from the sale of the asset. Unearned interest income is recognized over the life of the lease using the effective interest method. Since the lessor has ''sold'' the asset, no depreciation is recorded.

Example #1: Lease with No Guaranteed Residual Value by the Lessee

Assume that the finance company purchases equipment costing $100,000. It then leases the equipment to a lessee under a five-year lease agreement that requires annual payments of $25,000 per year. At the end of the lease term, the lessee will own the equipment. The implied interest rate is 7.931 percent (comparison of the present value of the equipment of $100,000 against the $25,000 annual payment for five years).

Dr. Equipment	$100,000	
Cr. Cash		$100,000

To record the purchase of equipment to be leased

Dr. Lease Financing Receivables	$125,000	
Cr. Equipment		$100,000
Cr. Unearned Income from Lease Financing Receivables		25,000

To record the initial lease

Year 1

Dr. Cash	$ 25,000	
Cr. Lease Financing Receivables		$ 25,000
Dr. Unearned Income from Lease Financing Receivables	$ 7,931	
Cr. Income from Lease Financing Receivables		7,931

To record the receipt of the first equipment lease payment.

Lease Payments Receivable	$125,000
Unearned Interest Revenue	–25,000
	$100,000 × .07931 = $7,931

Year 2

Dr. Cash	$ 25,000	
Cr. Lease Financing Receivables		$ 25,000
Dr. Unearned Income from Lease Financing Receivables	$ 6,577	
Cr. Income from Lease Financing Receivables		$ 6,577

To record the receipt of the second equipment lease payment.

Lease Payments Receivable	$100,000	
Unearned Interest	–17,069	($25,000 – 7,931)
(Present Value of Remaining Receivable	$ 82,931)	× .07931 = $6,577

Year 3

Dr. Cash	$ 25,000	
Cr. Lease Financing Receivables		$ 25,000
Dr. Unearned Income from Lease Financing Receivables	$ 5,116	
Cr. Income from Lease Financing Receivables		$ 5,116

To record the receipt of the third equipment lease payment.

Lease Payments Receivable	$ 75,000	
Unearned Interest	–10,492	($17,069 – $6,577)
(Present Value of Remaining Receivable	$ 64,508)	× .07931 = $5,116

Year 4

Dr. Cash	$ 25,000	
Cr. Lease Financing Receivables		$25,000
Dr. Unearned Income from Lease Financing Receivables	$ 3,539	
Cr. Income from Lease Financing Receivables		$ 3,539

To record the receipt of the fourth equipment lease payment.

Lease Payments Receivable	$ 50,000	
Unearned Interest	–5,376	($10,492 – $5,116)
(Present Value of Remaining Receivable	$ 44,624)	× .07931 = $3,539

Year 5

Dr. Cash	$ 25,000	
Cr. Leases Financing Receivables		$ 25,000
Dr. Unearned Income from Lease Financing Receivables	$ 1,837	
Cr. Income from Lease Financing Receivables		$ 1,837

To record the receipt of the fifth equipment lease payment.

Lease Payments Receivable	$ 25,000	
Unearned Interest	–1,837	($5,376 – $3,539)
(Present Value of Remaining Receivable	$ 23,163)	× .07931 = $1,837

Example #2: Lease with a Residual Value (Guaranteed by the Lessee)

A lessor acquires property to be leased for $14,000 (its fair value at the inception of the lease). The estimated economic life of the property is five years. The lease has a noncancelable lease term of four years with a rental payment due of $3,649 at the end of each year. The lessee guarantees the residual value at the end of the four-year lease term in the amount of $4,000. The lessor's implied rate of interest in the lease is 10.8695 percent. The present value of the minimum lease payments at this interest rate and monthly payments exceeds 90 percent of the fair value of the property at the inception of the lease (.90 × $14,000 = $12,600).

Year 1

January 1, 19x1

Dr. Equipment	$ 14,000	
Cash		$ 14,000

To record purchase of equipment for the purpose of a financing lease.

Dr. Lease Financing Receivables	$ 18,596	
Cr. Equipment		$ 14,000
Cr. Unearned Income from Lease Financing Receivables		4,596

To record investment in direct-financing lease

December 31, 19x1

Dr. Unearned Income from Lease Financing Receivables	$ 1,521	
Cr. Income from Lease Financing Receivables		$ 1,521

To recognize the portion of unearned income that is earned at the end of the first year of investment.

(Fair value of property at inception of the lease of $14,000 × 10.8695% = $1,521)

Dr. Cash	$ 3,649	
Cr. Lease Financing Receivables		$ 3,649

To record receipt of the first year's rental

Year 2

Dr. Unearned Income from Lease Financing Receivables	$ 1,290	
Cr. Interest Income from Lease Financing Receivables		$ 1,290

To recognize the portion of unearned income that is earned at the end of the second year of investment

($14,000 + 1,521 – 3,649 = $11,872 × 10.8695% = $1,290)

Dr. Cash	$ 3,649	
Cr. Lease Financing Receivables		$ 3,649

To record the receipt of the second year's rental

Year 3

Dr. Unearned Income from Lease Financing Receivables	$ 1,034	
Cr. Income from Lease Financing Receivables		$ 1,034

($11,872 + 1,290 – 3,649 = $9,513 × 10.8695% = $1,034)

To recognize the portion of unearned income that is earned at the end of the third year of investment

Dr. Cash	$ 3,649	
Cr. Lease Financing Receivables		$ 3,649

To record the receipt of the third year's rental.

Year 4

Dr. Unearned Income from Lease Financing Receivables	$ 751	
Cr. Income Lease Financing Receivables		$ 751

To recognize the portion of unearned income that is earned at the end of the fourth year of investment.

($9,513 + 1,034 – $3,649 = $6,898 × 10.8695% = $751)

Dr. Cash	$ 3,649	
Cr. Lease Financing Receivable		$ 3,649

To record the receipt of the fourth year's rental.

Dr. Cash	$4,000	
Cr. Lease Financing Receivables		$ 4,000

To record the receipt of the lessor's guaranteed residual value (guaranteed by the lessee) at the end of the lease term.

($6,898 + 751 – $3,649 = $4,000)

3140.0.3.2.3 Balance-Sheet Presentation

The lease payments receivable would be reported on the balance sheet as a single amount "net investment" (Lease Financing Receivables less the balance of the Unearned Income from Lease Financing Receivables). If the lessor has established an allowance for possible lease losses, this amount is shown separately as a deduction from the net investment. The net investment in the direct financing lease is $18,000 for example #2 above. It consists of the gross investment of $18,596 ($3,649 × 4 annual rental payments) plus the $4,000 residual value less the unearned income of $4,596.

3140.0.3.2.4 Classification

If it is deemed appropriate to classify a lease, the amount to be classified (in example #2 above) would be the net investment. For illustration, assume that two of the four payments had been received on the lease, that income has been recognized monthly according to the effective interest rate method, and that the lease is now considered a loss. Further assume that the third payment should have been received eight months ago. It is determined during the inspection that the lease should be classified as doubtful of collection. The balance to be classified is the net investment of $7,728. This consists of the balance of Lease Financings Receivable of $9,513 (includes the $4,000 estimated guaranteed residual value) less the balance of Unearned Income from Lease Financings Receivable of $1,785 ($1,034 + $751 = amount due on regular payment intervals) or a net investment of $7,728.

3140.0.3.2.5 Delinquency

It is considered appropriate to state in the inspection report the percentage of delinquency in the lease portfolio. The percentage is calculated by deviding the aggregate rentals receivable on delinquent leases (less unearned income on the delinquent leases) by the total of rentals receivable on all leases (less their unearned income). Estimated realizable values would not be included in the delinquent amounts unless they were guaranteed by the lessee.

3140.0.4 LEVERAGED LEASES

The lessor can ‘‘leverage’’ a lease transaction by borrowing a substantial portion of the acquisition cost from a long-term lender, with the rentals and the property pledged as collateral for the loan. The lessor borrows in order to finance a leasing transaction with a small, or perhaps, a negative equity in the property to be leased.

The initial step in accounting for this type of lease involves calculating the cash flows over the term of the lease. The cash flows include the income tax effects of tax deductions to the lessor, the lessor’s initial investment in the property, the rental receipts net of debt service, and the proceeds expected to be received from the sale of any residual. The next step in accounting for a leverage lease involves determining the applied interest rate that, when applied to the net investment in the years that the net investment will be positive, would precisely allocate the net income to the positive years. See appendix E of SFAS 13 for an example as to how to account for a leveraged lease.

3140.0.5 INSPECTION OBJECTIVES

1. To determine the effect of the investment in the leasing subsidiary upon consolidated operations, and indirectly upon the bank subsidiaries’ safety and soundness.
2. To determine if the company is operating in compliance with applicable laws and regulations, and to ensure that corrective action is initiated if warranted.
3. To determine if policies, procedures, and controls are adequate to protect the company from mismanagement, unnecessary risk, and loss.
4. To assess the management’s ability to operate the company in a safe and sound manner.
5. To determine that accounting practices do not overstate income.

3140.0.6 INSPECTION PROCEDURES

The decision whether the operations of a leasing subsidiary will be inspected ‘‘on-site’’ is based on the availability and adequacy of leasing company data at the offices of the parent company. Item 1 below provides a listing of information necessary to the inspection process. If this and any other information necessary to assess the overall condition of the subsidiary is available at the parent’s office or can be obtained through a written request to the subsidiary, an on-site inspection may not be necessary. The inspection frequency requirements, found in section 5000.0.4, should be reviewed in making such a determination.

1. The following information should be available at the start of the inspection:
   a. trial balance of all leases and outstanding credits,
   b. listing of accounts on which payments are delinquent 30 days or more, or on which payments are otherwise not being made according to schedule,
   c. comparative interim and fiscal financial statements of the leasing company,
   d. listing of unbooked assets and contingent liabilities,
   e. cash-flow projections for the current fiscal year and the next fiscal year,
   f. listing of available lines of credit,
   g. copies of the most recent internal and external audit reports, and
   h. minutes of board and executive committee meetings since the date of the previous inspection.
2. Establish a ‘‘credit line’’ above which all leases will be reviewed. The line can be set at an amount that will cause a certain percentage of the dollar volume of the lease portfolio to be reviewed (e.g., between 70 percent and 80 percent), or at an amount that will cause the review of each lease exceeding a certain percentage of gross capital. Leases on which payments are delinquent are to be reviewed regardless of amount.
3. Analyze the creditworthiness of the lessees. Consideration is given to the figures derived from the lessee’s financial statements, as well as cash flow, trends and projections of growth in sales and income, and the qualifications of management.

   Delinquency on a lease obligation is potentially more serious than delinquency on a conventional loan. If the property under lease is necessary for the lessee’s continued production of income, as is frequently the case, the lessee’s financial condition will be seriously deteriorated before the lessee is willing to risk losing the property by default.
4. For those leases which might result in loss to the lessor, or for which financial information was not adequate to make such a determination, transcribe the following information to line sheets:
   a. name and line of business of lessee

b. name of guarantor(s)
c. original date of the lease contract
d. original amount of the rentals receivable
e. ERV of the property
g. book value of the investment in the lease as of the inspection date
h. cost of the property
i. description and location of the property
j. amount and frequency of rental payments
k. original amount, term, rate, and schedule of amortization of any nonrecourse debt associated with the lease
l. lessor's percentage of equity participation in the lease obligation, if applicable
m. summary financial data indicating the creditworthiness of the lessee, and guarantors, if applicable

5. Before the conclusion of the inspection, discuss with management all classified leases. Inadequate or negative cash flow and unfavorable trends reflected in financial statements of the lessee are usually indicative of a substandard lease. Leases classified doubtful typically include those on which payments are delinquent for an extended period and those on which the lessor's recovery of investment is dependent upon an event of unknown probability, such as a pending lawsuit or insurance claim.

   A loss classification results from the lessee's inability or refusal to continue making payments.
6. Prepare a write-up to support the classifications. The write-up should include the lessee's type of business, present financial status, circumstances which led to the classification, the probability that the terms of the lease can be met, and the amount of protection afforded by sale or re-lease of the underlying property.
7. Review a sample of the lessor's computations of lease yields to determine whether the lessor will recover not less than the full investment in the property plus the estimated total cost of financing the property over the term of the lease. This includes rental payments, estimated tax benefits, and the estimated residual value of the property at the expiration of the initial lease.

   With respect to the full-payout lease, governmental entities may be prohibited from entering into leases for periods exceeding one year. In that case, the bank holding company or its subsidiary (as lessor) should demonstrate that the lease is expected to be continually renewed until the cost is fully recovered.
8. Ascertain whether title to the property rests with the lessor, and that the lessor has taken steps to protect its ownership rights. Evidence of filing under the Uniform Commercial Code, where appropriate, should be found in the documentation file. Aircraft should be registered with the FAA, interstate vehicles with the ICC, and ships with the Coast Guard.
9. Check for cancellation or other provisions in the contract which could jeopardize the full-payout status of the lease. There is no need to take exception to a cancellation provision which provides for payment by the lessee of an amount which allows the lessor to recover fully its investment in the property.
10. Check that insurance coverage is effective on leased property and is provided by the lessee in compliance with all insurance provisions of the contract in an amount sufficient to protect against loss from property damage. Public liability insurance should also be provided to protect against loss from lawsuits which could arise from situations such as the crash of leased aircraft.
11. Review the lessee's duties under the contract with respect to repairs and taxes. Determine whether the lessor has instituted procedures to check that the lessee's required duties are being performed.
12. Review the status of all property acquired for lease purposes but which is not now under lease. Determine the reason for the "off-lease" status of the property, ascertain the realizable value of the property, and investigate whether the off-lease property will be sold or re-leased within the required two-year period.
13. Investigate the lessor's procedures for periodic review of the reasonableness of the estimated residual value. The estimate should be reviewed at least annually and reduced in amount on the books if the value has declined on a presumably permanent basis.
14. Review past operations of the lease company to determine if projections of income and ERV have been realistic in light of actual experience.
15. Review the minutes of the meetings of the board and executive committees to determine whether purchases of property and delinquent leases are reported to the board.
16. Determine if the company has entered into leases with companies owned or controlled by any director, officer, or 10 percent share-

holder of the leasing company or holding company. Compare the rates and terms on such leases to the rates and terms offered on leases to companies of similar credit standing.

17. Check for lease concentrations to any one lessee or industry and prepare a comment for the inspection report if any concentration is considered unwarranted.
18. Determine whether the company has established limits for the maximum amount of ''credit'' to be extended to a single lessee. If such limits have been established, investigate whether the company adheres to them. If they have not been established, inquire as to the company's policy on this matter.
19. Provide the examiner-in-charge with information to be included in the inspection report, including:
    a. scope of the inspection (on- or off-premises)
    b. comments concerning any policies or conditions having an adverse effect on the leasing company or parent company
    c. brief history of the company and a description of its activities
    d. summary analysis of financial factors of the company, including trends in the volume and classification of receivables, adequacy of capital and reserves, return on assets, and contribution to consolidated income and consolidated assets
    e. statutory authority under which the company operates
    f. details of all borrowings of the company from within the holding company system and from external sources
    g. details of any litigation in which the company is a defendant
    h. scope and frequency of audit of the company by both internal and external auditors
20. Compare current earnings performance and balance-sheet ratios of the company with past performance and industry composites.
21. Determine whether cash flows of the company are adequate to service all debts.
22. Assess the adequacy of internal controls over the company's operations.
23. Check for action taken on matters criticized in the most recent audit reports and the previous inspection report. Determine if leases classified ''loss'' were removed from the books.
24. Investigate whether any affiliated banks maintain compensating balances for lines of credit of the leasing company, and if so, whether the leasing company compensates the bank for maintenance of the balances. If ''loss'' leases have not been removed from the books, discuss with management the reasons why the charge-offs were not made. Determine whether the financial statements and reports submitted to the Board of Governors were misstated as a result of the ''no charge-off'' decision.
25. For higher residual value leasing, determine that—
    a. the residual values have been estimated accurately;
    b. residual values are reviewed and adjusted annually;
    c. the initial terms of the lease are at least 90 days;
    d. the lessor relies on a residual value of the leased property that will recoup the acquisition cost of the property and any related financing or other associated costs;
    e. the aggregate book value of all tangible personal property held for such a lease, having an estimated residual value in excess of 25 percent of the acquisition cost of the property, does not exceed 10 percent of the BHC's consolidated domestic and foreign assets;
    f. the BHC maintains separately identifiable records of the leasing transactions and activities; and
    g. each company maintains capitalization fully adequate to meet its obligations and support its activities, and that its capital levels are commensurate with industry standards for companies engaged in comparable leasing activities.

3140.0.7 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Automobile leasing				1976 FRB 930
Consumer leasing	15 U.S.C. 1667			
Higher residual value leasing				1991 FRB 490,187 1990 FRB 462, 960
Personal or real property leasing activities of bank holding companies		225.28(b)(3)		
Special-purpose leasing corporation			3–712	

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

The Board considers the making of equity and debt investments in corporations or projects designed ‘‘primarily to promote’’ community welfare as an activity closely related to banking. The Board includes such investments in the list of permissible nonbanking activities in Regulation Y; however, bank holding companies must obtain prior approval to engage in these activities. The Board, effective April 21, 1997, included the provision of advisory and related services for programs designed primarily to promote community welfare into Regulation Y. Such advisory activities had previously been permitted only by Board order. For examples of advisory services approved for community development projects, see 1990 FRB 671, 1989 FRB 576, and 1988 FRB 140.

3150.0.1 INVESTMENTS IN CORPORATIONS OR PROJECTS TO PROMOTE COMMUNITY WELFARE—BOARD INTERPRETATION

The Board also provides guidance with regard to investments in community welfare projects through its interpretation (see section 225.127 of Regulation Y (12 C.F.R. 225.127)). This interpretation describes projects that the Board has considered as promoting community welfare as their primary intent. These include but are not limited to—

1. projects to construct or rehabilitate housing for low- or moderate-income persons,
2. projects for construction or rehabilitation of ancillary local commercial facilities necessary to provide goods or services principally to persons residing in low- or moderate-income housing, and
3. projects designed explicitly to create improved job opportunities for low- or moderate-income groups.

Because the Board believes that bank holding companies should take an active role in the quest for solutions to the nation’s social problems, it has not defined other types of investments designed primarily to promote the community welfare in order to give bank holding companies greater flexibility in developing new and creative approaches to resolving community problems. Accordingly, the Board has maintained the flexibility to determine whether an activity is primarily designed to promote the community welfare. Factors that the Board might consider include whether the activity benefits low- and moderate-income individuals in areas such as housing and employment and the need for specialized community development activities in different localities. The Board will consider a range of different activities, but will probably not approve a proposal that does not in some way either benefit low- or moderate-income individuals or benefit the specialized needs of local communities.

Once a bank holding company has obtained Board approval to engage in community development activities pursuant to Regulation Y, the holding company may, without further System approval, engage either directly or through a subsidiary in certain community development activities, so long as such activities do not exceed 5 percent of the bank holding company’s total consolidated capital stock and surplus.

A bank holding company may invest and provide financing—

1. to a corporation or project or class of corporations or projects that the Board previously has determined is a public welfare project pursuant to paragraph 23 of section 9 of the Federal Reserve Act (12 U.S.C. 338a);
2. to a corporation or project that the Office of the Comptroller of the Currency previously has determined, by order or regulation, is a public welfare investment pursuant to section 5136 of the Revised Statutes (12 U.S.C. 24 (Eleventh));
3. to a community development financial institution (other than a bank or bank holding company) pursuant to section 103(5) of the Community Development Banking and Financial Institutions Act of 1994 (12 U.S.C. 4702(5));
4. for the development, rehabilitation, management, sale, and rental of residential property if a majority of the units will be occupied by low- and moderate-income persons or if the property is a ‘‘qualified low-income building’’ as defined in section 42(c)(2) of the Internal Revenue Code (26 U.S.C. 42(c)(2));
5. for the development, rehabilitation, management, sale, and rental of nonresidential real property or other assets located in a low- or moderate-income area provided the property

is used primarily for low- and moderate-income persons;
6. to one or more small businesses located in a low- or moderate-income area to stimulate economic development;
7. for the development of, and to otherwise assist with, job training or placement facilities or to foster programs designed primarily for low- and moderate-income persons;
8. to an entity located in a low- or moderate-income area if that entity creates long-term employment opportunities, a majority of which (based on full-time equivalent positions) will be held by low- and moderate-income persons; and
9. for providing technical assistance, credit counseling, research, and program development assistance to low- and moderate-income persons, small businesses, or nonprofit corporations to help achieve community development.

3150.0.2 EXAMPLES OF BOARD-APPROVED ACTIVITIES DESIGNED TO PROMOTE COMMUNITY WELFARE

With its primary thrust to promote community welfare rather than creating a focus on a collateral effect, economic rehabilitation and development should focus on providing housing, services, or jobs for low- or moderate-income residents or groups. Examples of projects previously approved by the Board include an investment in—

1. an agricultural test farm (testing crops, equipment, alternative farming methods and chemicals, and providing student agricultural research opportunities and financial planning workshops for farmers (see 1990 FRB 671);
2. an entity that provides education to young persons (see 1991 FRB 70) through a nonprofit, tax-exempt bank holding company (educational programs consisted of the American economic system, how to start a business, college financial planning, and career opportunities in banking);
3. the acquisition and redevelopment of a sole medical clinic in a small rural town without public transportation that was located 30 miles from another facility and was needed to attract new physicians to replace those retiring (see 1991 FRB 63); and
4. a limited partnership to develop a nearly vacant office building into a hotel complex within a major city, located adjacent to a public housing project. Commitments included providing training to welfare recipients residing in public housing projects and employing low- and moderate-income individuals at the hotel complex, and donating a portion of the profits to a nonprofit corporation designated to provide low-cost housing, employment, and business opportunities for disadvantaged residents. (See 1996 FRB 679.)

3150.0.3 EXAMPLES OF INVESTMENTS VIEWED AS NOT PROMOTING COMMUNITY WELFARE

The Board has indicated that some investments are not designed primarily to promote community welfare unless there is substantial evidence to the contrary, even though the investment may benefit the community to some extent. Examples include investments to build or rehabilitate high-income housing or commercial, office, or industrial facilities which are not designed explicitly to create job opportunities for low-income persons, even though the investment may benefit the community to some extent. This latter point was made in an order (see 1996 FRB 679) whereby the Board denied an application by a bank holding company to acquire an investment in an industrial development corporation involved in the construction of a shopping and office complex in an urban renewal area. The Board identified the critical issue as whether the project was devised primarily to promote the community welfare or primarily designed as a profit-making venture in which the benefits to the community were merely a collateral effect.

In another case, the Board denied a proposal intended to acquire a company that indirectly acted as a managing general partner of a private development venture. The venture was a large-scale, urban redevelopment initiative, jointly sponsored by government and private entities, that was intended to revitalize a geographic area that was largely abandoned within a working middle-class community. (See 1990 FRB 672.)

3150.0.4 INSPECTION OBJECTIVES

1. To determine that new investments and financing in community development and other corporations and projects are designed primarily to promote community welfare.
2. To determine that previous investments and financings continue to meet the standards

imposed by section 225.28(b)(12) of Regulation Y.

3. To determine that the activity remains within the scope of regulatory approval when such approval involves specific rather than general investments.
4. To determine that advisory and related services for programs designed primarily to promote community welfare are being conducted within the scope of their regulatory approval.

3150.0.5 INSPECTION PROCEDURES

As is standard practice in the examination of other subsidiaries engaged in nonbanking activities, a thorough review of pertinent books, records, contracts, and financial statements should be undertaken by the examiner. To fulfill the inspection objectives concerning this activity, the examiner may have to go beyond routine investigative practices. Since this activity encompasses a wide variety of programs, procedures will have to be developed on an ad hoc basis. When federal or state approval of the program is required, the examiner may wish to review applications and other materials submitted to such authorities. The terms or conditions imposed by such bodies as well as the subsidiary's continued eligibility may also be of importance. Contact with responsible federal or state officials may be deemed appropriate in certain cases. Such contacts, however, should be initiated only in accordance with respective Reserve Bank procedures. When a community welfare project or financing does not include the involvement of another governmental body, the examiner will need to verify directly whether goals essential to the nature of the activity, such as providing housing for the elderly or jobs for low- or moderate-income people, are being met. In this regard, the burden should be on the holding company to provide such data. In some instances, an on-site visit to the project may be appropriate.

3150.0.6 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*

2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

3160.0.1 PROVISION OF DATA PROCESSING AND TRANSMISSION SERVICES

Under section 4(c)(8) of the BHC Act, the permissibility of bank holding company data processing activities is generally predicated upon the type of data processed or transmitted. Subsidiaries formed under this section may engage in business directly with outside customers, unlike section 4(c)(1) subsidiaries, which can act only as servicers for affiliates[1] and cannot deal directly with outside customers.

The intent of section 4(c)(8) is to permit bank holding companies and their nonbank subsidiaries to directly provide to customers financially or economically oriented services (or those that are similar to these services) that banks have traditionally used in their own internal operations and provided to their customers. Such services (with prior approval) are unrestricted as to location and may be provided from out-of-state locations.

3160.0.2 INCIDENTAL ACTIVITIES

The Board regards the following as incidental activities necessary to carrying on permissible data processing activities:

1. Making excess computer time available to anyone as long as the only involvement by the bank holding company system is furnishing the facility and the necessary operating personnel. This stipulation applies when—
   a. the equipment is not purchased solely for the purpose of creating excess capacity to sell;
   b. hardware is not offered in conjunction with excess capacity; and
   c. the facilities for the use of the excess capacity do not include providing any software other than systems software (including language), network communications support, and the operating personnel and documentation necessary for maintaining and using these facilities.
2. Selling byproducts of permissible data processing and data transmission activities where they are not designed, or appreciably enhanced, for the purpose of marketability.
3. Furnishing any data processing service upon request of a customer if the service is not otherwise reasonably available in the relevant market area.

3160.0.3 SECTION 4(c)(8) vs. SECTION 4(c)(1)

Section 4(c)(1) data processing subsidiaries, which do not require prior approval, are limited as follows:

1. They can furnish computer services *only* for the internal operations of the bank holding company and its bank affiliates.[1]
2. Direct computer services to nonaffiliated customers are not permitted. Any contract to furnish services to nonaffiliated customers must be between the affiliate bank and its customer, with the data processing subsidiary acting as a servicer for its affiliate bank. In addition, the kinds of services furnished are limited to those that a bank can normally provide.

Section 4(c)(8) data processing subsidiaries may deal directly with the customer. In accordance with section 4(c)(8) of the BHC Act and section 225.28(b)(14) of Regulation Y, the kinds of services nonbank subsidiaries of bank holding companies may provide to others are—

1. data processing and transmission services, facilities (including hardware, software, documentation, or operating personnel), databases, advice, and access to such services, facilities, or databases by any technological means, if—
   a. the data to be processed or furnished are financial, banking, or economic data and
   b. the hardware provided in connection with the data processing and transmission services is offered only in conjunction with software designed and marketed for the processing and transmission of financial, banking, or economic data, and the general-purpose hardware does not constitute more than 30 percent of the cost of any packaged offering.
2. data processing, data storage, and data transmission services for a third party that are not financial, banking, or economic related if the

1. In this context, ''affiliates'' is limited to other organizations that have subsidiaries of the same parent bank holding company as the servicer.

subsidiary's total annual revenue derived from those activities does not exceed 30 percent (49 percent effective January 8, 2004) of its total annual revenues derived from data processing, data storage, and data transmission activities. See 1993 FRB 1158 and section 3160.2.

3160.0.4 MINI-COMPUTER ACTIVITIES

Some data processing subsidiaries are actively engaged in placing mini-computers with some of their customers. However, if the subsidiary acts as sales agent for the manufacturer and receives a commission, it is in violation of section 225.28(b)(14) of Regulation Y and should be advised to cease the practice.

3160.0.5 HARDWARE AND SOFTWARE AS AN INTEGRATED PACKAGE

Customers of data processing services require that suppliers provide them with hardware and software as an integrated package. Providing general-purpose hardware is permissible only if the cost of the hardware does not exceed 30 percent of the cost of the packaged offering, and only in conjuction with permissible software. When hardware is provided in a specialized form (such as ATMs), its provision meets the *National Courier* test and is closely related to banking and therefore not subject to the 30 percent limitation.

3160.0.6 PACKAGED FINANCIAL SYSTEMS

The Board found that providing packaged financial systems, including data processing hardware and software, to be installed on the premises of the customer is closely related to banking if conducted within the limits of Regulation Y.

3160.0.7 EXCESS CAPACITY

The sale of excess computer time is currently treated in a Board interpretation as a permissible incidental activity. The interpretation (12 C.F.R. 225.123(e)(1)) currently permits a bank holding company to make excess computer time available to anyone so long as the only involvement of the holding company is furnishing the facility and the necessary operating personnel. Data processors that process time-sensitive data must maintain sufficient capacity to meet peak demand and provide backup in case of equipment failure. Excess capacity necessarily results from such needs and thus the sale of excess capacity is necessary to reduce costs and to remain competitive. Bank holding companies are limited in the sale of excess capacity as follows:

1. A bank holding company may not purchase data processing equipment solely for the purpose of creating excess capacity.
2. A bank holding company may not sell hardware in conjunction with excess capacity.
3. A bank holding company may provide only limited types of software in connection with its sale of excess capacity. This includes systems software (that is, software designed only to control and operate the hardware and not to perform substantive operations), network communications support, and the operating personnel and documentation necessary for maintaining and using these facilities.

3160.0.8 BYPRODUCTS

The sale of byproducts for the development of a program for a permissible data processing activity is treated in a Board interpretation (12 C.F.R. 225.123(e)) as a permissible incidental activity. Byproducts may be data, software, or data processing techniques or information developed by the bank holding company. Byproducts *may not* be designed or appreciably enhanced for the purpose of marketability.

3160.0.9 REQUIREMENT OF SEPARATE RECORDKEEPING

The Board's data processing interpretation is designed to minimize any possibility of unfair competition. A bank holding company subsidiary or related entity that provides permissible data processing and data transmission activities (services, facilities, byproducts, or excess capacity) must keep separate books and records and provide the documents to any new or renewal customer upon request.

3160.0.10 SUMMARY

Holding company EDP proposals are evaluated from the standpoint of whether the proposed data processing activities involve banking, financial, or related economic data within the meaning of the Board's Regulation Y. Processing, storing, and transmitting data for third parties, when the data are not financial, banking, or economic, is permissible if the revenues derived from those activities do not exceed 49 percent of the subsidiary's total annual revenues derived from data processing, data storage, and data transmission activities. For examples of previous Board authorizations for data processing and transmission services in accordance with Regulation Y, see sections 3160.1 through 3160.3.

The data processing that is permissible under Regulation Y encompasses various data processing services, including sales analysis, inventory analysis, freight payment, municipal tax billing, credit union accounting, and savings and mortgage company bookkeeping and payroll processing.

3160.0.11 INSPECTION OBJECTIVES

1. To determine that the full range of EDP services performed are permissible financially oriented activities in compliance with applicable laws and regulations.
2. To review the relationship between the data processing subsidiary and its affiliates and the effect of those relationships on the affairs and soundness of the bank affiliate.
3. To determine if operating policies are adequate and if management is operating in conformance with the established policies.
4. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of law or regulation have been noted.

NOTE: All bank-related EDP servicers receive EDP examinations conducted by the primary bank regulator, which cover detailed operations, audit, proper backup, and overall computer operations. The bank holding company–related inspection should focus on the types and permissibility of services performed, the revenue limitations of section 225.28(b)(14) of Regulation Y, the types of customers serviced, and transactions between affiliates, and should provide an overall financial evaluation.

3160.0.12 INSPECTION PROCEDURES

3160.0.12.1 Pre-Inspection

1. Where available, review the EDP examination report in conjunction with the lead bank examination for details of the subsidiary's operations and management.
2. Review correspondence files and the application memo for the history of the subsidiary.

3160.0.12.2 On-Site

1. Have a brief meeting with the chief executive officer of the subsidiary to establish contact and present a brief indication of the scope of the inspection.
2. Ask the controller of the company for the schedules and other information requested in the entry letter.
3. Request the following information and schedules in addition to what was requested in the entry letter:
   a. complete list of the computer applications the subsidiary performs
   b. list of customers
   c. policy and procedure manual, if any
   d. copy of the latest internal and external financial and operational audits and internal control reviews
   e. copy of the types of management reports the subsidiary submits to the parent company and directors
   f. internal management organization chart
   g. copy of the agreement executed with the affiliates concerning the services provided and the fees collected
4. Review the board of directors' minutes and the executive committee's minutes to determine the broad types of operations of the company.
5. Determine the scope of the inspection based on evaluations of—
   a. corporate minutes,
   b. schedules,
   c. accounting records,
   d. internal controls, and
   e. the scope of the work performed by the internal auditor.
6. Review the trial balances and compare them against the respective general ledger control accounts.
7. Where necessary, interview pertinent division heads.
8. Determine if there are adequate management information systems and regular periodic reports made available that provide

sufficient segregated details on the annual revenues earned from (1) financial-, banking-, or econimic-related data processing and data transmission services and (2) third-party nonfinancial data processing and data transmission services. Ascertain whether the information will allow verification of compliance with the revenue limitations found in section 225.28(b)(14) of the Board's Regulation Y.

9. Verify that the subsidiary of the bank holding company is complying with the revenue limitations found in section 225.28(b)(14) of Regulation Y.
10. Review the data processing and transmission services provided to customers for violations of the Board's regulations and interpretations and obtain sufficient documentation for the workpapers.
11. Prepare a statement of condition with a minimum two-year comparison. More than two years may be prepared if the information is available and meaningful.
12. Prepare a statement of income using the same procedures outlined above.
13. Review all significant internal policies. Determine if the policies were developed internally or by the parent company.
14. Review the subsidiary's management reports to the parent company. Is the reporting complete and frequent (at least quarterly)? Is the parent company fully aware of the subsidiary's operations or problems?
15. Review the adequacy of internal and external financial and operational audits and internal control reviews. Interview the EDP auditor and review the audit reports and CPA management letters (for the period of the inspection) and conduct interviews with the auditors, including the EDP auditor (if one was engaged).
16. Review the condition of the company's records, that is, their availability, completeness, and accuracy. Deficiencies should be discussed in detail with recommendations for improvement.
17. Review all intercompany transactions. Be consistently alert for any transactions with affiliate bank(s) that would be a violation of section 23A and section 23B of the Federal Reserve Act and Regulation W.
18. Review significant litigation and other contingent liabilities.

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

A bank holding company applied for the Board's approval to acquire all the shares of a nonbank data processing company to engage in the processing and transmission of certain medical-payment data. The nonbank subsidiary plans to engage in activities that specialize in a range of medical-payment electronic funds transfer services, including the development of software products related to the processing of medical-claims payments.

Basic network services. The Board determined by order that a nonbank subsidiary of a bank holding company may provide a network for the processing and transmission of medical-payment data between health-care providers (such as physicians, hospitals, and pharmacies) and entities responsible for paying medical benefits (such as health insurers, health maintenance organizations, and preferred provider organizations). These nonbanking activities are permissible under the Bank Holding Company Act and the Board's Regulation Y (12 C.F.R. 225.28(b)(14)). The information on the patient's medical-benefits card (made available by paying organizations) would be used to access the system (similar to a debit or credit card). In general, health-care providers would enter claims information into the network with a request for payment, and the payers would authorize electronic fund transfers for full or partial payment of the claims.

The bank holding company's nonbank subsidiary would also process and transmit medical-treatment data necessary for the processing of claims, and would furnish providers with access to a coverage-information database. The database would transmit information about the terms of a particular payer's medical coverage contract, such as the extent to which specific medical treatments are covered by the patient's insurance policy. While such medical and coverage data are not financial data, the processing and transmission of these data are essential to the transmission and processing of the medical payments and financial information in the network. Also, these data processing services allow the electronic transfer of funds. The Board found that the processing and transmission of the medical and coverage data, in connection with the nonbank subsidiary's operation of a payments network, are permissible as incidental activities. The Board further determined that the nonbank subsidiary's operation of a medical-payments network would constitute permissible data processing and data transmission activities under the BHC Act.

Adjudication software. The Board also authorized the bank holding company's nonbank subsidiary to furnish claims-adjudication software to payers. The software is designed for the processing of routine claims and would include the basic rules of a payer's coverage contract. Claims-adjudication processing would involve the interaction of financial and banking data and medical and coverage data as a necessary prelude to electronic funds transfer. The Board found that the processing of medical and coverage data involved in claims adjudication is an integral and necessary part of the processing of related financial and banking information, and the nonbank subsidiary's processing of underlying payment transactions. The Board concluded that the nonbank subsidiary's provision of claims-adjudication software is permissible as an activity incidental to its provision of software for the processing of banking and financial data and to its operation of a medical-payments network.

Electronic data interchange. The bank holding company's nonbank subsidiary also plans to provide medical–payments system participants with statistical and other data derived from the information in its database. Each participant would have on-line access to all of the data it places into the system, and third parties designated by a payer or provider could also receive access to the data owned by that customer. The Board has previously stated that bank holding companies may provide byproducts of permissible data processing and data transmission activities as long as the byproducts are not designed, or appreciably enhanced, for the purpose of marketability (12 C.F.R. 225.123(e)(2)). The Board has also indicated that byproducts include data, software, or data processing techniques that may be applicable to the data processing requirements of other industries.

The nonbank subsidiary may perform limited selection, combination, and similar functions on raw data so that the data can be transmitted to the customer in a reorganized and more usable form. It may also design software that would enable customers to perform similar reorganization functions on raw data. The Board concluded that the proposed electronic data interchange services would constitute permissible byproducts of the nonbank subsidiary's primary data processing activities, and are therefore permissible as an incidental activity.

The Board's approval of the application on December 22, 1993, is based on the facts of record and is subject to the commitments and representations that were made by the applicant and the conditions referred to in the order. (See 1994 FRB 139.)

Four bank holding companies (the applicants) applied for the Board's approval under section 4(c)(8) of the Bank Holding Company Act to engage de novo, through their joint venture corporation (the company), in nonbanking activities consisting of engaging in electronic benefit transfer services, stored-value card services, and electronic data interchange services. The applicants proposed to engage in the activities throughout the United States. The applicants provide data processing and transmission services through the company to retail merchants using point-of-sale (POS) terminals and to banks who are members of the company's automated teller machine (ATM) network.

3160.2.1 ELECTRONIC BENEFIT TRANSFER SERVICES

The electronic benefit transfer services would involve data processing and transmission services required to permit the delivery of governmental program benefits (such as welfare payments and food stamps) through the ATM and POS terminals of participating merchants and banks. Under a benefits services system, a benefit recipient would be issued a magnetically encoded card, similar to an ATM card, which could be used to obtain access to a government benefit account maintained on behalf of the recipient. The Board concluded that such activities are financial activities that are operationally and functionally similar to the electronic payment and data processing services provided by banks and bank holding companies in the operation of ATM and POS networks. In particular, the proposed benefit services involve the processing of access and authorization requests submitted to, and electronic payments originating from, financial accounts on the same basis as transactions initiated with traditional credit and debit cards. The Board thus concluded that such electronic benefit transfer activities are closely related to banking, permissible for bank holding companies under the BHC Act.

3160.2.2 STORED-VALUE CARD SERVICES

Stored-value card services would involve data processing and transmission services and electronic payment services related to stored-value cards. These cards are similar to credit or debit cards in which authorized funds can be transferred and credited using magnetic stripe or computer chip technology. The services would be provided in connection with both ''closed'' and ''open'' stored-value card systems. Closed systems include both single-vendor stored-value card systems and systems designed for single-use sites. An open system, by contrast, refers to multiple-vender, multiple-site stored-value card systems.

3160.2.2.1 Stored-Value Card Closed Systems

In most current closed systems, cash must be deposited in a particular vendor's card-dispensing terminal, and the card received from the terminal may be used only for purchases from that specific vendor. The card itself is disposable, and the only account reconciliation that may be required would involve the vendor's own cash receipts, the amount of funds debited from the cards at turnstiles or other points of sale, and the amount of the vendor's liabilities stored on outstanding cards. The company intended to play a role in the operation of this basic type of closed system, as well as to help develop and operate more complex closed systems. These systems would use a plastic card containing electronic technology, such as a computer chip or magnetic stripe, to which funds could be credited and from which funds could be debited, for an indefinite period of time. The company proposed performing accounting functions in customer accounts and accounting for the level of the vendor's stored liabilities. In such a capacity, the company would be responsible for the settlement and reconciliation of these customer and vendor accounts. The company would also perform other functions, such as embossing and issuing cards and arranging for funds collection.

3160.2.2.2 Stored-Value Card Open Systems

The applicants anticipate that stored-value cards eventually will operate in an open system similar to a POS network, which allows value stored on a card to be used with a wide range of participating vendors. The applicants expect that the company's principal stored-value card activities would involve the development and operation of such open systems.

In an open system, customers' debit cards would hold an integrated computer chip or some type of comparable technology capable of storing value for use in stored-value card transactions. Value could be placed on the card at an ATM adapted to read and place value on the chip, at a limited purpose ATM-type machine whose only functions would be to add value to the chip and to transfer stored value back to the customer's account, or at a cash-to-card machine or other value transfer device (collectively, value terminals). These value terminals would be operated, in at least some cases, by the company. Once value is placed on a card, equivalent funds could be transferred to the company, which would hold the funds for payment of stored-value card transactions. Stored value would leave the chip when the customer purchases goods or services either at a POS terminal (which may be operated by the company) or at a vending machine, telephone booth, mass transit turnstile, or other unmanned delivery location (collectively, reader terminals), or when the customer transfers funds back to an account at a value terminal. Reader terminals generally would be off-line devices, not connected to the company's ATM or POS networks. Instead of a direct electronic connection, a reader terminal would retain, for a period of time, value representing the amount of customer purchases at the terminal. Then, at the vendor's convenience, the company, the vendor, or a third party would collect value from the reader terminals using specially designed collection cards issued by the company. The collection cards would then be submitted to the company so that funds can be properly credited. Once these transactions occur, the company would be responsible for making settlement by transferring funds to the accounts of participating merchants and other appropriate parties.

The Board concluded that the company's activities in providing stored-value card services, in both closed and open systems, are closely related to banking. The activities involve processing debits and credits to the stored-value cards and performing related accounting and settlement functions, and are thus a data processing activity. Financial balances are maintained and adjusted at POS and other terminals as the customer purchases various items or adds value to the card, and the activity constitutes the processing of banking, financial, or economic data within the meaning of Regulation Y. In addition, aspects of the company's stored-value card services are functionally similar to the issuance and sale of consumer payment instruments such as travelers' checks, which are activities that banks conduct and that the Board has previously determined to be closely related to banking within the meaning of the BHC Act. The Board concluded that the company's proposed services in connection with stored-value cards, in either an open system or a closed system, are closely related to banking.

3160.2.3 ELECTRONIC DATA INTERCHANGE SERVICES

The company also proposes to furnish retail merchants with data collected from sales transactions consummated at the merchant's place of business (data services). The data collected and furnished would relate to specific items and quantities of products purchased by the customer, as well as customer purchasing patterns over a period of time. The data would be formatted so that it could be used by the merchant for inventory control, targeted marketing, and other purposes. The company's data services generally would be furnished to merchants as an adjunct to its POS transaction processing services and would be rendered through a retail merchant's POS terminals. The company does not intend to offer data services independently. In addition, the data that are collected by the company would be furnished only to the merchant that is a party to the underlying sales transaction; that is, the company does not intend to provide such information to third parties.

The company's data services would be limited to capturing, formatting, and furnishing data collected from sales transactions consummated at a particular merchant's place of business. In addition, the data collected would be furnished only to that merchant and only in accordance with the merchant's specific instructions. The company does not intend to provide software, render advice, or provide other services associated with the marketing or other uses of the data. The applicants do anticipate, however, that the company could provide additional related functions, such as issuing store coupons or credits related to a merchant's marketing programs at POS terminals. Based on the facts presented, the Board determined that the sales data that would be processed under the proposed data services are financial and economic data within the meaning of Regulation Y.

3160.2.4 BOARD APPROVAL

Based on all the facts of record, the Board approved the applications. The Board's approval is specifically conditioned on compliance with the commitments made in connection with the applications and with the conditions referred to in the order. (See 1993 FRB 1158.)

Regulation Y has been revised to clarify that a bank holding company may render advice to anyone on processing and transmitting banking, financial, and economic data (see 12 C.F.R. 225.28(b)(14)). The following two restrictions on permissible data processing activities have been deleted: (1) All data processing services must be provided pursuant to a written agreement with the third party that describes and limits the services; and (2) data processing facilities must be designed, marketed, and operated for processing and transmitting financial, banking, or economic data. The data processing activity has also been revised to permit bank holding companies to derive up to 30 percent of their data processing revenues from processing and transmitting data that are *not* financial, banking, or economic.

Eleven bank holding companies (the applicants) applied for the Board's approval to engage through a joint venture corporation (the company) in certain nonbanking activities related to the operation of a retail electronic funds transfer network, including data processing and data transmission activities related to automated teller machine (ATM) and point-of-sale (POS) transactions, as well as electronic benefit transfer, stored-value card, and electronic data capture and interchange services. (A complete list of the proposed activities is found at 1994 FRB 1110–1111.)

The applicants also proposed to offer through the company certain data processing and data transmission services not previously considered by the Board. Those services consisted of allowing customers to use their ATM cards at an ATM terminal to withdraw funds from a bank account in the form of travelers' checks or postage stamps. Payment for the transactions would be accomplished by a debit to a cardholder's deposit account.

The transactions would occur at terminals that would not be owned and operated by the company. Cardholders buying postage stamps or travelers' checks at an ATM terminal would purchase those products from the bank owning the ATM. The decision on which travelers' checks to issue would remain with the bank that owns the ATM terminal, and the company would not be the issuer of the travelers' checks.

The company's primary activities would be processing and transmitting access requests and payment authorizations. The company would also provide terminal-driving services, load ATM terminals with postage stamps and travelers' checks, and market the products through the network.

The Board determined that the proposed activities involved the processing of access and authorization requests submitted to deposit accounts on the same basis as other transactions initiated with a traditional debit card. The activity is operationally and functionally similar to the data processing services provided by banks and bank holding companies in their operation of ATM and POS networks. Traditionally, banks have been permissibly engaged in the sale of travelers' checks and postage stamps. The Board thus found the company's proposed data processing and transmission activities, with respect to these transactions, to be closely related to banking. (See 1994 FRB 1107.)

Five bank holding companies (the applicants) applied for the Board's approval to engage, through a joint venture subsidiary (the company), in certain data processing activities pursuant to Regulation Y. The applicants, through the company, would provide data processing and related services to banks and other automated teller machine (ATM) owners in connection with the distribution through ATMs of tickets, gift certificates, prepaid telephone cards, and other documents evidencing a prepayment for goods or services.[1]

The company would provide the software and telecommunications channels necessary to transmit cardholder requests, card-issuer authorizations, and related switching and account reconciliation services. Specifically, the company would provide terminal driving services that include—

- establishing and maintaining an electronic link between an ATM and a telecommunications switch to transmit cardholder requests and card-issuer authorizations; and
- operating the feature and functions displays on an ATM screen using computer software to permit an ATM to dispense various products in addition to currency.

The company would also provide switching services and transaction processing to transmit account debiting, transaction authorization, and settlement data between the ATM owner, or its bank, and the cardholder's bank.

A typical transaction would consist of an ATM cardholder selecting a particular product, such as a concert ticket, from a menu displayed on the ATM screen. The electronic commands transmitted by the company would verify that the deposit account or line of credit designated by the cardholder had sufficient funds to effect the purchase. Following authorization, the ATM would dispense the product and issue a receipt. The card-issuing bank would then debit an amount equal to the cost of the purchase from the cardholder's designated account and transfer the funds to the account of the merchant or ATM owner, using settlement procedures established by the company's ATM network.

The Board previously determined that a bank holding company could provide data processing and related services necessary to permit customers to use an ATM card to debit a deposit account or line of credit at an ATM terminal for cash and credit transactions, and for the purchase of travelers' checks, money orders, and postage stamps. The Board has further determined that a bank holding company may provide data processing services that support the use of credit cards by consumers in the direct purchase of goods and services from a merchant. (See 1995 FRB 492, 1990 FRB 549, and 1985 FRB 113.)

The data processing proposed in this case involves the same type of data processing support as the Board has previously approved for credit card transactions and other more traditional types of ATM transactions. The Board thus concluded that the activities proposed by the applicants are permissible, consisting of data processing and transmission services encompassed within the Board's Regulation Y, and are thus closely related to banking within the meaning of section 4(c)(8) of the Bank Holding Company Act. (See 1996 FRB 848.)

1. The tickets would include public transportation tickets and tickets to entertainment events. Gift certificates and prepaid telephone cards would be issued in fixed denominations for a specific merchant or group of merchants, and they would evidence prepayment of the purchase price of merchandise or services to be selected by the bearer at some time in the future. The ATM owners would also sell products that could be offered for sale directly by a financial institution, such as mutual fund shares or insurance policies, where permitted by applicable law.

3160.5.1 ENGAGE IN TRANSMITTING MONEY IN THE UNITED STATES

A bank holding company gave notice under section 4(c)(8) of the Bank Holding Company Act (BHC Act) (12 U.S.C. 1843(c)(8)) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) to engage de novo through two companies (the companies) in the activity of transmitting money for customers within the United States and its territories (''domestic money transmission services'') to third parties located in foreign countries.[1] The activity was to be conducted at first through a network of approximately 1,200 ''outside representative offices'' located in California, Florida, Illinois, and Texas that are under contract with the companies to provide money transmission services.[2] The bank holding company proposes to engage in the planned activity nationwide. The companies are corporations that currently engage in the business of money transmission to Mexico through representatives in California, Florida, Illinois, and Texas.

Domestic money transmission services would be provided in the following manner: A customer would contact the companies directly by means of a dedicated telephone located in the outside representative office to request that the companies transmit funds to a third party for a fee. The outside representative would collect cash and a fee from the customer, issue a receipt, and deposit funds in an account maintained by the outside representative solely for the purpose of receiving funds in trust to be transmitted to a third party. The outside representative may maintain this account at any bank, including a subsidiary bank, but would have no agreement with any bank to accept deposits on its behalf. Neither the outside representatives nor the companies would be FDIC-insured institutions.

The companies would collect funds deposited in an outside representative's account daily through an automated clearinghouse (ACH) or similar transaction and deposit an amount equal to the amount to be transmitted into an account they maintain at a bank, which may include one of its subsidiary banks, located near the third party receiving the funds. The third party would be notified that money is available at a local disbursement site, which could include a bank subsidiary of the bank holding company or consumer finance office or an unaffiliated check-cashing, finance, or other type of office. Funds would be made available to the third party by a check drawn on the companies' account almost immediately after the transmission order is placed by the customer.[3]

A customer would not transmit funds to any bank account maintained by the customer or any third party. Thus, the bank holding company would not use this service to collect deposits for customers of its subsidiary banks or any other bank.

There was no agreement between a customer and a bank to accept money in an account for use by the bank in connection with the proposed domestic money transmission services. The companies and their outside representative would accept money from a customer for the sole purpose of transmitting funds to a third party. A customer would not give funds to the companies with the expectation that the companies would permit the customer to reclaim the funds on demand or after a period of time. Moreover, the companies would not maintain balances or pay interest on the money they receive, and they would only hold funds long enough to transmit them to the designated third party.[4]

The Board previously determined that money transmission abroad is closely related to banking.[5] The Office of the Comptroller of the Currency (OCC) also has concluded that it is permissible for a national bank to accept money from nonbank affiliates for the purpose of transmitting the funds to a foreign country and that a

1. The Board previously approved the bank holding company's acquisition of a company to engage in the activity of transmitting funds to third parties in Mexico by using an unaffiliated foreign bank to make the cash payments. See 1995 FRB 974.

2. Outside representative offices would be expanded to include consumer finance offices in addition to existing grocery stores, travel agencies, pharmacies, and insurance agencies.

3. The domestic money transmission services do not involve lending money because only funds provided by the customer would be transmitted to a third party. The plan does not involve the paying of checks. Although the third party receives money by means of a check drawn on an account maintained by the companies, the receipt of funds in check form is not the payment of a check (see *Independent Bankers Ass'n of America v. Smith*, 534 F.2d 921, 943–45 (D.C. Cir. 1976)).

4. Many states permit companies that are not chartered as banks to transmit money without deeming this activity to involve the taking of deposits. The bank holding company is required to conduct the proposed activities in compliance with licensing and other requirements of relevant state law.

5. See 1990 FRB 270.

nonbank affiliate that participates with the national bank in transmitting money abroad would not become a branch of the bank.[6] Based on all the facts of record and for the reasons discussed in this and the Board's previous orders, the Board concludes that domestic money transmission services are closely related to banking. The Board has relied on the fact that the companies are subject to licensing and examination by state authorities.[7] The companies have committed to comply with all applicable reporting requirements, including reporting all transactions over $10,000 to the Internal Revenue Service. The bank holding company committed to apply the internal controls currently in place at the financial services company to ensure compliance with the Bank Secrecy Act.[8]

Based on the foregoing and all the facts of record, the Board approved the notice on October 17, 1995 (see 1995 FRB 1130). The Board's decision was specifically conditioned on the bank holding company's complying with all the commitments made in connection with the notice and obtaining all necessary approvals from state regulators.

6. The OCC has reasoned that nonbank offices that transmit funds through a national bank to a third party do not constitute ''branches'' under federal law.

7. This order was specifically conditioned on requiring the bank holding company to obtain all necessary state licenses.

8. These procedures include a weekly review of all transactions over $10,000. In addition, the companies will require customer identification, including the customer's current address and occupation, for all transmissions above $3,000. The companies also will run a computer match of all remitters and recipients by name and Social Security number so that reporting requirements cannot be evaded by means of a series of transactions.

Support Services—Printing and Selling MICR-encoded items Section 3165.1

The Board has included within Regulation Y (section 225.28(b)(10)(ii)(B)) the authority for bank holding companies to engage in the printing and selling of magnetic ink character recognition (MICR)-encoded items as part of support services. This activity includes this primary activity and also the printing and selling of corporate image checks, cash tickets, voucher checks, deposit slips, savings withdrawal packages, and other forms that require MICR encoding. The activity was initially authorized as a permissible activity by Board order, whereby such documents were to be printed for and sold exclusively to depository institutions. The applicant associated with that Board order proposed to acquire a controlling interest in a printing company that prints and sells checks and related documents. It planned to engage in a joint venture with another company that engages in check printing and other printing activities. The Board concluded for that application that checks and other MICR-encoded documents used in the payments process are provided in specialized form and that they are an integral part of a fundamental banking service, and thus the activity is deemed closely related to banking. See 1986 FRB 794. The Board included the nonbanking activity in the Regulation Y ‘‘laundry list,’’ effective April 1997.

3170.0.1 INSURANCE ACTIVITIES PERMISSIBLE FOR BANK HOLDING COMPANIES

Before the enactment of the 1970 amendments to the Bank Holding Company Act, the Board by order authorized certain bank holding companies to engage in insurance activities. The specific type of permissible insurance activity for each bank holding company was described in its Board order. These few bank holding-companies that commenced insurance agency activities before January 1, 1971, have grandfather rights under the current statutes and regulations (section 4(c)(8)), exemption G and 12 (CFR 225.28(b)(11)(vii)). These bank holding companies may, with the prior approval of the Board, engage in general insurance agency activities without restriction as to location or to type of insurance sold. (See section 3170.0.3.7)

The 1970 amendments to the Bank Holding Company Act authorized the Board to determine permissible nonbanking activities under section 4(c)(8). Subsequently, on September 1, 1971, the Board amended Regulation Y to permit bank holding companies to engage in certain insurance agency activities.

The Board further amended the section of Regulation Y concerning permissible insurance agency activities on September 1, 1981. The 1981 amendments limited permissible insurance activities previously authorized by Regulation Y. The first amendment deleted from the Board's regulations the authority for bank holding companies to act under section 4(c)(8) of the Bank Holding Company as agent for the sale of insurance for themselves and their subsidiaries. This amendment reflected a court decision of the United States Court of Appeals for the Fifth Circuit that acting as agent for the sale of insurance for the bank holding company and its nonbanking subsidiaries was impermissible (permissible for banks, however). Such insurance is permissible, however, if conducted pursuant to section 4(c)(1)(C) of the BHC Act.[1] The second 1981 amendment deleted from the Board's regulations the authority to act as agent for insurance sold as a matter of convenience to the public. The opinion also found that the part of the Board's regulation relating to the sale of ''convenience insurance''[2] exceeded the scope of the provisions of section 4(c)(8) of the Bank Holding Company Act. The sale of this other insurance was considered impermissible.

On October 15, 1982, Congress enacted the Garn–St Germain Depository Institutions Act (Public Law 97-320). Title VI of that act amended section 4(c)(8) of the Bank Holding Company Act. This amendment stated that insurance agency, brokerage, and underwriting activities are *not* ''closely related'' to banking within the meaning of section 4(c)(8) of the Bank Holding Company Act. However, the amendment provided for seven exceptions to the general prohibition of bank holding companies engaging in insurance activities. One of the seven exceptions contains grandfather exemptions for insurance agency activities conducted on May 1, 1982, or for those insurance activities approved by the Board on or before May 1, 1982. As a result, bank holding companies receiving Board approval on or before May 1, 1982, may continue to engage in their insurance agency activities. (See section 3170.0.3.4)

The seven types of insurance activities allowed as permissible for bank holding companies are as follows:

1. Acting as agent, broker, or principal (i.e., underwriter) for credit-related life, accident and health, or unemployment insurance.
2. For bank holding company finance subsidiaries, acting as agent or broker for credit-related property insurance in connection with loans not exceeding $10,000 ($25,000 in the case of a mobile home loan) made by finance company subsidiaries of bank holding companies. (The Board interpreted this provision as permitting only the sale of insurance that does not exceed the outstanding balance of the loan—vendor's single interest insurance rather than general property insurance that covers the borrower's equity interest.)

1. The Board's Regulation Y was amended as of December 1983 to include the sale of insurance for a holding company based on the services provision of section 4(c)(1)(C) of the BHC Act, which did not require any prior Board approval. Included in the regulation were the services of selling, purchasing, or underwriting such insurance as blanket bond insurance, group insurance for employees, and property and casualty insurance for the bank holding company or its subsidiaries.

2. ''Convenience insurance'' consisted of insurance that was sold as a matter of convenience to the purchaser. The premium income from the sale of this insurance was expected to constitute less than 5 percent of the aggregate insurance premium income of the holding company. The sale of this insurance was not designed to permit entry into the general insurance-agency business.

3. Acting as agent for the sale of any type of insurance in a place with a population not exceeding 5,000, or with insurance agency facilities that the bank holding company demonstrates to be inadequate.
4. Any insurance agency activity engaged in by a bank holding company or its subsidiaries on May 1, 1982 (or approved as of May 1, 1982), including (i) insurance sales at new locations of the same bank holding company or subsidiaries in the state of the bank holding company's principal place of business or adjacent states or any state or states in which insurance activities were conducted by the bank holding company or any of its subsidiaries on May 1, 1982, or, (ii) insurance coverage functionally equivalent to those engaged in or approved by the Board as of May 1, 1982.
5. Acting, on behalf of insurance underwriters, as supervisor of retail agents who sell fidelity insurance and property and casualty insurance on holding company assets or group insurance for the employees of a bank holding company or its subsidiaries.
6. Any insurance agency activities engaged in by a bank holding company having total consolidated assets of $50,000,000 or less. Life insurance and annuities sold under this provision, however, must be authorized by (1), (2), or (3) above.
7. Any insurance agency activity that is performed by a registered bank holding company, which was engaged in some insurance activity before January 1, 1971, pursuant to the approval of the Board.

These seven types of insurance allowed by the amendment to section 4(c)(8) of the Garn–St Germain Act are generally consistent with the types of insurance activities previously authorized by the Board. The one general exception related to the prohibition of the sale of property and casualty insurance.

3170.0.2 INSURANCE AGENCY ACTIVITIES

Insurance agency activities are among the most widely practiced nonbank activities engaged in by bank holding companies. Many bank holding companies are involved in the sale of insurance at some level in the organization; however, the inspection focuses on these activities only when performed by the parent company or by a nonbank subsidiary (excluding bank-owned subsidiaries). Many of the smaller bank holding companies engage directly in these activities rather than through insurance agency subsidiaries. In either arrangement, however, sales are usually conducted on the premises of the subsidiary bank by personnel who most often serve as officers or employees of the bank or parent company.

Performance of insurance agency activities has been profitable for most bank holding companies with many of the smaller companies relying heavily on the commissions generated to service acquisition or other related indebtedness. In most cases, little or no expenditures for fixed assets are required since the premises of the subsidiary banks or parent company are utilized. Likewise, little or no liabilities are incurred since there are minimal assets to be financed.

3170.0.3 PERMISSIBLE TYPES OF COVERAGE INCLUDING GRANDFATHER PRIVILEGES

As noted above, the Board, effective November 7, 1986, approved a revision of specific insurance agency and underwriting activities permissible for bank holding companies under section 4(c)(8) of the BHC Act (section 225.28(b)(11) of Regulation Y). In clarifying the scope of insurance activities that are closely related to banking and permissible for bank holding companies under the Garn–St Germain Act, the Board included in its revised Regulation Y the seven specific exemptions contained in that statute.

3170.0.3.1 Insurance Activities Permissible for Bank Holding Companies per Section 225.28(b)(11)(i) of the Board's Regulation Y

Permissible insurance agency activities include the sale of life, accident and health, and involuntary unemployment insurance that is directly related to an extension of credit by a bank holding company with respect to its own extensions of credit and those of its subsidiaries. For the purpose of determining what activities are permissible, the Board interpreted the term ''extension of credit'' to include direct loans to borrowers, loans purchased from other lenders, and leases of real or personal property so long as the leases meet all the criteria contained in section 225.28(b)(3) of Regulation Y, which defines leases as the functional equivalent of an extension of credit. (See the discussion of leasing in section 3140.0.)

The regulation requires that insurance coverage be limited to the ''outstanding balance due'' on an extension of credit. The ''outstanding balance due'' is calculated as follows:

1. Include:
    a. principal and interest
    b. reasonable administrative fees outstanding on the loan
    c. the balance of payments due in a lease transaction
2. Exclude:
    a. the residual value of the leased item (since the lessor owns the leased item and the lessee is not obligated to purchase the item by paying the residual value)

The insurance may provide for total repayment of the extension of credit in the event of the death of the borrower or for periodic payments on the extension of credit when the borrower is temporarily disabled or unemployed. Such single or periodic payments may not exceed the balance on the loan and thus provide for additional general life or accident coverage.

While ordinarily such credit-related insurance coverage would be declining term as payments reduce the balance due on an extension of credit (loans in connection with first mortgages), a bank holding company may write or sell a level term policy on nonamortizing loans. Policies written or sold pursuant to this paragraph, moreover, may be individual rather than group policies, and the premiums on such policies may be age-related. The Board continues to require that insurance policies sold or written to cover the ''outstanding balance due'' insure only named borrowers or lessees of a particular bank holding company. Accordingly, such policies could cover both spouses jointly only if both spouses were actual borrowers or lessees under the terms of the agreement with the bank holding company.

The Board permits, with regard to an extension of credit, the sale and underwriting of credit-related life, accident and health, and involuntary unemployment insurance (1) with respect to lease transactions, as previously discussed, when such lease transactions are the equivalent of loans; (2) in connection with loans secured by residential first mortgages; and (3) in connection with the servicing of loans originated or purchased by the applicant bank holding company and subsequently sold.

The regulation explicitly permits the sale of life, disability, and involuntary unemployment insurance with respect to a lease transaction, provided the lease is the type of nonoperating, full payout lease described as permissible for bank holding companies in section 225.28(b)(3) of Regulation Y. The Board has determined that such leases are the ''functional equivalent of an extension of credit.'' It believes that this type of lease is encompassed in the term ''extension of credit'' as it is used in exemption A of the Garn–St Germain Act.

As discussed previously, the first exemption of the Garn–St Germain Act permits the sale of any type of life, disability, and involuntary unemployment insurance relating to an extension of credit, including home mortgage redemption insurance. Home mortgage insurance insures the repayment of the unpaid balance of a residential first mortgage loan in the event of the death or disability of the mortgagor. The Board has determined that home mortgage redemption insurance is closely related to banking because it supports the lending function (1986 FRB 339 and 671) by providing for repayment of residential mortgage loans at a time when the death or disability of the borrower may delay or disrupt the scheduled repayment of such loans. Home mortgage redemption insurance in connection with residential mortgage loans is considered as fulfilling the same function as credit life and credit accident and health insurance with respect to other types of loans. The Board recognized that such insurance functions as credit insurance in supporting a bank's lending function (see the Board's approval for the *sale* of such insurance by bank holding companies within 1975 FRB 45).

In approving the activity of home mortgage redemption insurance by order, the Board previously relied on commitments by applicants to inform, in writing, borrowers who are prospective purchasers of such insurance that home mortgage redemption insurance is not required and that, if desired, it may be purchased from other sources. The Board has also relied on a commitment for written notice to borrowers that the insurance contract may be rescinded at any time after the loan commitment is made and before closing. The Board continues to require that such notices be provided to borrowers. In addition, the Board continues to rely on the fact that premiums for such insurance are payable periodically during the term of the extension of credit, so as to increase the borrowers' ability to rescind the insurance and to limit premium financing as an incentive to sell such insurance.

The Board considers an ‘‘extension of credit’’ as covering loans that are made or purchased by the bank holding company or its subsidiaries. Credit-related insurance may be continued on the loans that were sold, and are now only being serviced, provided that they were made or purchased by the bank holding company or its subsidiaries. The Board permits bank holding companies to sell credit-related life, accident and health, and involuntary unemployment insurance where the bank holding company previously placed funds at risk. In this situation, the bank holding company must continue to limit its insurance coverage to the outstanding balance due on the extension of credit by the borrower.

A bank holding company may not sell or underwrite insurance when merely servicing a loan and *it has never placed its funds at risk* either by originating or purchasing the loan; the bank holding company is permitted to collect and transmit insurance premiums, act as intermediary in renewing existing policies or adjusting coverages, and engage in other activities which are incidental to the servicing of loans. The bank holding company may collect a fee for such services, providing that the fee is based on the provision of the service and is not a premium for insurance sold. In that case, the bank holding company would be engaging in loan servicing rather than insurance activities.

3170.0.3.2 Section 225.28(b)(11)(ii) of Regulation Y—Sale of Credit-Related Property Insurance by Finance Company Subsidiaries of a BHC

The Garn–St Germain Act restricts the authority of bank holding companies to engage in property and casualty insurance activities. Before 1982, the Board approved the sale of property and casualty insurance that was directly related to an extension of credit by a bank or bank-related firm in the bank holding company system. The sale of property insurance is now limited to an extension of credit made by a finance company that is a subsidiary of a bank holding company, acting as agent or broker. A finance company subsidiary may only engage in the sale of such property insurance if—

1. the insurance is limited to assuring repayment of the outstanding balance on such extension of credit in the event of loss or damage to any property used as collateral for the extension of credit;
2. the extension of credit is not more than $10,000, or $25,000 if it is to finance the purchase of a residential manufactured home[3] and the credit is secured by the home; and
3. the applicant commits to notify borrowers in writing that—
   a. they are not required to purchase such insurance from the applicant;
   b. such insurance does not insure any interest of the borrower in the collateral; and
   c. the applicant will accept more comprehensive property insurance in place of such single interest insurance.

3170.0.3.2.1 Definition of a Finance Company

A ‘‘finance company’’ for purposes of the sale of property insurance includes all non-deposit-taking financial institutions that engage in a significant degree of consumer lending (excluding lending secured by first mortgages) and all financial institutions specifically defined by individual states as finance companies that engage in a significant degree of consumer lending. Finance companies, under this provision, include those entities that may be authorized to accept limited types of time or savings deposits under state law but which a state has defined to be a finance company. Since exemption B of the Garn–St Germain Act is directed to consumer loans, the regulation requires that a qualifying company be engaged in that type of lending to a significant degree as measured by either number of loans, percentage of loans, percentage of loan amounts outstanding, or some similar measure. The Board will evaluate the amount of the consumer lending on a case-by-case basis.

3170.0.3.2.2 Property Insurance a Finance Company May Sell

Section 225.28(b)(11)(ii) of Regulation Y permits finance company subsidiaries of bank holding companies to engage in the sale of single-interest property insurance that insures against damage or loss only to the extent of the lender’s interest in the property that serves as collateral-for a loan. The Garn–St Germain Act limits the permissible insurance coverage to ‘‘the out-

3. These limitations increase at the end of each year, beginning with 1982, by the percentage increase in the Consumer Price Index for Urban Wage Earners and Clerical Workers published by the Bureau of Labor Statistics.

standing balance due on an extension of credit.'' It does not contemplate general property insurance that covers the entire value of the property, including the balance due the lender and the equity interest of the borrower/owner. Generally such insurance is declining balance and the only interest in the collateral property that may be insured is that of the lender.

The sale of single-interest insurance is permitted provided that the BHC finance company subsidiary does not require such insurance of borrowers who have adequate property insurance on the loan collateral. In addition, the finance company subsidiary is required to disclose in writing that such insurance, if required, need not be purchased from the lender and that such insurance does not cover the borrower's interest in the property. The requirement is also imposed by the Board's Regulation Z, section 226.4(d)(2), if the premium is excluded from the finance charge.

3170.0.3.3 Section 225.28(b)(11)(iii) of Regulation Y—Insurance in Small Towns

Engaging in any insurance activity is permitted in a place where the bank holding company or a subsidiary of the bank holding company has a lending office in a community that—

1. has a population not exceeding 5,000 (as shown by the last preceding decennial census) or
2. has inadequate insurance-agency facilities, as determined by the Board, after notice and opportunity for hearing.

In order to provide insurance agency activities in a town with a population not exceeding 5,000, or in a community that has inadequate insurance agency facilities, the bank holding company must have a lending office that serves the public in the small town. The regulation specifically requires that the office be a lending office in order to provide the bank holding company with a link to the town, to avoid remote operation from a central location of a network of small-town insurance agencies, and generally to maintain insurance as a fee-generating activity to help sustain a small-town lending office as an independent, viable profit center.

The *current* requirement does not limit the sale of insurance to a ''principal place of banking business'' located in a community not exceeding a population of 5,000. Also, a bank holding company insurance agency is not precluded from selling insurance to those residing outside the community who initiate the transaction at the agency's place of business in the town of less than 5,000. Advertising in the community newspaper or a telephone book that may serve an area larger than the community of 5,000 is also not prohibited. The current regulation requires that the bank holding company or a subsidiary thereof establish or have a lending office in the community that has a population not exceeding 5,000.

3170.0.3.4 Section 225.28(b)(11)(iv) of Regulation Y—Insurance Agency Activities Conducted on May 1, 1982

This provision of the regulation includes engaging in any specific insurance agency activity[4] if the bank holding company, or subsidiary conducting the specific insurance agency activity, conducted the insurance agency activity on May 1, 1982, or received Board approval to conduct the insurance agency activity on or before May 1, 1982. Activities engaged in on May 1, 1982, include activities carried on subsequently as the result of an application to engage in such activities pending before the Board on May 1, 1982, and approved subsequently by the Board or as the result of an acquisition by such company pursuant to a binding written contract entered into on or before May 1, 1982, of another company engaged in such activities at the time of the acquisition.

A bank holding company or subsidiary engaging in a specific insurance-agency activity under section 225.28(b)(11)(iv) of Regulation Y may—

1. engage in such specific insurance-agency activity only at locations—
    a. in the state in which the bank holding company has its principal place of business (as defined in 12 U.S.C. 1842(d));
    b. in any state or states immediately adjacent to such state; and
    c. in any state in which the specific insurance-agency activity was conducted (or was

4. Nothing in paragraph (iv) precludes a BHC subsidiary that is authorized to engage in a specific insurance-agency activity under this clause from continuing to engage in the particular activity after merger with an affiliate, if the merger was for legitimate business purposes and prior notice has been provided to the Board.

approved to be conducted) by such bank holding company or subsidiary thereof or by any other subsidiary of such bank holding company on May 1, 1982; and

2. provide other insurance coverages that may become available after May 1, 1982, so long as those coverages insure against the types of risks as (or are otherwise functionally equivalent to) coverages sold or approved to be sold on May 1, 1982, by such bank holding company or subsidiary.

This provision of the regulation parallels exemption D of the Garn–St Germain Act and grandfathers those insurance agency activities in which individual bank holding companies were engaged on May 1, 1982. Under this provision, a bank holding company or subsidiary thereof may continue to engage in particular types of insurance agency activities that were permissible before the passage of the Garn–St Germain Act but which are now prohibited by that act. A qualifying bank holding company may engage, for example, in the sale of property and casualty insurance on property serving as collateral for loans made by a lending subsidiary of the holding company.

A qualifying bank holding company may also engage in grandfathered insurance related to the provision of ‘‘other financial services’’ previously authorized under section 225.28(b)(11)(i)(B) of Regulation Y. This type of insurance is not considered to be related to an extension of credit under the Garn–St Germain Act. As a result, the Board *no longer permits* the sale of insurance related to the provision of the general financial services offered by a bank or bank-related firm. Such insurance included, for example, insurance on the contents of safe deposit boxes, or savings completion insurance on certificates of deposit, Christmas club accounts, individual retirement accounts, tuition completion plans, or credit-related insurance for serviced loans. Prior to the Garn–St Germain Act, insurance related to the provision of general financial services was permitted to be sold to borrowers whose loans were neither purchased nor originated, but may have been serviced by the bank holding company. Insurance with respect to loan servicing was the primary type of insurance previously permitted by the Board as related to such financial services. Now, the Garn–St Germain Act limits the sale of insurance by bank holding companies in general to insurance related to an extension of credit.

3170.0.3.4.1 Limitations on Expansion of Grandfather Rights

Exemption D provides for limited expansion of grandfathered insurance agency activities in order to permit qualifying bank holding companies to remain effective insurance agent competitors. The exemption presented three issues that the Board resolved in paragraph (iv) of the regulation: (1) defining which subsidiaries of a bank holding company may engage in otherwise impermissible insurance agency activities under exemption D; (2) the scope of permissible geographic expansion; and (3) the scope of product-line expansion.

Specific Subsidiaries That May Engage in Grandfathered Activities

Grandfather rights do not inure to the benefit of the entire holding company system by virtue of the fact that a particular subsidiary was engaged in insurance agency activities before May 1, 1982. Only the subsidiary of the bank holding company that was engaged in insurance activities on May 1, 1982, or received Board approval to engage in insurance activities before May 1, 1982, has grandfather status.

The Board believes that the emphasis in the legislative history on the transfer of grandfather rights shows the intent of Congress to prohibit not only the transfer of such rights from ‘‘grandfathered’’ subsidiaries to those affiliates wholly without grandfather rights, but also to prohibit the transfer of grandfather rights with respect to particular kinds of insurance from one ‘‘grandfathered’’ subsidiary to another. Thus, a subsidiary that sold only credit life insurance before the grandfather date should not acquire grandfather rights to sell property and casualty insurance solely because an affiliate sold property and casualty insurance before the grandfather date. The grandfather rights of a particular subsidiary are limited to the precise activities (or their functional equivalent) engaged in before May 1, 1982. This requirement does not preclude the transfer of grandfather rights in the case of a bona fide merger (1983 FRB 554, 555).

Section 225.28(b)(11) of the Board’s Regulation Y is only intended to clarify the exemptions in title VI of the Garn–St Germain Act. It does not authorize any bank holding company to commence any insurance activity, or to acquire a company with insurance activities, without compliance with the notice and application requirements of section 4(c)(8) of the BHC Act.

Geographic Expansion by a Grandfathered Subsidiary of a Bank Holding Company.

The language of exemption D of the Garn–St Germain Act, while limiting the grandfathered activities to those agency activities conducted by the specific grandfathered subsidiary, *does allow* expansion into states where such specific types of agency activities "were conducted by the bank holding company or any of its subsidiaries on May 1, 1982 . . ." If a bank holding company subsidiary is selling a particular type of insurance in a given state, the Board does not believe there is any regulatory or business purpose served by restricting another grandfathered subsidiary from engaging in the same activity in the same location.

Product-Line Expansion

The Board's regulation provides for product-line expansion. A grandfathered subsidiary of a bank holding company may seek approval from the Board to engage in the sale of new types of insurance that protect against the same types of risks as, or are otherwise functionally equivalent to, insurance sold on the grandfather date.

3170.0.3.4.2 Transfer of Grandfather Rights among Subsidiaries

A grandfathered subsidiary of a bank holding company (or its successor) may retain its grandfather rights after merger with an affiliate, if such merger is based on legitimate business concerns, for example, centralized management or increased efficiency, rather than as a means of extending insurance powers. The regulation further provides that bank holding companies must advise the Board before any such merger for legitimate business purposes in order to confirm the transfer of grandfather rights.

3170.0.3.5 Section 225.28(b)(11)(v) of Regulation Y—Bank Holding Company's Insurance Coverage for Internal Operations

The Garn–St Germain Act approved, and the revised Regulation Y included, insurance agency activities where the activities are solely limited to supervising on behalf of insurance underwriters the activities of retail insurance agents who sell—

1. fidelity insurance and property and casualty insurance on the real and personal property used in the operations of the bank holding company or its subsidiaries and
2. group insurance that protects the employees of the bank holding company or any of its subsidiaries.

This provision of Regulation Y is reflective of an intent on the part of Congress to avoid preempting certain practices permissible under Texas law. This insurance relates to a particular situation that may have little applicability elsewhere.

3170.0.3.6 Section 225.28(b)(11)(vi) of Regulation Y—Small Bank Holding Companies

The Board has determined in section 225.28(b)(11)(vi) of its Regulation Y that engaging in any insurance agency activity is permissible if the bank holding company has total consolidated assets of $50 million or less. A bank holding company performing insurance agency activities under this paragraph *may not* engage in the sale of life insurance or annuities except as provided in section 225.28(b)(11)(i) and (iii) of Regulation Y, and it may not continue to engage in insurance agency activities pursuant to that provision more than 90 days after the end of the quarterly reporting period in which total assets of the holding company and its subsidiaries exceed $50 million.

A bank holding company is required to cease general insurance-agency activities pursuant to this provision within 90 days after the end of the quarterly reporting period in which the bank holding company's total assets exceed $50 million. Thereafter, the bank holding company may continue to engage in the sale of insurance pursuant to other exemptions.

3170.0.3.7 Section 225.28(b)(11)(vii) of Regulation Y—Insurance Agency Activities Conducted before 1971

The Board has determined in section 225.28(b)(11)(vii) of its Regulation Y that any insurance agency activity performed at any location in the United States directly or indirectly by a bank holding company that was engaged in insurance agency activities before January 1, 1971, as a consequence of approval by the Board before January 1, 1971, is permissible.

3170.0.3.7.1 Agency Activities

The Board adopted a position in section 225.28(b)(11)(vii) permitting any qualifying bank holding company to engage in general insurance-agency activities without restriction as to location or to type of insurance sold (1985 FRB 171 and 1984 FRB 235, 470). A company qualifies under this provision if it was engaged in insurance agency activities as a consequence of Board approval before January 1, 1971. A very limited number of active bank holding companies received such Board approval in the period from passage of the BHC Act in 1956 until January 1, 1971.

The regulation does not limit the insurance agency activities of a qualifying company by requiring that the company engage only in the sale of such types of insurance as it sold before 1971 from such locations as it conducted insurance agency activities before 1971. The Board's regulation permits the limited number of qualifying companies to engage in general insurance-agency activities pursuant to exemption G regardless of their precise insurance agency activities before 1971 (1985 FRB 171 and 1984 FRB 470).

3170.0.4 INCOME FROM THE SALE OF CREDIT LIFE INSURANCE

3170.0.4.1 Policy Statement on Income from Sale of Credit Life Insurance

Effective May 1, 1981, the Board adopted a policy statement (1981 FRB 431) generally prohibiting employees, officers, directors, or others associated with a state member bank from profiting personally from the sale of life insurance in connection with loans made by the bank. The bank may, however, allow their employees and officers to participate in the income under a bonus or incentive plan not to exceed 5 percent of the recipient's annual salary. Income from the sale of credit-related life insurance should most appropriately be credited to the bank, or alternately to a bank holding company or other affiliate of the bank so long as the bank receives reasonable compensation for its role in selling the insurance. As a general rule, ''reasonable compensation'' means an amount equivalent to at least 20 percent of the affiliate's net income attributable to the bank's credit life insurance sales. (Insurance agency activities engaged in directly by a bank subsidiary are regulated by the chartering authority. However, intercompany transactions should be reviewed by BHC inspection personnel.)

3170.0.4.2 Disposition of Credit Life Insurance Income

The Comptroller of the Currency has issued a regulation dealing with sales of credit life, health, and accident insurance by national banks which prohibits transfer of insurance commissions to an affiliate of the bank unless commission income in proportion to the shares held by the bank's minority shareholders is placed in trust and paid to them periodically. Where the subsidiary bank is wholly owned by a bank holding company, however, the regulation allows the commissions to be credited to the holding company or to its wholly owned subsidiaries (12 C.F.R. 2).

3170.0.5 INSPECTION OBJECTIVES

1. To determine the extent of insurance operations and the overall condition of subsidiaries engaged in insurance agency and underwriting activities.
2. To determine whether the types of insurance sold are in accordance with the provisions of section 225.28(b)(11) of Regulation Y.
3. To determine the impact of the performance of the activities on the parent bank holding company and its subsidiaries.
4. To suggest corrective action when necessary in the areas of policies, procedures, or laws and regulations.

3170.0.6 INSPECTION PROCEDURES

Where the insurance activities are performed through an insurance agency or underwriting subsidiary, perform the following activities:

1. Compare the company's general ledgers with statements prepared for the latest FR Y-6 and the annual report to the state insurance department.

2. Review minutes of the board of directors meetings.
3. Review the activity's compliance with the Board's policy statement on income from the sale of credit life insurance (See section 3170.0.4.1) and the Comptroller of the Currency's regulation dealing with the sales of credit life, health, and accident insurance by national banks (12 C.F.R. 2).
4. Review any agreements, guarantees, or pledges between the subsidiary and its parent holding company or affiliates.

Where the insurance activities are performed through an insurance agency or underwriting subsidiary or directly by the parent company, perform the following procedures:

1. Obtain copies of insurance policies issued to determine that the types and terms of insurance coverage sold are within the scope of those permitted by the Board under section 225.28(b)(11) of Regulation Y.
2. Check for compliance with section 106(b) of the 1970 Amendments to the BHC Act (prohibition against tie-in arrangements).

3180.0.1 INSURANCE UNDERWRITING ACTIVITIES

On December 11, 1972, after consideration of a public hearing held on March 24, 1972, the Board amended Regulation Y to add the activity of underwriting credit life insurance and credit accident and health insurance to the list of activities in which a bank holding company may engage, provided that such insurance is directly related to an extension of credit by the holding company system. Such insurance ensures a bank or bank-related firm of repayment of a credit extension in the event of death or disability while at the same time providing the borrower with financial security in either event. In approving this activity, the Board set forth, in a footnote to Regulation Y, requirements to ensure that performance of the activity would result in demonstrable benefits to the public. The Board stated that applications to engage in underwriting activities would be approved only in cases in which the applicant demonstrates that such approval would benefit the consumer or result in other public benefits and that normally such a showing would be made by a projected reduction in rates charged the public for the insurance or an increase in other public benefits resulting from bank holding company performance of this service.

On October 3, 1986, the Board adopted a revision of the provisions of Regulation Y that deals with permissible insurance agency and underwriting activities for bank holding companies. The general revision of the insurance provisions of Regulation Y combined both the insurance agency and insurance underwriting activities reflects amendments to the Bank Holding Company Act by the Garn–St Germain Depository Institutions Act of 1982. The revision of the provisions relating to insurance underwriting eliminated the rate-reduction requirement that previously applied to those companies engaged in the underwriting of credit life, credit accident and health, and involuntary unemployment insurance. Accordingly, bank holding companies engaging in this activity may charge premiums as permitted by the states.

In order for insurance underwriting (including home mortgage redemption insurance) to be permissible in accordance with section 225.28(b)(11) of the Board's revised Regulation Y, the insurance must—

1. be directly related to an extension of credit[1] by the bank holding company or any of its subsidiaries and
2. be limited to ensuring the repayment of the outstanding principal balance due on the extension of credit in the event of the death, disability, or involuntary unemployment of the debtor.

3180.0.1.1 Insurance Underwriting Activities Permissible for Bank Holding Companies per Section 225.28(b)(11)(i) of the Board's Regulation Y—Credit Insurance

The Board permits the insurance underwriting activities described above as well as the insurance agency activities described in section 3170.0.

In section 225.28(b)(11)(i) of Regulation Y, the Board issued three significant interpretations of the term ''extension of credit'' as contained in the Garn–St Germain Act. It permits the underwriting of credit-related life, accident and health, and involuntary unemployment insurance (1) with respect to lease transactions where such lease transactions are the equivalent of loans (leasing is addressed in section 3140.0), (2) in connection with loans secured by residential first mortgages, and (3) in connection with the servicing of loans originated or purchased by the applicant bank holding company and subsequently sold.

Permissible insurance underwriting requires that the credit insurance must be directly related to an extension of credit by the bank holding company or any of its subsidiaries. An ''extension of credit'' includes direct loans to borrowers, and the lease of real or personal property, and loans purchased from other lenders. The first significant interpretation, noted above, allows the inclusion of leasing personal or real property, provided the lease is a nonoperating and full-payout lease, the insurance ensuring the payment of the remaining lease payments that are due in the event of the death, disability, or involuntary unemployment of the lessee.

1. ''Extension of credit'' includes direct loans to borrowers, loans purchased from other lenders, and leases of real or personal property so long as the leases are nonoperating and full-payout leases.

The interpretation thus defines leases as the functional equivalent of an extension of credit.

The second interpretation in paragraph (i) of the regulation involving the definition of ‘‘extension of credit’’ is the permissibility of underwriting home mortgage insurance, which ensures the repayment of the unpaid balance of a residential first mortgage loan in the event of the death or disability of the mortgagor. Exemption A of the Garn–St Germain Act permits the underwriting of any type of life, disability, and involuntary unemployment insurance related to an extension of credit by a bank holding company as long as the face value of the insurance policy does not exceed the ‘‘outstanding balance due’’ on the extension of credit. The Board continues to require that insurance policies written insure only named borrowers or lessees of a particular bank holding company. Such policies could cover both spouses jointly, but only if both spouses were actual borrowers or lessees under the terms of the agreement with the bank holding company (see 1974 FRB 138).

The Board had previously held that the underwriting of home mortgage insurance is not closely related to banking in part because it is more like general life insurance than credit life insurance and in part because banks have not generally underwritten such insurance (see 1980 FRB 660 and 1982 FRB 318). Recently, however, the Board permitted bank holding companies to underwrite such insurance (see 1986 FRB 339 and 1986 FRB 671). In permitting this activity by order, the Board provided detailed findings that the underwriting of home mortgage redemption insurance is permitted by exemption A of the Garn–St Germain Act, is closely related to banking, and does not present the possibility of such significant adverse effects that it should not be added to the list of activities permissible for bank holding companies. The Board also found that home mortgage insurance supports the lending function. The Board thus believes, for the reasons cited in the above-cited orders, that the underwriting of home mortgage redemption insurance is permissible for bank holding companies.

In approving the underwriting of home mortgage insurance by order, the Board relied on commitments by applicants to inform, in writing, borrowers who are prospective purchasers of such insurance that home mortgage redemption insurance is not required and that, if desired, it may be purchased from other sources. The Board has also relied on a commitment for written notice to borrowers that the insurance contract may be rescinded at any time after the loan commitment is made and before closing. In processing applications to engage in the underwriting of home mortgage redemption insurance pursuant to the current regulation, the Board, and the Reserve Banks acting pursuant to delegated authority, will continue to require that such notices be provided to borrowers. In addition, the Board will continue to rely on the fact that premiums for such insurance are payable periodically during the term of the extension of credit, so as to increase the borrower's ability to rescind the insurance and to limit premium financing as an incentive to sell and underwrite such insurance.

A third significant interpretation of the term ‘‘extension of credit’’ found in exemption A of the Garn–St Germain Act involves the underwriting of insurance in connection with the serviced loans (see section 3170.0.3.1) The Garn–St Germain Act limits bank holding companies in general to insurance related to an extension of credit. The term ‘‘extension of credit’’ is used in exemption A to describe transactions in which the funds of the bank holding company or its subsidiaries have been placed at risk, including direct loans or leases or loans that have been purchased. Loans that are merely being serviced by the bank holding company generally would not be covered by this definition.

The underwriting of insurance on loans being serviced is necessary only when the term of the insurance was originally shorter than that of the loan. The bank holding company that is selling and underwriting insurance on the loan that it originated and is servicing is, in effect, only extending the term of its original insurance policy to be coterminous with the duration of the loan. It is providing insurance that it could have provided previously. A bank holding company may not underwrite insurance in the case where it is merely servicing a loan and it has never placed its funds at risk either by originating or purchasing the loan.

3180.0.2 LIMITED PROPERTY INSURANCE RELATED TO AN EXTENSION OF CREDIT (FINANCE COMPANY SUBSIDIARY OF A BANK HOLDING COMPANY)

The Board's revised regulation does not permit the underwriting of this type of insurance. See section 225.28(b)(11)(ii) of Regulation Y and section 3170.0.3.1 for information on authorized insurance agency activities.

3180.0.3 INSURANCE ACTIVITIES BEFORE 1971

The Board's revised regulation (section 225.28(b)(11)(vii)), as it relates to exemption G of the Garn–St Germain Act, does not authorize underwriting activities for bank holding companies. See section 3170.0.3.7 for information on the respective authorized insurance-agency activities under exemption G.

3180.0.4 UNDERWRITING AS REINSURER

The majority of bank holding company subsidiaries engaged in insurance underwriting are reinsurers rather than direct underwriters. As reinsurer, these companies engage a direct insurer to issue the policies, collect the premiums, pay claims, maintain accounting books and records, prepare federal and state tax returns, and perform other services necessary to conduct the insurance activities. Usually, such reinsurance companies will have executed a reinsurance agreement and a service agreement with the direct underwriter which spell out all services to be performed and set the fees to be paid for such services. The above arrangement involves a minimum of activity by the reinsurer and is probably most often chosen by bank holding companies since it does not place additional burdens on management and precludes hiring actuaries and other professional personnel to manage the insurance company.

There are many ratios or measures used to evaluate the condition of insurance underwriters. The National Association of Insurance Commissioners has developed a system consisting of nine ratios that measure various aspects of life and health insurance companies' financial condition and stability *(The Early Warning System for Life and Health Insurance Companies)*. These tests establish benchmarks which are likely to distinguish between troubled and sound companies. The examiner may wish to compare the subject company's ratios to these benchmarks. When making comparisons, however, the examiner should recognize that one insurer may require a somewhat better ratio than another due to greater underwriting and investment risks. Smaller companies will generally maintain a proportionately larger surplus account since loss experience on a small volume of business tends to fluctuate more widely.

Another possible source of information available to help determine a company's condition is *Best's Insurance Reports*. The report is published annually and provides pertinent financial and historical data for legal reserve life insurance companies operating in the United States and Canada. It assigns a rating for each company in the report. Information presented in the report is taken from annual statements filed with the state insurance departments. It should be noted that reports filed with the insurance departments are prepared using the statutory method of financial accounting and presentation rather than generally accepted accounting principles. Beginning in 1973, insurance companies were required to adhere to generally accepted accounting principles for certification of financial statements (see *Audits of Stock Life Insurance Companies,* American Institute of Certified Public Accountants), however, they continue to report under the statutory method to the state insurance departments. The statutory method is basically a cash-basis accounting presentation which generally depicts a more conservative position. Certain assets are "not admitted" by regulatory authorities in the financial presentation because they are not readily convertible into cash for the payment of claims and expenses.

Policy reserves represent the primary liability portion of underwriters' balance sheets. There are several acceptable methods permitted by state authorities for calculating these reserves. Most of these methods are rather complicated and a description of their calculation is beyond the scope of this manual. However, insurance companies are generally closely regulated by state authorities, which place primary importance on determining the adequacy of the policy reserves. A review of the latest available insurance examination report should give an evaluation of the adequacy of the reserves.

Reinsurance arrangements may distribute the insurance and losses in many different ways between the direct insurer and the reinsurer. An understanding of such arrangements is essential in determining the extent of risk incurred by the company being inspected.

3180.0.5 INSPECTION OBJECTIVES

1. To determine the extent of underwriting activities and the overall condition of subsidiaries engaged in underwriting.
2. To determine whether the activities performed are within the scope of those permitted under section 225.28(b)(11) of Regulation Y.

3. To determine the impact of the underwriting operations on the parent bank holding company and its subsidiaries.
4. To suggest corrective action where necessary in the areas of policies, procedures, or laws and regulations.

3180.0.6 INSPECTION PROCEDURES

Where the insurance underwriting activities are performed through an underwriting subsidiary, perform the following procedures:

1. Compare the company's general ledgers with statements prepared for the latest FR Y-6. (Generally, records are maintained on the statutory accounting basis and are more easily tied to the financial statements in the annual report to the state insurance department).
2. Review minutes of the board of directors meetings.
3. Review the quality and liquidity of the subsidiary company's investments in CDs, stocks, bonds, or other marketable securities.
4. Review intercompany transactions, including balances maintained with or assets purchased from affiliated banks.
5. Review any agreements, guarantees, or pledges between the company and its parent holding company or affiliates.

Where the insurance activities are performed either directly or through an underwriting subsidiary, perform the following procedures:

1. Review copies of any reinsurance and/or service agreements executed with other insurance companies.
2. Review the latest annual report submitted to the state insurance department.
3. Review the latest report of examination prepared by the state insurance department.
4. Check calculation of premium charges by a random sample of policies for adherence to the state rate structure.
5. Obtain copies of insurance policies issued to customers to determine that the types of insurance coverage and terms offered are within the scope of those permitted under section 225.28(b)(11) of Regulation Y.

3180.0.7 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Permissible underwriting activities	12 U.S.C. 1843(c)(A)–(G)	225.28(b)(11)	4–050.1	
Underwriting of permissible credit-related home mortgage insurance				1986 FRB 671, 339
Nonpermissibility of mortgage guarantee insurance				1974 FRB 727
Underwriting of joint credit life insurance			4–337	39 Federal Register 7493 1974 FRB 138

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Courier activities are permissible for bank holding companies if the items being transported by the courier are themselves related to bank operations. Examples of such items are drafts, money orders, travelers' checks, commercial papers, written instruments, and data processing material. Currency and bearer-type negotiable instruments which require more than normal security measures may not be transported by the company.

If the courier company operates under the exemptive provision of section 4(c)(8) of the Bank Holding Company Act, the following restrictions are placed on its operations to ensure competition:

1. The company must be a separate, independent corporate entity.
2. The company must be profit-oriented and not subsidized by the holding company system.
3. Services of the company must be performed on a specific-fee basis with direct payment from the customer. Payment may not be made indirectly such as through maintenance by the customer of deposit balances at an affiliated bank.
4. Upon request, the company must furnish comparable services at comparable rates to firms which compete with banking or data processing subsidiaries of its parent company, unless compliance with the request would be beyond the practical capacity of the company.

The last restriction was intended to prevent use of bank-affiliated courier services for the purpose of gaining an advantage over competitors to whom courier services were not otherwise available.

3190.0.1 INSPECTION OBJECTIVES

1. To determine if the company is operating in compliance with applicable laws and regulations, and ensure that corrective action will be taken, if appropriate.
2. To determine if courier services are provided to competing institutions upon their request if courier services are not otherwise available.

3190.0.2 INSPECTION PROCEDURES

1. Determine whether the company makes known to its customers its minimum rate schedule for services and its general pricing policies.
2. Determine whether the company maintains for a period of two years or more the records of each request for service which it has denied to firms competing with the banking and data processing subsidiaries of its parent company. The reasons for the denial must also be recorded and maintained for a like period.
3. Review income statements of the company to ascertain whether the company is operating profitably, without a subsidy in any manner from any entity within the holding company system. Any operating losses sustained over an extended period of time are inconsistent with continued authority to engage in courier services.
4. Determine whether the materials transported by the company are restricted to those which would normally be exchanged among banks and banking institutions, including audit and accounting media of a banking or financial nature, and other business records or documents used in processing such media.

3190.0.3 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Courier activities of bank holding companies		225.28(b)(10)		1973 *Fed. Reg.* 32136 1975 *Fed. Reg.* 36309
Conditions of entry into courier activities		225.129	4–180	

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

On February 26, 1974, the Board amended Regulation Y to permit bank holding companies to engage in the activity of providing bank management consulting services to nonaffiliated commercial banks. The advisee institution must be a ‘‘bank’’ as that term is defined by section 2(c) of the BHC Act or an operations subsidiary of such an institution. (See 12 C.F.R. 250.141.) Effective April 20, 1982, the Board expanded this activity by permitting holding companies to provide management consulting advice to nonbank depository institutions. When expanding the activity to include management consulting advice to nonbank depository institutions, the Board indicated that the advisory services provided to nonbank institutions should generally be the services that were then being provided to banks.

Effective April 21, 1997, management consulting was expanded in Regulation Y (section 225.28(b)(9) to allow bank holding companies to provide management consulting services regarding financial, economic, accounting, or audit matters to any company on any matter. The total annual revenue derived from third-party management consulting services by a nonbank subsidiary of the bank holding company cannot exceed 30 percent of the subsidiary’s total annual revenues derived from all management consulting activities. The Board continues to view ‘‘management consulting’’ as including, but not limited to, providing analysis or advice as to a firm’s—

1. purchasing operations, such as inventory control, sources of supply, and cost minimization subject to constraints;
2. production operations, such as quality control, work measurement, product methods, scheduling shifts, time and motion studies, and safety standards;
3. market operations, such as market testing, advertising programs, market development, packaging, and brand development;
4. planning operations, such as demand and cost projections, plant location, program planning, corporate acquisitions and mergers, and determination of long-term and short-term goals;
5. personnel operations, such as recruitment, training, incentive programs, employee compensation, and management-personnel relations;
6. internal operations, such as taxes, corporate organization, budgeting systems, budgeting control, evaluation of data processing systems, and efficiency evaluations; and
7. research operations, such as product development, basic research, and product design and innovation.

By interpretation, the Board previously determined that it considers bank management consulting advice to include, but not be limited to, advice concerning (1) bank operations, systems, and procedures; (2) computer operations and mechanization; (3) implementation of electronic funds transfer systems; (4) site planning and evaluation; (5) bank mergers and the establishment of new branches; (6) operation and management of a trust department; (7) international banking and foreign-exchange transactions; (8) purchasing policies and practices; (9) cost analysis, capital adequacy, and planning; (10) auditing; (11) accounting procedures; (12) tax planning; (13) investment advice as authorized in section 225.28(b)(6) of Regulation Y; (14) credit policies and administration, including credit documentation, evaluation, and debt collection; (15) product development, including specialized lending provisions; (16) marketing operations, including research, market development, and advertising programs; (17) personnel operations including recruiting, training, evaluation, and compensation; and (18) security measures and procedures. Providing management consulting advice on compliance with laws and regulations may be accomplished only when these activities are incidental to a primary consulting activity and when such advice would not constitute the rendering of legal advice.

In general, those consulting services which correspondent banks traditionally have provided to their respondents (both bank and nonbank depository institutions) are considered to be included within the scope of Regulation Y as permissible services to be provided by nonbank holding company subsidiaries to nonaffiliated bank and nonbank depository institutions.

3200.0.1 MANAGEMENT CONSULTING LIMITATIONS

Recognizing the potential for conflict-of-interest situations, such as the possibility for anticompetitive cooperative arrangements, improper use of confidential information, and similar abuses that this activity could entail, the Board incorporated in Regulation Y a few restrictions on a bank holding company. With regard to affiliation status, neither the bank holding company nor any of its subsidiaries may own or control directly or indirectly more than 5 percent of the voting securities in the client institution. The prohibition would not apply when the shares were acquired in satisfaction of a debt previously contracted or to shares acquired in a fiduciary capacity without sole discretionary voting authority. A bank holding company may offer consulting advice to a client institution whose shares it holds in a fiduciary capacity with sole discretionary voting rights if said holding company does not hold more than 5 percent of the voting shares of that institution. Bank holding companies are permitted to have common management officials with the client institution to which they provide management consulting services if such interlocks would be permissible under exceptions found in the Board's Regulation L (Management Official Interlocks) that apply to such institutions in need of management or operating expertise (12 C.F.R. 212.4(b)).

Management consulting services may not be provided to a client on a daily or continuing basis except where necessary to instruct the client on how to perform the services for itself. The Board has informed bank holding companies that their management consulting subsidiaries should refrain from entering relationships on a daily or continuing basis even when the client institution may be experiencing financial or managerial difficulties. Particular caution should be exercised when a bank holding company contemplates the subsequent acquisition of the client institution. However, when a bank holding company is attempting to acquire a troubled depository institution, limited management consulting services may be offered via an on-premises bank holding company employee. Nevertheless, the representative should not have the authority to lend or make personnel decisions. Failure to heed these guidelines not only would cause the bank holding company to exceed the permissible bounds of the activity, but also could cause it to acquire control of the client institution that might constitute an acquisition of a subsidiary within the meaning of section 3(a) of the BHC Act. Section 225.31(d)(2)(i) of Regulation Y indicates that a rebuttable presumption of control shall exist when a company enters into an agreement, such as a management contract, with a bank or other company pursuant to which the first company or any of its subsidiaries exercises significant influence over the general management or overall operations of the bank or other companies. Reserve Bank personnel are encouraged to contact the Board's applications section to discuss the restrictions on this activity whenever a BHC proposes to have its personnel assist a troubled or problem institution.

When evaluating a BHC's application to engage in management consulting, it is important to note whether the applicant bank holding company has exhibited the necessary expertise in the operation of its own subsidiaries—and whether this qualifies it to offer advice to others.

3200.0.2 INSPECTION OBJECTIVES

1. To verify that the bank holding company is performing only those types of management consulting services at those locations for which it received prior regulatory approval.
2. To verify that the advice being provided is within the scope of the approval and consistent with the activities of the interpretation (12 C.F.R. 225.131) and section 225.28(b)(9) of Regulation Y.
3. To determine that the bank holding company does not own or control, directly or indirectly, securities of its client depository institutions except for shares acquired as the result of a default on a debt previously contracted or shares held in a fiduciary capacity (within certain limits), provided the holding company does not have sole discretionary authority to vote more than 5 percent of the client's shares. (See 12 C.F.R. 225.131.)
4. To determine that the bank holding company does not control the activities of a client institution by virtue of nonexempt interlocking directors.
5. To determine that services rendered to the client institutions are not being provided on a daily or continuing basis.
6. To determine that disclosure is made to each client of (1) the names of all depository institutions that are affiliates of the consulting company and (2) the names of all existing client institutions located in the same county (or counties) or standard metropolitan statistical area(s) (SMSA) as the client institution.

3200.0.3 INSPECTION PROCEDURES

A thorough review of pertinent records, contracts, lists of clients, and documentation of the services being provided to clients should be undertaken to determine that adequate management information systems and detailed revenue and other reports are available to verify the BHC's compliance with the Board's rule on the revenue limitations in section 225.28(b)(9) of Regulation Y. Determine that services are being provided to the appropriate customer base and within the scope of the Board's approval. Further, the examiner should ascertain the existence of procedures to inform each potential client of the names of all depository and client institutions that are affiliates of the consulting company and of the names of all existing clients located in the same market area as the prospective client.

For management consulting services that do not involve any financial, economic, accounting, and auditing matters, verify that the revenues earned are within the limits permitted by the Board's regulations and interpretations. The basis for any fee structure should be determined to ascertain that the advice is being rendered on an explicit-fee basis, such as an hourly or daily rate. Such fees should not be affected by factors not directly related to the service, such as balances maintained by the client at any subsidiary depository institution of the bank holding company. The extent of the consultant company's involvement in the day-to-day affairs and operation of the client should also be reviewed.

The absence of parent company control, direct or indirect, over the clients of the management consulting subsidiary should be established. The examiner should compare listings of directors and principal officers of the bank holding company, its various affiliates, and the clients with due regard to exempt interlocks. The examiner should determine the extent of ownership or control by the bank holding company and its affiliates of any equity securities in its clients by requesting a listing of all shares owned in outside organizations. Overall conclusions, including recommendations concerning the operation, apparent violations, and any possible control of client institutions and conflicts of interest, should be discussed with parent company management and detailed in the inspection report.

Within Regulation Y (section 225.28(b)(9)(ii)), management consulting and counseling activities include employee benefits consulting services. Employee benefits consulting services include providing consulting services to employee benefit, compensation, and insurance plans, including designing plans, assisting in their implementation of plans, providing administrative services thereto, and developing employee communication programs for such plans. A bank holding company nonbank subsidiary's total annual revenue derived from third-party management consulting services to any customer on any matter (including third-party employee benefits consulting and career counseling services) may not exceed 30 percent of its total annual revenue derived from management consulting activities.

The initial Board orders that were issued to permit employee benefit consulting services are summarized here as historical examples of the nonbanking activity. Commitments made in those Board orders should not be relied upon. Refer only to the provisions within the current Regulation Y, as cited above.

3202.0.1 BOARD ORDERS INVOLVING EMPLOYEE BENEFITS CONSULTING

A bank holding company (the applicant) applied for the Board's approval under section 4(c)(8) of the BHC Act and Regulation Y to acquire 100 percent of the voting shares of a company that provides a full range of services involving employee benefits plans. The services are divided into four basic types of activities:

1. *Plan design.* Designing employee benefit plans, including determining actuarial funding levels and cost estimates.
2. *Plan implementation.* Providing assistance in implementing plans, including assistance in the preparation of plan documents and in the implementation of employee benefit administration systems.
3. *Administrative services.* Providing administrative services with respect to plans, including recordkeeping services, calculating and certifying employment reports and government filings pursuant to ERISA, and providing information to a client's legal counsel in labor relations and negotiations.
4. *Employee communications.* Developing employee communication programs with respect to plans for the benefit of the client.

The applicant represented that all of the proposed activities were included in trust company or financial or investment advisory service activities permissible under Regulation Y. Although certain employee benefits consulting activities (as conducted by the company being acquired, particularly activities involving plan administration) are conducted by trust companies or trust departments of banks in their capacities as trustees or custodians of employee benefit plans and investment managers of plan assets, it was not apparent that the *complete range* of employee benefits consulting services were generally conducted by trust companies or authorized by the Board as permissible trust company activities under Regulation Y.

The Board believed that employee benefits consulting was essentially a financial planning activity involving preparing and conveying financial data to a client, which it had previously determined to be closely related to banking and permissible under Regulation Y in the areas of investment advisory services, data processing services, and courier services. The record did not indicate, however, that employee benefits consulting is wholly encompassed within *any or all* of those activities. The Board, therefore, did not agree with the applicant that *all* of the proposed activities were currently authorized for bank holding companies under existing provisions of Regulation Y.

A review of the four basic types of activities revealed that many of the proposed employee benefits consulting activities either were already specifically engaged in by banks and trust companies, or were functionally related to activities in which banks and trust companies were regularly engaged. The Board recognized, however, that the actuarial aspect of the employee benefits consulting activities is not generally included in trust company or bank activities. Such activities are limited in scope and purpose in that they are conducted primarily as a means to ensure adequate funding of defined benefits plans. In this case, they were performed solely as a means for the applicant to provide a full range of benefits-planning activities for its clients. The acquired company's actuarial services would not be conducted as an independent activity, but only as a necessary and integrally related component of employee benefits consulting.[1]

In *Association of Data Processing Organizations, Inc. v. Board of Governors,* 745 F.2d 277 (D.C. Cir. 1984), the court of appeals held that the Board may permit those activities that are ''a part of'' the overall permissible activity where, as here, ''in both market contemplation and technological reality, the service is a unitary one.'' Based on this ruling, the Board concluded that the applicant's proposed activities are permissible as closely related to banking, and were approved on June 19, 1985 (1985 FRB 656).

Another Board order permitting the provision of employee benefits consulting services, which is slightly different from the order cited above, is found in 1986 FRB 337. See also 1986 FRB 729 and 1987 FRB 158, 681.

1. As part of its acquisition, the bank holding company proposed to assist firms in IRS audits of plans; inform clients of developments in employee benefit programs through newsletters and other correspondence and through participation in seminars, public programs, and other forums; and engage in professional actuarial activities and other activities incidental to the actuarial profession. The activities are generally related to the type of actuarial activities performed for purposes of engaging in employee benefits consulting and that would not generate any significant income. Such activities were, therefore, permissible as incidental to the bank holding company's approved activities. The applicant also proposed to provide expert actuarial opinions of a general nature for purposes such as divorce actions and personal injury litigation. The Board believed that such activities were beyond the scope of incidental activities and were not permissible.

Career counseling services may be provided to—

1. a financial organization[1] and individuals currently employed by, or recently displaced from, a financial organization;
2. individuals who are seeking employment at a financial organization; and
3. individuals who are currently employed in or who seek positions in the finance, accounting, and audit departments of any company.

The initial Board order that was issued to permit the provision of career counseling services is summarized below as a historical example on the origination of this nonbanking activity. Commitments made in the Board order should not be relied upon. See the current provisions of Regulation Y (section 225.28(b)(9)(iii)) for that purpose.

3204.0.1 CAREER COUNSELING—INITIAL BOARD ORDER

A bank holding company (the applicant) applied for the Board's approval under section 4(c)(8) of the BHC Act and the Board's Regulation Y to provide career counseling services to unaffiliated parties through its wholly owned nonbank subsidiary. The applicant proposed to expand its employee benefits consulting services to include career counseling activities. The nonbank subsidiary currently provides these services to the applicant and its affiliates under section 4(c)(1)(C) of the BHC Act. It plans to expand the provision of these services nationwide to unaffiliated companies and individuals in a wide array of industries. The services would provide assistance to individuals who are employed and seeking advancement in their careers and to unemployed individuals who are seeking new employment. The nonbank subsidiary plans to provide these services directly to companies and advise these companies on effective methods of providing career counseling services to their employees.

The nonbank subsidiary will advise unaffiliated organizations on the advantages of including career counseling services as part of a comprehensive employee benefits plan. It will assist these organizations in establishing their own facilities to implement career counseling services for their current or former employees. If the organization does not want to operate its own counseling facility, the nonbank subsidiary will provide the services directly to the organization's current or former employees at the nonbank subsidiary's career assistance center.

The proposed career counseling services include (1) assessing an individual's education, prior business experience, salary history, interests, and skills to aid in finding employment or evaluating opportunities for career development; (2) assisting in the preparation of résumés and cover letters; (3) contacting employers regarding employment opportunities and making this information available to clients; (4) conducting general workshops on the financial aspects of unemployment, current economic trends, the process of finding a job, and alternative career options; and (5) providing individual counseling on setting and obtaining employment goals.

The issue presented to the Board was whether the proposed activities are closely related to banking. The Board had not previously determined whether providing career counseling services to unaffiliated parties is closely related to banking under section 4 of the BHC Act and permissible for bank holding companies. The Board viewed the applicant's proposal in four parts: (1) career counseling services for financial organizations (that is, banks, bank holding companies and their subsidiaries, thrift institutions, and thrift holding companies and their subsidiaries) and employees of financial organizations; (2) career counseling services for individuals who are unemployed or employed outside the banking industry and who seek employment at banks and other financial institutions; (3) career counseling for individuals seeking financial positions (such as chief financial officer, cash management positions, and accounting and auditing personnel); and (4) career counseling services generally for any individual seeking any type of employment at any type of company.

The Board determined that career counseling services are closely related to banking when they are provided for (1) financial organizations and individuals currently employed at, or recently displaced from, a financial organization; (2) individuals who seek employment at a financial organization; and (3) individuals who

1. Financial organization means insured depository institution holding companies and their subsidiaries, other than nonbanking affiliates of diversified savings and loan holding companies that engage in activities not permissible under section 4 (c)(8) of the BHC Act.

are currently employed in, or who seek, financially related positions at any company. The Board concluded that the record does not presently support a finding that general career counseling services are otherwise closely related to banking.[2]

The applicant will provide career counseling services on a fee basis with no guarantee of employment. The Board approved the order on November 8, 1993. As a condition to its approval, the applicant must comply with all commitments made in connection with the application, as well as with other conditions stated within Regulation Y and the Board's order. (1994 FRB 51)

2. When providing career counseling for an individual within one of the three proposed categories, the applicant was permitted to provide limited career counseling services regarding positions outside of these categories as ''incidental'' to the proposed career counseling services. However, the applicant is not permitted to hold itself out as a provider of general career counseling services for individuals seeking career opportunities outside the banking or financial industries. Regulation Y and judicial decisions construe ''incidental activities'' as activities that must be necessary to the provision of a closely related activity in order to be considered incidental. (See 12 C.F.R. 225.21(a)(2) and *National Courier Association v. Board of Governors*, 516 F.2d 1229, 1240–41 (D.C. Cir. 1975).)

The Board has included in Regulation Y (see section 225.28(b)(13)) the authority to issue and sell at retail money orders and similar consumer-type payment instruments; the sale of U.S. savings bonds; and the issuance and sale of travelers' checks. Previously, the Board, through various orders, had authorized over time various nonbanking activities in this regard. Initially, it permitted by order and then the Board had included in the list of permissible activities the sale and issuance at retail of money orders having a face value of not more than $1,000, the sale of U.S. savings bonds, and the issuance and sale of travelers' checks. In its original order, effective February 26, 1979, the Board did not include the issuance of travelers' checks. However, after overwhelmingly favorable responses to its proposal to include the issuance of travelers' checks to the list of permissible activities, the Board included this activity effective December 21, 1981. As part of the Board's regulatory review of Regulation Y, and its subsequent overhaul, which was finalized and made effective February 4, 1984, the *issuance* of money orders was listed as a permissible activity. On March 16, 1984, the Board, by order, increased the face value of the payment instruments that the bank holding company could issue to $10,000, if the bank holding company agreed to meet certain weekly reporting requirements (1984 FRB 364). Also, by order dated December 16, 1985, the Board allowed the sale of official checks with no maximum limitation as long as the proceeds of checks in excess of $10,000 were deposited in a demand account and the bank holding company made weekly reports of these checks as well as money orders that had a face value of up to $10,000 (1986 FRB 148). The Board later authorized the issuance and selling of variably denominated payment instruments without limitation as to face value. (See 1993 FRB 42.) As part of the comprehensive revision of Regulation Y, effective April 21, 1997, the Board removed the limitation of the face amount of payment instruments. (See section 225.28(b)(13) of Regulation Y.)

3210.0.1 INSPECTION OBJECTIVES

1. To determine that the scope of the activity is within the parameters established by the Board.
2. To determine if there is any loss exposure due to the lack of systems and controls.

3210.0.2 INSPECTION PROCEDURES

In determining whether a significant degree of risk exposure to the BHC exists, the examiner should address the following questions to management, when considered appropriate:

1. Are there written agreements between the bank and its parent concerning the obligations of each for the sale of money orders and U.S. savings bonds and for the issuance and sale of travelers' checks? Do the agreements provide information on the fees, reimburseable expenses, sharing of overhead expenses, and taxes?
2. Who prints the travelers' checks and money orders?
3. Is the printer bonded or covered by insurance?
4. Is the newly printed inventory of travelers' checks and money orders received in dual custody?
5. If check inventory sent to outlets is on a consignment basis, does the consignee acknowledge receipt on a "trust receipt"?
6. Does the consignment "inventory invoice" describe, in complete detail, the number of checks, serial numbers, and denominations?
7. How are inventories and sales monitored at the outlet level?
8. What are the maximum dollar shipments for the day, per outlet and per package?
9. Does the subsidiary bank maintain the settlement account?
10. What procedures are in effect to establish the checks that have been sold?
11. What are the remittance requirements for the agents for checks sold?
12. If losses and redemptions exceed proceeds from sales, who makes up the deficiency?
13. Does the parent invest the settlement account's float, generated by the excess of proceeds received over checks redeemed, in long-term investments?
14. If a nonbank subsidiary acts as agent on behalf of its parent, what fee is paid by the parent other than commissions on the sale of checks?
15. Is the subsidiary reimbursed for its expenses?
16. What has been the history of losses?
17. How long are losses carried in suspense accounts before being charged off?
18. Does the subsidiary bank maintain compensating balances in financial institutions as

an inducement for the financial institutions to carry the holding company's travelers' checks? If so, does the parent compensate the bank for lost income?

19. What internal audit procedures are in place? Discuss frequency, scope, and follow-up.

3210.0.3 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Adding activity to permissible list (excluding issuance of travelers' checks)		225.28(b)(13)		1979 FRB 265
Adding the issuance of travelers' checks to permissible list		225.28(b)(13)		1981 FRB 912
Increased face value or payment instruments to $10,000, if weekly reports provided				1984 FRB 364
Sale of official checks with no maximum amount, if checks in excess of $10,000 deposited in demand deposit account, if weekly reports of checks made as well as money orders with face value up to $10,000				1984 FRB 148
Sale of official checks with no maximum limitation provided the proceeds of checks in excess of $10,000 were deposited in a demand account and that weekly reports of the official checks were made as well as the total value of official checks with face values exceeding $10,000				1986 FRB 148
Issuing and selling drafts and wire transfers in foreign currencies				1988 FRB 252
Issuing and selling variably denominated payment instruments without limitation as to face value				1993 FRB 42
Removal of the limitation on the face amount of payment instruments		225.28(b)(13)		1997 FRB 275

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

As noted in section 3210.0, the Board has authorized the issuance and sale of various payment instruments. This section provides brief historical summaries of the initial Board orders that led to the incorporation of the activity into the Regulation Y ‘‘laundry list.’’ Provisions within the Board orders, including commitments and any regulatory references, should not be relied upon as provisions that are currently authorized. For the current regulatory authorization, see section 225.28(b)(13) of Regulation Y, effective April 1997.

3210.1.1 ISSUING CONSUMER-TYPE PAYMENT INSTRUMENTS HAVING A FACE VALUE OF NOT MORE THAN $10,000

A bank holding company applied for the Board’s approval under section 4(c)(8) of the BHC Act and section 225.23 of the Board’s Regulation Y to engage de novo in the issuance and sale of variably denominated payment instruments with a maximum face value of $10,000. The instruments would be sold in U.S. dollars and foreign currency by the holding company’s subsidiaries and unaffiliated financial institutions and would consist of domestic and international money orders and official checks. They would also be used for certain internal transactions, such as payroll. The Board had recently amended Regulation Y to include on the list of permissible nonbanking activities the issuance or sale of money orders and other similar consumer-type instruments with a face value not exceeding $1,000. The Board concluded that an increase in the denomination of such instruments would not affect their fundamental nature.

As a condition to its approval, the Board required the bank holding company to file with the Board weekly reports of daily data on the activity. The issuance of such instruments with a face value of more than $1,000 could have an adverse effect on the bank holding company’s reserve base. Because reserve requirements serve as an essential monetary policy tool, the Board was concerned that the proposal might result in adverse effects resulting from an erosion of reservable deposits within the banking system (1984 FRB 364).

3210.1.2 ISSUING AND SELLING OFFICIAL CHECKS WITH NO MAXIMUM FACE VALUE

Effective December 16, 1985, the Board approved by order a bank holding company’s application to sell official checks with no maximum limitation on the face value, so long as the proceeds of checks in excess of $10,000 were deposited in a demand account at its subsidiary until the respective payment instrument was paid. To address the Board’s monetary policy concerns about the activity potentially causing a significant reduction in the reserve base or resulting in other adverse effects on the conduct of monetary policy, the bank holding company agreed to make weekly reports of all outstanding instruments (including money orders and official checks) with face values of up to $10,000, and also the aggregate value of all official checks with face values exceeding $10,000 (1986 FRB 148).

3210.1.3 ISSUING AND SELLING DRAFTS AND WIRE TRANSFERS PAYABLE IN FOREIGN CURRENCIES

A foreign bank subject to the BHC Act applied for the Board’s approval under section 4(c)(8) of the act and section 225.23(a)(3) of Regulation Y to engage de novo through a wholly owned subsidiary in the issuance and sale of foreign drafts and wire transfers with unlimited face amounts that are payable in foreign currencies. The applicant proposed to conduct these activities through the subsidiary as well as through a nationwide network of unaffiliated selling agents, including commercial banks, thrift institutions, and others.

The Board previously determined that the issuance and sale of money orders and similar payment instruments with a maximum face value of $1,000 is closely related to banking. (See former section 12 C.F.R. 225.25(b)(12).)[1] The Board also approved by order a limited number of applications to engage in the issuance and sale of (1) payment instruments with a $10,000 maximum face amount (see 1987 FRB 727) and

1. Effective April 21, 1997, the $1,000 limit was eliminated. The revised Regulation Y (see section 225.28(b)(13)) authorizes the issuance of payment instruments of any amount.

(2) payment instruments with unlimited face amounts, subject to certain operational and reporting requirements (see 1986 FRB 148).

In considering the previous applications, the Board expressed concern that the issuance of payment instruments in denominations larger than $1,000[2] would have an adverse effect on the reserve base because such instruments are not subject to the transaction reserve account requirements of the Board's Regulation D. The Board noted that because reserve requirements serve as an essential monetary policy tool, the conduct of monetary policy could be adversely affected by the erosion of reservable deposits in the banking system.

To address the concerns expressed in previous Board orders, the applicant committed that the proceeds of all sales of foreign-currency-denominated instruments will be held in demand deposit accounts at U.S. commercial banks. Deposits stemming from the sale of instruments with denominations of $10,000 or less are to be swept daily into nonreservable instruments. The total proceeds of the sale of any payment instruments with denominations greater than $10,000 will be deposited in a demand deposit account at a U.S. depository institution, to be used to purchase foreign currency for each particular payment instrument at the time of the transaction. The Board determined that these commitments and other procedures outlined in the order adequately addressed its concerns about the potential adverse effects on the reserve base. The Board approved the application on February 3, 1988, subject to the continued evaluation of its potential for adverse effects on the conduct of monetary policy (1988 FRB 252).

3210.1.4 ISSUING AND SELLING VARIABLY DENOMINATED PAYMENT INSTRUMENTS WITHOUT LIMITATION AS TO FACE VALUE

A bank holding company applied for the Board's approval under section 4(c)(8) of the BHC Act to engage both directly and indirectly through a bank holding company nonbank subsidiary in the issuance and sale of variably denominated payment instruments without limitation as to face value and without the reporting and reservable deposit requirement previously imposed by the Board on issuers of such instruments.

The Board previously determined by regulation that the issuance and sale of money orders and other similar consumer-type payment instruments with a face value not exceeding $1,000[3] is an activity that is closely related to banking and is therefore permissible for bank holding companies (see former section 225.25(b)(12) of Regulation Y (12 C.F.R. 225.25(b)(12))).

Effective December 22, 1992, the Board amended Regulation D to impose reserve requirements on teller's checks. The Board's notice amending Regulation D stated that bank holding companies that had received prior approval under section 4(c)(8) of the BHC Act to issue and sell variably denominated payment instruments—subject to the demand deposit requirement, reporting requirement, or limits on the denomination of payment instruments—could request relief by letter from those conditions. The Board believes that the adverse effect of erosion of the reserve base is addressed in the Regulation D revisions, and special reporting and demand deposit requirements previously imposed by the Board in connection with approvals to engage in the issuance and sale of variably denominated payment instruments in amounts over $10,000 are no longer needed. As a result, the Board determined not to impose those requirements on the applicant and to grant the applicant's request for relief from the reporting requirement to which it was subject. The Board approved the application on November 12, 1992, subject to the Regulation D effective date of December 22, 1992, and the conditions and commitments stated in the order (1993 FRB 42).

2. See footnote 1.

3. See footnote 1.

Section 4(c)(8) of the BHC Act (Arranging Commercial Real Estate Equity Financing) Section 3220.0

Effective September 1, 1982, the Board approved an application of a bank holding company to engage in, through a nonbank subsidiary, the activity of arranging equity financing for certain types of income-producing properties (1982 FRB 647). The Board limited the activity by requiring that the holding company act only as an intermediary between developers and investors to arrange financing, and imposed certain other conditions to prevent the holding company from engaging in real estate development or syndication. At that time, however, the Board did not expand the Regulation Y list of permissible activities for bank holding companies to include this activity.

In February 1984, the Board added the arranging of commercial real estate equity financing to the list of permissible nonbanking activities in Regulation Y (section 225.28(b)(2)(ii)). Regulation Y incorporated the limitations placed on the activity by the Board's 1982 order, which is discussed below.

Equity financing involves arranging for the financing of commercial or industrial income-producing real estate through the transfer of the title, control, and risk of the project from the owner or developer to one or more investors. In performing the equity-financing activity for commercial or industrial income-producing real estate, consultations should be made with the owner or developer to determine the nature, objectives, and financing arrangements for the property or project. The project's concept, architectural design, building layout, suitability for its purpose and prospects, traffic flow, as well as competing projects, source(s) of customers, nature of the market, projected rentals and income flows, timetables for completion, and the availability of construction and long-term financing for the property, have to be carefully reviewed. Financing alternatives, including equity financing, should be predetermined.

The Board has found that the particular expertise and analysis required to provide equity financing for large commercial or industrial income-producing properties is functionally and operationally similar to the analysis and expertise that is required when a bank provides traditional mortgage financing services for such properties. This finding is supported by the fact that equity financing can be viewed as an economic substitute for long-term mortgage financing. The Board's view is that equity financing, subject to the limitations described below, bears a functional relationship to investment advisory services that are traditionally and lawfully performed by commercial banks with respect to commercial and industrial real estate.

The Board therefore, in 1984, approved adding the arranging of commercial real estate equity financing to the list of permissible nonbanking activities in Regulation Y. On April 21, 1997, the comprehensive revision of Regulation Y removed certain restrictions from this nonbanking activity. The activity currently consists of acting as an intermediary for the financing of commercial or industrial income-producing real estate by arranging for the transfer of title, control, and risk of such a real estate project to one or more investors, if the bank holding company and its affiliates do not have an interest in, or participate in, managing or developing a real estate project for which it arranges equity financing, and do not promote or sponsor the development of the property.

3. Federal Reserve Regulatory Service reference.

3230.0.1 OVERVIEW OF SECURITIES BROKERAGE AS A NONBANKING ACTIVITY

In addition to providing a full panoply of financial services to their customers, banks and bank holding companies seek ''off-balance-sheet'' or non-asset-building sources of revenue. Securities brokerage is one type of endeavor perceived to have growth and profit potential.The main reasons for this are easy market entry, low start-up costs, and maximum use of a branch system and customer base.

After the deregulation of brokerage commissions in 1975, certain brokers began to compete for securities business by drastically reducing their commissions. In order to reduce operating expenses, yet still remain profitable at reduced commission rates, these firms ceased investment research and offered their customers a reduced level of service by ''unbundling'' brokerage services and offering only the execution of securities transactions. Brokers who offer this reduced level of service have come to be known as ''discount brokers.''

The Board, in 1983, added ''securities brokerage'' to the list of permissible activities for bank holding companies shortly after it approved the application of BankAmerica Corporation to acquire Charles Schwab & Co., as discussed below. In 1984, the U.S. Supreme Court sustained the Board's approval order and ruled that it is not a violation of the Glass-Steagall Act for banks and bank-affiliated brokers to buy and sell securities as agent for customers (SIA v. Board of Governors, 104 S. Ct. 3003). For additional historical information regarding the expansion of securities brokerage nonbank activities by Board order or by incorporation into Regulation Y, see sections 3230.1 through 3230.3.

Before April 21, 1997, Regulation Y differentiated between securities brokerage services provided alone (that is, discount brokerage services) and securities brokerage services provided in combination with investment advisory services (that is, full-service brokerage activities). Regulation Y no longer distinguishes between discount and full-service brokerage activities.

Regulation Y currently authorizes securities brokerage services (including securities clearing and/or securities execution services on an exchange), whether alone or in combination with investment advisory services and incidental activities (including such related activities as securities credit, custodial services, individual retirement accounts, and cash-management services), if the services are restricted to buying and selling securities solely as agent for the account of customers and do not include securities underwriting or dealing. In addition to the information and examiner guidance provided in this section, see the American Institute of Certified Public Accountants' *Audit and Accounting Guide—Brokers and Dealers in Securities.*[1] The guide includes detailed information about the securities industry, broker-dealer functions, activities and operations, books and records, accounting and auditing standards and considerations, and other topics such as internal controls and regulatory considerations.

3230.0.2 INITIAL BOARD ORDER APPROVAL FOR SECURITIES BROKERAGE

On January 7, 1983, the Board approved the application of BankAmerica Corporation to acquire Charles Schwab & Co., which engaged in retail discount securities brokerage, securities credit lending, and certain incidental activities (1983 FRB 105). None of the proposed activities was among those the Board had previously designated in Regulation Y as being closely related to banking.

In its order approving the application, the Board found that the brokerage and securities credit activities were closely related to banking for purposes of section 4(c)(8) of the Bank Holding Company Act (''BHC Act''). That decision was based on the fact that many banks provide various types of securities brokerage services as an accommodation to customers and as an agent for trusts and other accounts managed by banks.

Banks also administer employee stock purchases, dividend reinvestment, and automatic investment service plans, which involve the periodic purchase of a particular security or securities from a fixed list of securities, on behalf of the customer. Banks often execute orders involving securities not listed on an exchange by dealing directly with dealers making a market in a particular security or with other third parties. In performing these services,

1. Issued as of April 1, 1997.

banks exercise the same type of discretion and judgment with respect to the best method of execution as brokers do with respect to similar types of orders. Further, national banks are expressly authorized by statute to purchase and sell securities without recourse, solely upon the order, and for the account of, customers (12 U.S.C. 24 (Seventh)).

The Board, in summary, noted that banks in fact had generally provided securities brokerage to some extent. The company that was acquired, pursuant to the January 1983 order, provided several other services incidental to its discount brokerage activities.

3230.0.2.1 Margin Lending

Historically, banks have had a significant amount outstanding in loans to borrowers for the purpose of purchasing or carrying securities. The extension of such credit secured by stock and other collateral, or margin lending, has long been an important bank activity. The Board, therefore, ruled that this activity was closely related to banking and incidental to the securities brokerage activities of the company being acquired.

3230.0.2.2 Maintenance of Customer Securities Accounts

Charles Schwab & Co. offered various services to its brokerage customers. These services included individual retirement accounts for which an unaffiliated savings and loan association served as a trustee; a ‘‘sweep’’ arrangement, pursuant to which idle customer balances exceeding a certain minimum were automatically invested in an unaffiliated money market mutual fund; the payment of interest on net free balances awaiting investment; and a specially named account which combined the payment of interest on free credit balances with customer access to such balances through a debit card and checking account offered under an arrangement with an unaffiliated commercial bank. Increasingly, these types of services were being offered by other brokerage firms. The Board found that each of these services was identical, or functionally and operationally equivalent to, services generally offered by banks to customers directly or through bank trust departments. Based on that finding, the Board found that the provision of those accounts was closely related to banking as well as an incidental activity in connection with securities brokerage and margin lending activities.

3230.0.2.3 Custodial Services

The brokerage firm also provided various types of securities custodial services, involving the safekeeping of customers’ securities, accounting for dividends or interest received on such securities, and other ancillary services. Banks generally offer securities custodial services in connection with their trust departments and other securities transaction services. Furthermore, in extending margin credit, a lender is required to maintain custody of the securities pledged to the lender as collateral to secure the loan. Accordingly, the Board found that the provision of securities custodial services was closely related to banking and that it was a necessary incident to permissible margin lending activities.

3230.0.3 MARGIN CREDIT ACTIVITIES AND SECURITIES BROKERAGE

When securities brokerage was added to the permissible activities within Regulation Y, it was contemplated that a bank holding company, or its nonbank subsidiary performing the permitted securities brokerage activities, would be required to register as a broker-dealer with the Securities and Exchange Commission and that its margin credit activities would therefore be subject to the Board’s Regulation T. Regulation T governs securities credit by broker-dealers (12 C.F.R. 220).

3230.0.4 FINAL RULE ADOPTION—ACTIVITY INITIALLY ADDED TO REGULATION Y

On August 10, 1983, the Board adopted a final rule deeming securities brokerage and margin lending ‘‘closely related’’ to banking, consistent with the Glass-Steagall Act, and are, therefore, generally permissible for bank holding companies. To clarify that services incidental to brokerage services are permissible, the Board did include a list of permissible incidental services. The list included services such as offering custodial services, furnishing individual retirement accounts, and cash-management services, provided that the securities brokerage services are restricted to buying and selling securities solely as agent for the account of customers and do not include securities underwriting.

As for cash-management services, such services are intended to include customer- account-related functions, such as paying interest on net free balances awaiting investment, providing arrangements under which free credit balances are automatically invested in money market mutual funds, and establishing arrangements under which access to such balances is provided by debit card or checking accounts.

The list of incidental activities in the regulation is not intended to be exhaustive. The Board believes that to compete effectively with other brokers, bank holding companies should have the flexibility to provide a full range of customer-account and custodial services, provided such services meet the test for permissible incidental activities under section 4(c)(8) of the BHC Act and are consistent with the Glass-Steagall Act.

As previously noted, Regulation Y, effective April 21, 1997, permits securities brokerage without distinguishing between discount and full-service brokerage activities. The previous regulatory requirement for certain disclosures has been eliminated. Those disclosure requirements are in an interagency policy statement that governs the sale of securities and other nondeposit investment products on bank premises (see sections 2010.6.1.3.1 and 2010.6.2.9), as well as in SEC rules. Similar disclosure requirements are required by the Board's policy statement that governs a bank holding company's sale of shares of mutual funds and other investment companies that it advises (see section 225.125 of Regulation Y).

3230.0.5 MARKET ENTRY INTO SECURITIES BROKERAGE

There are three general methods of market entry available to bank holding companies or nonbank subsidiaries of bank holding companies wishing to offer securities brokerage services: (1) become associated with a brokerage firm, (2) purchase an existing firm, or (3) establish their own brokerage operations. The most common mode is broker association, which is less costly and the most rapid form of entry. The following broker relationships are presently established:

1. *Introducing broker*. The first level of involvement occurs when a BHC or a nonbank subsidiary of a BHC serves as an ''introducing broker'' in effecting securities transactions by accepting the customers' orders and transmitting the orders to the executing broker.[2] Order tickets and records of original entry are prepared by the BHC or nonbank subsidiary. In this situation, the executing broker generally produces customer confirmations and account statements. These documents often prominently display the BHC or the bank holding company's nonbank subsidiary's name and logo. The executing broker, the bank holding company, and/or its nonbank subsidiaries may offer safekeeping services and margin credit.
2. *Omnibus account*. A higher level of bank holding company nonbank subsidiary involvement occurs when the broker ''carries'' customer accounts by accepting and transmitting orders for execution, producing the customer confirmation, and maintaining all customer records. When carrying customers' accounts, the bank holding company's nonbank subsidiary may maintain a single customer account, called an omnibus account, with the executing broker. Safekeeping and margin credit services may be offered.
3. *Separately incorporated broker-dealer subsidiary affiliate*. The highest level of involvement occurs when a bank holding company organizes or acquires a separately incorporated broker-dealer subsidiary or affiliate, which transacts business like any other broker-dealer. This would include its own customer lists, both retail and wholesale; possible exchange membership; and executing and clearing its own transaction.

3230.0.6 PURPOSE OF INSPECTION OF SECURITIES BROKERAGE ACTIVITIES

The purpose of the inspection is to evaluate any potential liability due to wrongful or negligent performance of responsibilities, to assess the level of management expertise, and to determine the degree of compliance with legal and policy parameters necessary to protect investors.

2. There is a lower level of involvement wherein the BHC or nonbank subsidiary is responsible for making the brokerage services available to customers by advertising the distributing customer account applications. Account acceptances are generally made by the unaffiliated broker who will receive orders directly from customers.

3230.0.7 INSPECTION OBJECTIVES

1. To determine the scope and nature of services provided.
2. To evaluate operations, audits, and controls.
3. To review the sufficiency of administrative policies and procedures.
4. To determine the level of responsibility.
5. To appraise the quality of management and staff.
6. To ascertain earnings, volume of business, and prospects.
7. To review compliance with applicable laws, regulations, and policies.

3230.0.8 SCOPE OF INSPECTION

The scope of inspection will vary depending on the nature of the brokerage operation. In defining the scope of inspection, it is first necessary to determine the extent of activities performed and the corporate structure. Any bank holding company subsidiary (that is not a bank), which functions as a securities broker, is required to register as a broker-dealer with the Securities and Exchange Commission (SEC).[3]

In developing the scope of inspection, it is emphasized that Reserve Bank examiners can rely on the applicable self-regulatory organization's examination with respect to investor protection, compliance with SEC and SRO rules, and Regulation T. The self-regulatory organizations do not furnish an examination report, but instead furnish a registered broker-dealer with a letter pertaining to examination findings. Hence, the scope of inspection for a registered broker-dealer will commence with a review of a self-regulatory organization's most recent letter dealing with its examination of brokerage activities. A broker-dealer belonging to more than one self-regulatory organization will be examined only once in each examination cycle. Serious violations that could endanger a banking organization (for example, fraudulent activities that could subject the organization to losses or lawsuits) or significant violations that have not yet been corrected, should be noted in the bank holding company inspection report. Reserve Bank staff are responsible for evaluating all other aspects of securities brokerage activities.

The actual scope of this portion of the inspection will range from a brief visit for a limited service ‘‘arranger’’ relationship to extensive review for an omnibus relationship or registered broker-dealer.

3. A broker-dealer registered with the SEC (registered broker-dealer) is subject to SEC recordkeeping and confirmation rules, fair practice rules, professional qualification rules for individuals associated with securities firms, and the uniform net capital rule. Registered broker-dealers are also required to pay for insurance coverage on customers' assets by the Securities Investor Protection Corporation (SIPC) and are required to be members and subject to the rules of the National Association of Securities Dealers, Inc. (NASD), or other self-regulatory organizations, such as the New York Stock Exchange. These self-regulatory organizations (SROs) also test for broker compliance with Regulation T (12 C.F.R. 220).

3230.0.9 MATERIALS REQUIRED FOR INSPECTION

When commencing the securities brokerage portion of a bank holding company or its nonbank subsidiary inspection, the following material should be obtained:

1. contractual agreement with the executing and/or clearing broker
2. recent activity report (for at least six months)
3. income and expense reports
4. written policies and procedures regarding—
   a. order processing,
   b. settlements,
   c. account reconciliations,
   d. audit coverage, and
   e. trust department relationship
5. account application forms
6. customer disclosure documents
7. organization chart
8. fee schedule
9. internal and external audit reports
10. a copy of the contingency plan for continuance in emergencies
11. the most recent SRO letter pertaining to the last brokerage examination

3230.0.10 INSPECTION PROCEDURES

If applicable, the following areas should be covered during the inspection.

3230.0.10.1 Organization and Management

Review carefully the contractual agreement with the executing and/or clearing broker and list all duties and obligations of the respective parties. Determine that the agreement contains an indemnification clause insulating against broker error. Once the review is completed, the examiner can identify the type of relationship and plan the scope of the inspection.

Review the organization chart and match responsibilities and operational functions to the appropriate section. Evaluate management and staff based upon their education, experience, performance, and the profitability and efficiency of operations and any other relevant factors.

3230.0.10.2 Operations

A securities brokerage operation is organized along functional lines including—

1. execution,
2. settlement,
3. delivery,
4. custody,
5. recordkeeping, and
6. audits and controls.

Before review, prepare a flow chart of the operation to quickly overview the operational areas and to locate control points and identify potential weaknesses.

3230.0.10.2.1 Execution

This area processes client orders. The orders may be received by telephone at the nonbank subsidiary or directly by the executing broker. When the nonbank subsidiary accepts customer orders, they can be transmitted by direct wire to the executing broker. Completed transactions initiated by the nonbank subsidiary are confirmed back to the nonbank subsidiary, which in turn sends a confirmation to the client. Examiners should determine that proper safeguards are in place to ensure valid orders are received, pending orders are controlled, and completed orders are reported for customer notification and record update. The examiner should also determine that the following are in place:

1. use of code numbers, names, or other verification devices when accepting orders
2. maintenance and reconcilement of a trade log (orders received) and execution report (orders completed)
3. taping of telephone orders
4. confirmation of completed orders are confirmed to clients in a timely fashion
5. preparation and transmittal of input media for record update

3230.0.10.2.2 Settlement

This area receives payments and proceeds, collects dividends and interest, and, in some instances, effects margin calls on broker instruction. Settlements are effected in two stages:

1. *Broker vs. customer*. Before settlement date, the customer must send cash or securities to the broker as requested in the broker's customer confirmation. Cash or securities are required to effect payment against delivery or delivery against payment in accordance with industry securities settlement procedures.
2. *Broker vs. broker*. When physical delivery of securities is required, it is generally done on a firm-to-firm basis or to a firm's safekeeping agent. Major equity securities, and an ever-increasing number of debt securities, are eligible for net settlement and securities immobilization with depositories. Usually, a net settlement account is used for cash and securities transactions; these accounts should be reconciled daily. The settlement process should include a procedure which verifies execution price and fees.

3230.0.10.2.3 Delivery

Securities are delivered to the executing broker and purchased securities to clients. The examiner should determine that safeguards provide adequate control over certificates in process. Proper fail-to-deliver/receive and completed transaction records should be maintained.

The securities broker that accepts customer orders generally is exposed to *delivery risk* by customers. Basically, customers can take advantage of the broker by placing an order to buy securities when the customer has no funds available to purchase securities or by placing an order to sell securities which are not owned by the customer. Either type of transaction is permissible in a *margin account*, provided that the customer has the resources available to properly margin the transaction. If the customer does not have a margin account, the broker should not purchase a security for the customer unless (1) there are sufficient funds in the customer's account or (2) the customer represents and the broker ascertains that the customer will promptly make full cash payment for the security before selling it, and that the customer does not contemplate selling it before making payment.

Alternatively, the broker should not sell a security for a customer unless (1) the security is held in the customer's account, or (2) the broker accepts in good faith the customer's statement that the security is owned by the customer and that it will be promptly deposited into the account.

By not executing a purchase or sale until the customer has deposited cash or securities, customer-default risks can be avoided on cash transactions. However, for competitive reasons, many brokers would not wish to place such stringent restrictions upon their customers—especially with respect to the purchase of securities. Lack of proper account supervision can lead to the fraudulent customer practice of ''free riding,'' wherein the customer will buy securities in anticipation of a price rise. Before settlement date, the customer will sell the securities to take the profits. If the market price of the securities declines, the customer will dishonor the trade, and thus attempt to leave the broker holding the depreciated securities. Securities brokerage procedures should be designed to look for generally abusive practices by customers.

3230.0.10.2.4 Recordkeeping

Any records which must be prepared by the broker under inspection are subject to the Securities and Exchange Commission's recordkeeping and confirmation rules 17a-3 and 17a-4. Compliance with those recordkeeping rules will be verified by stock exchange or NASD examiners during their routine compliance inspections.

3230.0.10.2.5 Audits and Controls

Complete the ''Securities Brokerage/Internal Controls Checklist'' to determine whether operations are satisfactorily controlled and audited by the bank holding company's or nonbank subsidiary's audit staff. All significant administrative and operational aspects should be covered. Management should receive reports of audit findings and respond in writing as to actions taken.

3230.0.10.3 Conflicts of Interest

Determine that policies have been effectively implemented covering relationships with affiliated trust departments, self-dealing, fee-splitting or rebate arrangements, and officer/employee transactions.

3230.0.10.3.1 Relationship with Affiliated Trust Departments

Questions may arise concerning the permissibility of a securities broker's executing securities transactions for an affiliated trust department. In general, the receipt of commission income for securities brokerage transactions entered into on behalf of a trust account (in addition to the fee received for account administration) raises conflict-of-interest considerations to which traditional prohibitions of fiduciary law are directed. When a securities broker affiliate is used, the trust institution may be considered to share indirectly in the commission income of the affiliate even when there is no direct remittance of the fee to the bank. The staff letter at 3—447.11 of the Federal Reserve Regulatory Service provides guidance in determining whether and in what circumstances use of affiliated discount brokerage services may or may not be permissible. If questionable trust department use of affiliated broker services is disclosed, appropriate trust examiner(s) should be notified.

3230.0.10.4 Earnings, Volume Trends, and Prospects

Determine the present and future impact that the securities brokerage activities may have on the bank holding company and its subsidiaries. If possible, a separate profit center should be established, thus providing a useful management tool which facilitates analysis of current profitability, business volume, fixed and variable costs, and degree of goal actualization. Periodic review of these factors will enable management to direct available resources, aid in the budget process, and provide a basis for business planning. Prospects for profitable growth should be assessed by noting changes in aggregate account levels and trade activity. The local competitive environment should be gauged and market-share information noted. In considering these factors, the examiner should attempt to determine what level of activity must be maintained or attained in order for the securities brokerage function to break even. Present a summary statement expressing an overall view on the current state and future viability of the operation.

3230.0.10.5 Compliance

The examiner should determine whether any additional state regulations must be complied with. Also determine that staff is aware of and complying with applicable regulations and laws, which may be outside the scope of an examination conducted by a self-regulatory organization.

3230.0.10.6 Presentation of Findings

The Scope of Inspection in the report should note that securities brokerage activities were reviewed. It should be noted that in order to avoid duplication of examination procedures, the inspection did not focus upon securities laws compliance (as verified by the NASD, Inc., or stock-exchange examiners), but instead focused upon financial and safety-and-soundness considerations. Appropriate nonbank subsidiary pages should be completed. Present a summary comment in the confidential section reflecting an overall appraisal of the operation. The self-regulatory organization responsible for examining the securities brokerage operation should be identified. Identify also the associated broker, if any, with whom the organization conducts business. Any material exceptions should be noted with management's responses under an appropriate caption within the open section. Matters of importance should be brought forward to the Examiner's Comments and Matters Requiring Special Board Attention page. In addition, any other significant problems, detrimental practices, or potential liabilities which could have a negative impact on the organization should be commented upon.

3230.0.11 EXAMINATION CHECKLISTS

Two checklists are provided for use by the examiner to aid in evaluating securities brokerage activities:

1. Securities Brokerage Inspections
2. Securities Brokerage/Internal Controls

All questions are not applicable for each brokerage subsidiary. The nature and scope of brokerage activities determine the applicability of specific questions. The term ‘‘banking organization’’ refers to a bank holding company and any of its nonbank subsidiaries.

3230.0.11.1 Securities Brokerage Inspection Checklist

	Yes	*No*
1. Is a contractual agreement between the banking organization and the executing and/or clearing broker on file?	______	______*
2. Does the agreement indemnify the banking organization against broker error?	______	______*
3. Does the agreement clearly define respective responsibilities of the banking organization and broker?	______	______*
4. Was the agreement reviewed by the banking organization's counsel?	______	______*
5. Was the agreement approved by the board of directors? If not, by whom? _________	______	______*
6. Are written procedures covering brokerage activities in effect?	______	______*

*Response may require report comment.

	Yes	No
7. Have job descriptions been prepared?	______	______*
8. Have specific policies been developed regarding—		
• relationships with affiliated bank trust depts?	______	______*
• conflicts of interest?	______	______*
• investment advice?	______	______*
9. Are investment advice or research services being offered?	______*	______
10. Are income and expense records separately maintained?	______	______*
11. Are brokerage activities included in the audit program?	______	______*
12. Are customer orders placed with banking organization personnel?	______	______
If so, is customer authorization on file?	______	______*
Are telephone conversations tape recorded?	______	______*
Are transaction records maintained by traders?	______	______*

13. How are payments effected? (check one)

direct charge to customer account	______
payment through the mail	______
other ____	

14. What is the timeframe of payment?

prior to execution	______
upon verbal notification of execution	______
upon customer's receipt of confirmation	______
after settlement date	______*

15. What is the frequency of settlement-account reconcilements?

daily	______
biweekly	______
weekly	______
other	______*

*Response may require report comment

	Yes	*No*
16. Does an affiliated trust department use the discount brokerage service?	______	______*
If yes, what type account? ________________________		
discretionary trust ______**		
discretionary agency ______**		
custody ______		
employee benefit ______**		
17. Is sufficient insurance coverage in effect?	______	______*
Describe types and limits.		
______________________________________		
______________________________________		
18. Does a review of records confirm that the broker functions solely as an agent, i.e., does not engage in underwriting or taking positions for its own account?	______	______*
19. Do monitoring and internal reporting procedures adequately track profitability and operating impact for management consideration?	______	______*

*Response may require report comment.

**If available documentation reveals that affiliated trust departments use brokerage services to execute transactions for this type of account, the appropriate federal regulator of trust activities should be notified.

3230.0.11.2 Securities Brokerage/Internal Control Checklist

The following questions should be answered, to the extent applicable, in reviewing a securities brokerage operation. Few brokers will perform all of the activities discussed below.

	Yes	*No*
1. Do internal audit procedures include the securities brokerage function?	______	______*
2. Has the banking organization adopted procedures for the periodic review of insurance coverage relating to securities brokerage activities (e.g., errors and omissions, fidelity bonding, and securities in transit)?	______	______*
3. Has the banking organization adopted procedures with respect to the accounts of directors, officers, or employees or their immediate families?	______	______*
4. Are procedures in place to prevent internally generated credits to the securities brokerage customers' accounts from being automatically recorded as collected funds?	______	______*

*Response may require report comment.

	Yes	*No*
5. Are procedures in place to ensure that acceptance of a relatively large order will not be effected unless the order taker verifies that the customer placing the order has internal authorization to engage in large trades?	______	______*
6. Has the banking organization adopted written procedures prohibiting employees from furnishing investment advice?	______	______*
7. Are customer telephone orders tape recorded?	______	______*
8. Are tape recordings of telephone orders reviewed periodically to verify that employees have *not* made securities recommendations or furnished investment advice?	______	______*
9. Are persons responsible for taking and transmitting orders precluded from preparing accounting entries?	______	______*
10. Is there adequate separation of duties between persons responsible for making initial accounting entries and those responsible for making subsequent adjusting entries to prevent a concealment of theft or fraud?	______	______*
11. Does the securities brokerage function monitor and reconcile safekeeping, clearing, payment, and income expense accounts on a regular basis?	______	______*
12. Has management developed a contingency plan to ensure continued brokerage operations of the securities brokerage operation in the event of fire, flood, power failure, or some other unforeseen event?	______	______*
13. With respect to termination of brokerage accounts, does the securities brokerage operation have procedures in place to prevent an account from being closed while an open securities order is outstanding?	______	______*
14. Does the credit-approval process require a credit decision to be made by someone who routinely makes credit decisions—as opposed to a manager of a securities brokerage operation?	______	______*
15. If securities received from customers are registered in the name of a third party, are procedures in place to ensure that such securities are accepted only upon satisfactory proof of ownership?	______	______*
16. Are procedures in place to ensure that customers delivering securities registered in a ‘‘street name’’ have title to such securities (i.e., they are not lost or stolen securities)?	______	______*
17. Is only a limited number of responsible employees authorized to execute or guarantee security assignments?	______	______*
18. Is the use of facsimile signature devices adequately controlled?	______	______*

*Response may require report comment.

	Yes	*No*
19. Are procedures in place to control cash, securities, and documents pertaining to securities shipped for ‘‘delivery against payment’’?	______	______*
20. Are adequate physical controls maintained over securities on hand (e.g., restricted access to the ‘‘cage area’’)?	______	______*
21. Are detail records pertaining to securities in transfer and those pledged as collateral to borrowings agreed periodically (at least quarterly) with the securities record?	______	______*
22. Are security positions (and related general-ledger amounts) in suspense accounts investigated and resolved on a timely basis?	______	______*
23. Are fails to receive and fails to deliver periodically reviewed and reconciled?	______	______*

*Response may require report comment.

3230.0.12 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws*[1]	*Regulations*[2]	*Interpretations*[3]	*Orders*
Board's authority for rulemaking and jurisdiction over BHCs	1843(c)(8), 1844(b)			
Order approving the application of a BHC to acquire a retail discount securities broker				1983 FRB 105
Order approving acquisition of retail discount broker by a BHC				1983 FRB 565
Securities brokerage as a permissible activity		225.28(b)(7)(i)		
Credit by brokers and dealers—Regulation T	220			
Order approving the provision of combined securities brokerage, investment advisory, and research services				1986 FRB 584
Securities brokerage subsidiary can exchange customer lists with affiliates and confidential customer information (with customer approval)				1988 FRB 571

4(c)(8)—Securities Brokerage (Board Decisions)

Section 3230.05

This section serves as a prelude to the securities brokerage sections that follow. Sections 3230.1 through 3230.3 provide brief historical summaries of Board decisions on securities brokerage; these authorizations are now incorporated into Regulation Y for this activity. The summaries provide the reader with some historical perspective as to how and why the current provisions of Regulation Y evolved. The conditions and commitments within these orders may no longer apply to the current provisions of Regulation Y. Therefore, reference must be made to Regulation Y, section 225.28(b)(7)(i).

Before the 1997 revisions of the Board's Regulation Y (12 C.F.R. 225), the Board's rules differentiated between securities brokerage services provided alone (that is, discount brokerage services) and securities brokerage services provided in combination with investment advisory services (that is, full-service brokerage activities). The revisions to Regulation Y that became effective in April 1997 permit securities brokerage without distinguishing between discount and full-service brokerage activities.

Another major change for securities brokerage activities concerns the types of disclosures required of bank holding companies. Before the 1997 revisions, bank holding companies providing full-service brokerage services were required to make certain disclosures to customers regarding the uninsured nature of securities and were not permitted to disclose confidential customer information without the customer's consent. Effective in April 1997, these disclosure requirements were eliminated. The disclosure requirements—along with a number of other requirements that specifically address the potential for customer confusion, training requirements, suitability requirements, and other matters—are already contained in an interagency policy statement that governs the sale of securities and other nondeposit investment products on bank premises, as well as in rules adopted by the SEC. In addition, similar disclosure requirements are required by the Board's policy statement governing the sale by bank holding companies of shares of mutual funds and other investment companies that the bank holding company advises.

Banking organizations and their affiliates, in general, are becoming more effective in implementing the regulatory disclosure requirements. Customers are also becoming increasingly aware that such investment products purchased at banking organizations and their affiliates are not federally insured. Moreover, the Board and the SEC have adequate supervisory authority to ensure that bank holding companies comply with the applicable regulatory disclosure requirements. To the extent that disclosures to customers are appropriate in areas not covered by the regulatory policy statements or SEC regulations, the Board will consider whether to develop supervisory guidance.

Two bank holding companies jointly applied for the Board's approval under section 4(c)(8) of the BHC Act and section 225.23(a)(3) of Regulation Y to form a de novo subsidiary that would engage in the following nonbanking activities:

1. providing portfolio investment advice to ''institutional customers''
2. providing securities execution (brokerage) services, related securities credit activities pursuant to the Board's Regulation T, and incidental activities
3. furnishing general economic information and advice, general economical statistical forecasting services, and industry studies to institutional customers
4. serving as an investment adviser (as defined in section 2(a)(20) of the Investment Company Act of 1940) to investment companies registered under that act

Separate fees are to be charged for the advisory services and the securities brokerage services. The company would also provide incidental services such as custodial and cash-management services and acting as a registered investment adviser. The services are to be provided throughout the United States. The providing of advisory services to retail clients was not authorized by the Board. The applicant committed to create a ''Chinese Wall'' between the affiliated bank and the securities affiliate.

The Board determined that the activities would not violate Glass-Steagall Act prohibitions. Board approval was conditioned with the requirement that the standards of care and conduct applicable to fiduciaries would be observed. The applicant would not allow the exchange of confidential information between the de novo subsidiary and its affiliates. The applicant further committed that employees of the de novo subsidiary would not be given customer lists and other confidential information obtained by its affiliates in connection with commercial banking operations. Transmission of advisory research and recommendations to the commercial lending department of any of the bank holding company's affiliates was not permitted.

The proposal represented the combination of activities, previously determined to be closely related to banking, in such a way that the functional nature and scope of the combined activities conducted would not be altered. By Board order, the applicants' application was approved on June 13, 1986 (see 1986 FRB 584), subject to the conditions stated therein. Other orders were approved by the Board on August 5, 1987 (1987 FRB 810), and October 1, 1987 (1987 FRB 930), which also authorized a bank holding company to engage in combined investment advisory and securities brokerage activities. In this order, the Board lowered the threshold for defining an ''institutional investor'' from $5 million to $1 million.

The Board, effective September 10, 1992, added this nonbanking activity to those activities that are permissible by regulation, currently found in section 225.28(b)(7)(i) of Regulation Y, subject to the disclosure requirements, restrictions on exchanging confidential customer information, and other limitations stated therein.

A bank holding company applied to the Board to expand the authority of its subsidiary to engage in offering investment advisory services for ''institutional customers'' and its affiliates[1] in conjunction with its previously approved brokerage services. The Board previously approved by order (1986 FRB 584) an application for a different bank holding company to offer the combination of investment advice and securities execution services for institutional customers.

The proposed activities in this order (1987 FRB 810) are similar except that the subsidiary would additionally exercise limited investment discretion at a customer's specific request. Under this plan, the subsidiary would offer as a service, within defined parameters established by the client, discretion in buying and selling securities on behalf of the client.

Such investment discretion would be exercised only at the request of a client; the subsidiary does not plan to market or solicit managed accounts. Each client will receive confirmation of each transaction, as well as monthly statements which would indicate in detail the terms of each transaction executed on its behalf. Each client would always be aware of the scope of the subsidiary's activity for its account. The subsidiary would receive a single fee for the combined activities of providing investment advice and exercising limited investment discretion.

The application was approved on August 5, 1987, subject to the commitments made by the applicant and the conditions (whether explicitly stated or incorporated by reference) in the order.

The Board approved another order on October 1, 1987 (1987 FRB 930), similar to the August 5, 1987, order, except that (1) the applicant proposed to lower the test for institutional customers from the $5 million threshold to $1 million; (2) the applicant's wholly owned brokerage subsidiary would share customer lists with its affiliates, but not confidential information obtained from the customer; and (3) the brokerage subsidiary would have officer and director interlocks with the parent bank holding company, but not with its bank affiliates. In the Board's view, these modifications did not alter the underlying rationale of its earlier decision.

The Board approved another order on August 10, 1988 (1988 FRB 700). The principal difference between the August 5, 1987, order and this proposal was the provision of such combined services to *retail* as well as *institutional* customers. The provision of services to retail customers does not include discretionary investment management. To further ensure the separation of the BHC and its bank affiliates and to avoid potential conflicts of interests, the applicant made several commitments, as detailed within the order.

The Board, effective September 10, 1992, added the providing of discretionary investment management to the nonbanking activities that are permitted by regulation, currently found in section 225.28(b)(7)(i) of Regulation Y.

1. The provision of such services by the subsidiary to other affiliates is a permissible servicing activity under section 225.22(a) of Regulation Y.

4(c)(8) of the BHC Act—Offering Full Securities Brokerage Services for Bank-Ineligible Securities Section 3230.3

A bank holding company (applicant) applied for the Board's permission for its subsidiary to provide investment advisory and brokerage services on a combined basis (''full-service brokerage'') to institutional and retail customers and to engage, to a limited extent, in underwriting and dealing in one- to four-family mortgage-related securities and consumer receivable–related securities (herein referred to as ''ineligible securities''). The applicant committed to conduct its ineligible securities underwriting and dealing activities subject to the revenue test and the prudential limitations established by the Board in 1987 FRB 473, except for a market-share limitation which the Board decided not to require for this BHC.

The Board determined previously that full-service brokerage for both institutional and retail customers is closely related and a proper incident to banking under section 4(c)(8) of the BHC Act and does not violate the Glass-Steagall Act (1988 FRB 700 and 1986 FRB 584). This BHC's proposal differs from prior cases in that the subsidiary will provide full-service brokerage to retail customers for ineligible securities that it may hold as principal. The BHC has committed that the subsidiary will provide full and appropriate disclosure of its interest in the transaction as required by the securities laws, the National Association of Securities Dealers, and fiduciary principles.

The Board had previously authorized an underwriting subsidiary to provide full-service brokerage with respect to ineligible securities that it holds as principal, *but only to institutional customers* (1988 FRB 695). Applicant made the same commitments regarding disclosures as found in 1988 FRB 695. The BHC committed further that its subsidiary would prominently disclose in writing to each customer, at the commencement of the relationship, that it is not a bank; that it is separate from any affiliated bank; and that the securities sold, offered, or recommended by the subsidiary are not deposits, are not insured by the FDIC, are not guaranteed by an affiliated bank, and are not otherwise an obligation of an affiliated bank, unless such is in fact the case. The Board emphasized that confirmations sent to customers will state whether the subsidiary is acting as agent or principal with respect to a security. The Board concluded that such disclosure commitments would be adequate. It recognized that in performing the full-service brokerage activity, the underwriting subsidiary would be operating under a more extensive framework of prudential limitations than would be the case if the full-service brokerage activity were conducted by a bank, a subsidiary of a bank, or by another holding company subsidiary. Based on the commitments made, the Board decided on March 14, 1989, to approve the proposed activities (see 1989 FRB 396) subject to all the terms and conditions found in 1987 FRB 473, except for the market-share limitation.

Effective September 10, 1992, the Board added this nonbanking activity to the activities permitted by regulation, currently found in section 225.28(b)(7)(i) of Regulation Y and subject to the Board's disclosure and other requirements and the limitations on exchanging confidential information, as stated therein.

This section discusses and provides a historical reference of previous Board orders that initially authorized, by order, a bank holding company's acting as agent in the private placement of securities and engaging in riskless-principal nonbanking activities. *With the Board's incorporation of private-placement and riskless-principal activities into its adoption of changes to Regulation Y, effective April 21, 1997, the majority of the previous private-placement and riskless-principal commitments are not effective. Only those current requirements listed for private-placement and riskless-principal activities in section 225.28(b)(7) of Regulation Y (the laundry list of permissible nonbanking activities) should be used by the examiner in conducting the supervision and inspection of bank holding companies and their subsidiaries.*

3230.4.1 ENGAGING IN COMMERCIAL-PAPER PLACEMENT ACTIVITIES TO A LIMITED EXTENT

A bank holding company (the applicant) applied pursuant to section 4(c)(8) of the Bank Holding Company Act and section 225.23(a) of the Board's Regulation Y to act as an agent and adviser to issuers of commercial paper in connection with the placement of commercial paper with institutional purchasers. The commercial-paper-placement activity, as proposed, is to be conducted from a wholly owned commercial finance subsidiary (the company) of the applicant's direct subsidiary.

The Board concluded that the proposed commercial-paper-placement activity was so functionally and operationally similar to the role of a bank that arranges a loan participation or syndication as to be a proper incident thereto and that banking organizations are particularly well suited to perform the commercial-paper-placement function. The Board found that the proposal, as limited by the applicant, was consistent with section 20 of the Glass-Steagall Act, and could reasonably be expected to result in public benefits that would outweigh possible adverse effects. The Board found, further, that the applicant could conduct the proposed activities to the extent and in the manner described in the order. The Board's approval (1987 FRB 138) extended only to the activities conducted within the limitations proposed by the applicant for company and the BHC's subsidiary banks and other subsidiaries. The placement of commercial paper in any manner other than as described within the limitations and conditions of the order would not be within the scope of the Board's approval. The Board also required that no lending affiliate of the company would disclose to the company any nonpublic customer information concerning an evaluation of the financial condition of an issuer whose paper is placed by the company or of any other customer of the company, except as expressly required by securities law or regulation.

On May 25, 1988, the Board approved an order (1988 FRB 500) for a bank holding company to engage de novo, through a subsidiary, in acting as an agent and adviser to issuers of commercial paper in connection with the placement of commercial paper with institutional customers, as well as to engage in certain other securities and financial advisory activities. The applicant proposed to place commercial paper in accordance with all the terms and conditions of the above order (1987 FRB 138), except one. The applicant did not propose any quantitative limitations on its placement activity. The Board concluded that the proposed commercial-paper placement did not constitute underwriting or distributing under the Glass-Steagall Act and that the quantitative limitations on the activity were not necessary to ensure compliance with that act. (See section 3230.4.2, in which a subsidiary of a bank holding company was authorized to privately place all types of debt and equity securities.)

3230.4.2 ACTING AS AGENT IN THE PRIVATE PLACEMENT OF ALL TYPES OF SECURITIES AND ACTING AS RISKLESS PRINCIPAL

A bank holding company (the applicant) applied for the Board's approval to transfer the private-placement business of its commercial bank subsidiary to its designated nonbanking subsidiary for securities underwriting and dealing. The subsidiary would act as agent in the private placement of all types of securities, including the providing of related advisory services, and buy and sell all types of securities on the order of investors as a riskless principal.

Because the section 20 subsidiary would be affiliated through common ownership with a member bank, it may not be ‘‘principally engaged'' in the ''issue, flotation, underwriting, public sale, or distribution'' of securities within the meaning of the former section 20 of the Glass-Steagall Act. In an earlier decision (1989 FRB 751), the Board determined that a subsidiary is not engaged principally in section 20 activities if revenues from underwriting and dealing in securities that banks are not authorized to underwrite and deal in directly (bank-ineligible securities) do not exceed 10 percent of the subsidiary's gross revenues (25 percent, effective March 6, 1997). The applicant contended that the proposed private-placement and riskless-principal activities are not the kind of securities activities described in section 20 and, thus, should not be subject to the revenue limit on bank-ineligible securities activities.

The private-placement market involves the placement of new issues of securities with a limited number of sophisticated purchasers in a nonpublic offering. In private-placement transactions, a financial intermediary acts solely as agent of the issuer in finding purchasers. The intermediary does not purchase the securities and then try to resell them.

Privately placed securities are *not* subject to the registration requirements of the Securities Act of 1933. Such securities are only offered to financially sophisticated institutions and individuals,[1] not to the public. The applicant stated that all of the individuals with whom the securities would be placed will qualify as ''accredited investors'' under SEC rules. The Board concluded that the subsidiary's private placement of debt and equity securities within the limits proposed did not involve the underwriting or public sale of securities and that the revenues from the proposed activities should not be subject to the 10 percent revenue limitation (25 percent, effective March 6, 1997) on bank-ineligible securities activities.

The Board noted that other limitations on the activity should ensure that securities would not be offered to the public. First, the applicant agreed that the subsidiary would not make any general solicitation or advertisement to the public regarding the placement of particular securities. Second, the minimum denomination of securities to be placed would be $100,000. Third, the applicant agreed that the subsidiary would not privately place securities that are registered under the Securities Act of 1933 and that the subsidiary would be compelled to honor all provisions of that act, particularly those that limit the scope of private placements to nonpublic transactions. Fourth, the subsidiary agreed not to privately place as agent the securities of investment companies which are sponsored or advised by the applicant or its subsidiaries. Fifth, the subsidiary will not purchase or repurchase for its own account the securities being placed or will not inventory unsold portions of such securities. Sixth, the applicant further agreed to consult with its Federal Reserve Bank staff before transferring its private-placement activities from the subsidiary to any other nonbank subsidiary of the applicant to ensure that the transfer did not evade any of the firewall provisions committed to.

1. The subsidiary would not only place securities with institutional customers but with individuals whose net worth (or joint net worth with a spouse) exceeds $1 million. Such placement activities with individuals would not, in the Board's opinion, result in a public offering.

3230.4.3 INCORPORATION OF PRIVATE-PLACEMENT NONBANKING ACTIVITIES INTO REGULATION Y

The Board has added the activity of acting as agent in the private placement of securities to the laundry list of nonbanking activities (see 12 C.F.R. 225.28(b)(7)(ii)). Regulation Y adopts the definition of private-placement activities that is used by the SEC and the federal securities laws. In taking this action, the Board removed all but one restriction on private placement. The remaining restriction prohibits a bank holding company from purchasing for its own account the securities being placed or holding in inventory unsold portions of issues of these securities. This restriction prevents a bank holding company from classifying its securities underwriting activities as private-placement activities.

3230.4.4 RISKLESS PRINCIPAL

''Riskless principal'' is a broker-dealer that, after receiving an order to buy (or sell) a security from a customer, purchases (or sells) the security for its own account to offset a simultaneous sale to (or purchase from) the customer.

3230.4.4.1 Description of Riskless-Principal Transactions

When acting as a dealer, the securities firm maintains an inventory of securities for its own account and buys and sells securities as principal. Riskless-principal transactions are usually undertaken as an alternative method of executing orders by customers to buy or sell securities on an agency basis. In this situation, when a customer places an order to purchase securities that the broker-dealer does not maintain in its inventory, the firm must purchase the securities from a third party. At this point, the broker-dealer has the option of acting either as the agent for the customer or a riskless principal in making the purchase. If the decision is made to act as a riskless principal, the broker-dealer will purchase the securities from a third-party dealer at the dealer's ''inside price'' (confirming the transaction for its customer) and then, acting as principal, resell them to the customer, adding a markup over cost. If the broker-dealer does not complete the purchase of the securities ordered by the customer, it is not obligated to provide the securities.

3230.4.4.2 Underwriting and Riskless Principal

In riskless-principal transactions, the subsidiary would execute orders by an investor and would not act on behalf of an issuer of new securities. The subsidiary would not be involved in making any public offering of securities as agent for the issuer. Thus, these activities would not constitute underwriting for Glass-Steagall purposes.

3230.4.4.3 Summary of Board Action on Acting as Agent in Private Placement and as Riskless Principal in Buying and Selling Securities

The Board concluded that the securities underwriting and dealing of the subsidiary's riskless-principal activity did not constitute an underwriting of securities. The riskless-principal activity would not be a public sale or underwriting of securities and would not be viewed as a bank-ineligible securities activity for purposes of the current 25 percent revenue test. As a condition for the approval of the riskless-principal activity, the Board required the subsidiary to maintain specific records that would clearly identify such transactions so that examiners will be able to trace the resulting revenue. The riskless-principal activity was found to be closely related to banking. The Board further concluded that the placement activity differed only slightly in scope from those approved previously and that the operational limitations agreed to by the applicant would ensure that the subsidiary would not become involved in the public offering of any securities. The Board approved the application on October 30, 1989 (1989 FRB 829). (See also 1997 FRB 146; 1996 FRB 350, 748; 1995 FRB 49, 880, 1133; 1994 FRB 554, 1014; 1993 FRB 1166; 1992 FRB 294, 335, 552, 868; 1991 FRB 61; and 1990 FRB 26, 79, 545, 567, 568 (footnote 7), 653, 659, 663, 667, 672, 674, 766, 857, 864.)

3230.4.4.4 1996 Changes to the Underwriting Conditions for Riskless-Principal Activities

In connection with a bank holding company proposal considered by the Board on June 10, 1996, the Board reviewed the continued appropriateness of applying the underwriting conditions to the conduct of riskless-principal activities. In that case, the Board determined, based on its experience in monitoring and examining the conduct of riskless-principal activities by bank holding companies, that the underwriting conditions were not necessary to address identifiable adverse effects. Accordingly, the Board permitted the bank holding company to engage in riskless-principal transactions through a nonbank subsidiary without conducting this activity in accordance with the underwriting conditions (See 1996 FRB 748). The Board noted that riskless-principal transactions are essentially equivalent to securities brokerage transactions and, therefore, must be conducted in compliance with federal securities laws. The Board concluded that the definitional limitations (see section 225.28(b)(7)(ii) of Regulation Y) would be all that is needed to purchase (or sell) securities as a riskless principal. The conditions are designed to ensure that bank holding companies do not avoid the Glass-Steagall Act by classifying underwriting and dealing activities as riskless-principal activities. In the June 10 order, the bank holding company agreed that, if riskless-principal services were provided in combination with its advisory services, it would provide its customers with the disclosures established by the Board for full-service brokerage activities of bank holding companies. With respect to its decision, the Board decided to grant identical relief to other bank holding companies that had been previously approved to conduct riskless-principal nonbanking activities.

3230.4.4.5 Incorporation of Riskless-Principal Transactions into Regulation Y

As part of the Board's February 19, 1997, adoption of the final amendments to Regulation Y, it retained the requirement that riskless-principal transactions be conducted in the secondary market. It further determined to eliminate all but two restrictions with respect to riskless-principal transactions. A bank holding company may thus buy and sell in the secondary market all types of securities on the order of customers as a riskless principal, to the extent of engaging in a transaction in which the company, after receiving an order to buy (or sell) a security from a customer, purchases (or sells) the security for its own account to offset a contemporaneous sale to (or purchase from) the customer. This does not include—

1. selling bank-ineligible securities at the order of a customer that is the issuer of the securities, or selling in any transaction in which the bank holding company has a contractual agreement to place the securities as agent of the issuer; or
2. acting as riskless principal in any transaction involving a bank-ineligible security for which the bank holding company or any of its affiliates acts as an underwriter (during the period of the underwriting or for 30 days thereafter) or dealer. A bank holding company or its affiliates may not enter quotes for specific bank-ineligible securities in any dealer quotation system in connection with the bank holding company's riskless-principal transactions, except that the company or its affiliate may enter bid or ask quotations, or publish ‘‘offering wanted’’ or ‘‘bid wanted’’ notices on trading systems other than NASDAQ or an exchange, if the company or its affiliate does not enter price quotations on different sides of the market for a particular security for any two-day period. (See 12 C.F.R. 225.28(b)(7)(ii).)

A BHC applied for the Board's approval, pursuant to section 4(c)(8) and 225.23(a) of the Board's Regulation Y, to acquire, through a securities brokerage subsidiary, a 49 percent interest in a joint venture partnership. The applicant was a one-bank holding company formed over a bankers' bank. The shareholders comprised several hundred banks. The joint venture partnership (the company) proposed to engage in the activity of acting as a municipal securities brokers' broker.[1] This consisted of providing municipal securities brokerage services to other registered securities brokers and dealers, including dealer banks. The company would act as an undisclosed agent in the purchase and sale of municipal securities, including revenue bonds, for the account of its customers.

The applicant's proposal involved the purchase and sale of municipal securities as agent only and did not include dealing or otherwise taking a position in such securities. The activity fell within the third-party securities activities permitted for member banks under section 16 of the Glass-Steagall Act (12 U.S.C. 24), which allows banks to purchase and sell securities ''without recourse, solely upon the order, and for the account of, customers.'' National banks had been permitted to engage in the activity of acting as municipal securities brokers' brokers.

The Board found the activity to be functionally similar to the retail securities brokerage activities performed by banks for their customers as permitted under section 16 of the Glass-Steagall Act. The Board thus concluded that the activity was closely related to banking. The Board's approval of the order was based on several commitments made by the applicant and the other joint venturer. The Board approved the application by order on June 26, 1985 (1985 FRB 651).

1. Rule 15c3-1(a)(8)(ii) implementing section 15(c)(3) of the Securities and Exchange Act of 1934 defines a municipal securities brokers' broker as a ''municipal securities broker or dealer who acts exclusively as an undisclosed agent in the purchase or sale of municipal securities for a registered broker dealer or registered municipal securities dealer'' who has ''no retail customers'' and ''maintains no municipal securities in its proprietary or other accounts.'' Municipal securities brokers' brokers are subject to the federal securities laws applicable to securities brokers and are governed by the rules of the Municipal Securities Rulemaking Board.

Section 4(c)(8) of the BHC Act (Acting as a Conduit in Securities Borrowing and Lending) Section 3230.6

A foreign bank holding company (the applicant), and its wholly owned subsidiary (the company), a commercial banking organization located in New York state, applied pursuant to section 4(c)(8) of the BHC Act and section 225.23(a) of the Board's Regulation Y for prior approval to engage de novo on a domestic and international basis, through the company, in the following activities:

1. providing investment advisory services and financial advisory services, including advice regarding mergers, acquisitions, and capital-raising proposals by institutional customers, pursuant to section 225.28(b) of Regulation Y
2. providing securities brokerage services on an individual basis as well as in combination with investment advisory services (''full-service brokerage''), including exercising limited investment discretion on behalf of institutional customers
3. purchasing and selling all types of securities on the order of institutional and retail customers as a ''riskless principal''
4. engaging in securities credit activities under section 225.28(b)(6) of Regulation Y, including acting as a ''conduit'' or ''intermediary'' in securities borrowing and lending

The Board previously determined by regulation that engaging in the above-listed nonbanking activities (1) and (2) is closely related to banking under section 4(c)(8) of the BHC Act (see section 225.28(b)(6) and (7) of the Board's Regulation Y). The Board previously determined by order that, subject to certain prudential limitations, the proposed riskless-principal activities (item 3) are so closely related to banking as to be a proper incident thereto within the meaning of section 4(c)(8) of the BHC Act. The applicant has committed that the company will conduct its riskless-principal activities using the same methods and procedures and subject to the same prudential limitations established by the Board in its orders that are found at 1989 FRB 829 and 1990 FRB 26.

Banks and BHCs are permitted to borrow and lend securities held in their own portfolios (see the FFIEC's 1985 Supervisory Policy Statement on Securities Lending, *Federal Reserve Regulatory Service* 3–1579.5). In this case, the applicant proposed that the company borrow and lend the securities of noncustomer third parties. The company would seek out counterparties to securities borrowing and lending transactions and would assume much the same risk in these transactions as if it was borrowing or lending its own securities or its customers' securities. In this capacity, it would act as a ''conduit'' or ''intermediary'' in securities borrowing and lending. The company would supply—upon the request of another broker-dealer who is unable to obtain securities needed to satisfy customer or investment or operational needs—securities not available in the company's accounts or customer accounts by seeking out third-party noncustomer lenders. In addition to locating the securities, the company proposes to coordinate, on behalf of the borrower and lender, the exchange of securities and collateral that is necessary to the transaction.[1]

The Board, in its review of this application, believed that banks generally perform services that are operationally or functionally similar to the proposed conduit services. The proposed conduit activity was believed to be similar to the securities borrowing and lending activities that banks conduct. National and state banks are permitted to lend securities from their own portfolio, and with the customer's consent, from the accounts of customers, and banks regularly borrow securities to meet their needs and the needs of customers. The fact that a third party is substituted in place of a trust or other customer of a bank would not change significantly the way in which the securities lending activity would be conducted. The same steps and procedures that would be necessary to effectuate the loan of a customer's securities would be followed in loaning the securities of a noncustomer third party.

The risk associated with the proposed activity is the same risk that a bank would incur in managing the lending of securities from its own portfolio or the portfolio of a customer. The risk to the company, in acting as a conduit, is limited to ensuring that the collateral posted by the

1. The company agreed to coordinate this exchange through accounts established at a specifically named, privately held national clearinghouse for the settlement of transactions in corporate and municipal securities. Once the company had located the desired securities, the securities would be transferred to an account maintained by it at the clearinghouse and simultaneously delivered to an account of the borrower, also at that clearinghouse. At the same time, the borrower would be required to post collateral, which the company would receive into its clearinghouse account and simultaneously deliver to an account maintained by the lender at the clearinghouse.

borrower continuously reflects the market value of the securities loaned. The company committed to mark this collateral to market on a daily basis and to make calls for supplemental collateral where necessary.[2] The company also represented that it would not provide any indemnification to noncustomer third-party lenders of securities.

The Board determined, for the above reasons, that the proposed conduit activity is closely related to banking for the purposes of section 4(c)(8) of the BHC Act and approved the order on October 9, 1992 (1992 FRB 955).

The Board's approval was subject to the following specified conditions:

1. To minimize risk, the company is to act as a conduit only when the potential borrower and lender are matched before the transaction. In addition, it will take various measures to minimize operational risks, including conducting its conduit activities in accordance with the collateral requirements imposed on the borrowers by the Board's Regulation T.[3] A conduit transaction will commence only when a broker-dealer approaches the company and needs to borrow securities. Securities will not be borrowed in anticipation of a transaction.
2. At the end of each day, the company will mark to market the collateral posted by the borrower in all transactions in which it loaned securities or acted as an intermediary for a lender. As proposed, the company would establish credit lines for potential borrowers and lenders.[4]
3. The applicant committed that the company will conduct its conduit activities in compliance with the FFIEC Supervisory Policy Statement on Securities Lending (*Federal Reserve Regulatory Service* 3–1579.5).

2. If the price of the borrowed securities increases, the borrower is required under the Board's Regulation T to provide additional collateral to the company. The company, in turn, through transactions at the clearinghouse, will pass the collateral to the initial lender of the securities. If the borrower is unable to satisfy this requirement, the company is to have the contractual right to terminate the borrowing transaction by purchasing the securities in the open market and delivering them to the lender, who will then be obligated to return the borrower's collateral to the company. Because the borrowed securities will be marked to market daily by the company, the maximum exposure to the company in directly or indirectly borrowing or lending securities is one day's change in the price of the borrowed securities.

3. The applicant committed that the Board's Regulation T—which requires that all securities borrowing and lending transactions be collateralized by at least 100 percent of the value of the securities as computed on a daily basis—shall be the company's minimum guideline for posting collateral, and that the company will require many transactions to be collateralized in excess of 100 percent of the value of securities marked to market.

4. These credit policies are to include a review of all lenders and borrowers and the establishment of a credit committee that will determine limits on the credit exposure of any single borrower. The applicant proposed that the company would transact its business only with a select group of well-capitalized broker-dealers that will not be brokerage customers of the company.

The Board has authorized bank holding company subsidiaries to engage in investment or trading transactions as principal to underwrite and deal in certain securities and money market instruments that are eligible for bank underwriting and dealing by state member banks. Basically, the Board has subjected dealer subsidiaries to the same restrictions that govern underwriting and dealing by state member banks pursuant to 12 U.S.C. 24 and 335. Permissible activities include underwriting and dealing in type I securities as defined in 12 C.F.R. 1, including obligations of the United States, general obligations of states and their political subdivisions,[1] and type I municipal bonds; type II securities as defined in 12 C.F.R. 1, including, in part, municipal revenue obligations for housing, university, or dormitory purposes that do not qualify as type I securities; and banker's acceptances and certificates of deposit. In addition, such dealer subsidiaries are subject to the applicable capital restrictions (10 percent of the lead bank's capital and surplus) on dealing in type II securities in 12 C.F.R. 1.7. These underwriting and dealing activities were added to the permissible activities section of Regulation Y, effective February 6, 1984. Furthermore, dealer subsidiaries are permitted to furnish investment advice with respect to these bank-eligible securities.

The Board has authorized bank-affiliated securities dealers to underwrite, deal in, or privately place type III securities in separately capitalized nonbank subsidiaries subject to prudential limitations and restrictions to preclude such subsidiaries from being principally engaged in the underwriting and distribution of securities. In addition, the Board has authorized broker-dealer subsidiaries and brokerage subsidiaries to privately place any type of debt or equity security.

3240.0.1 HISTORY OF BOARD APPROVALS OF UNDERWRITING AND DEALING IN GOVERNMENT OBLIGATIONS AND MONEY MARKET INSTRUMENTS

On February 27, 1978, the Board approved an application to engage de novo in underwriting and dealing activities then being conducted by the bank holding company's only subsidiary bank. Thus, the formation of the subsidiary transferred these operations from the bank to the nonbank subsidiary. The activity included the underwriting and dealing in obligations of the United States and general obligations of various states and of political subdivisions. The Board determined that this activity is closely related to banking. The Board also approved, on February 27, 1978, another application of a bank holding company that would permit it to retain shares in a firm engaged in U.S. government securities underwriting activities.

On March 20, 1979, the Board approved an application of a bank holding company to acquire a company that would engage de novo in the activities of underwriting and dealing in certain government and municipal securities and in providing portfolio investment advice to individuals, associations, corporations, state and local governments, and financial institutions (''nonbank entities'') and to unaffiliated commercial banks. The Board determined that the proposed activities were closely related to banking.

On March 2, 1982, the Board approved an application of a bank holding company to form an incorporated securities company subsidiary that would engage de novo in the activities of soliciting, underwriting, dealing in, purchasing, and selling obligations of the United States, general obligations of various states, and money market instruments such as banker's acceptances and certificates of deposit. The Board regarded the government securities activities that the bank holding company proposed to engage in as substantially the same as the activities that the Board had approved in previous orders. Insofar as its proposal to deal in banker's acceptances, certificates of deposit, and other money market instruments that state member banks may from time to time be authorized to underwrite and deal in (such instruments are not regarded as ''securities'' subject to the prohibitions in sections 16 and 21 of the Glass-Steagall Act), the Board regarded such activities as closely related to banking because banks engage in such functions. The Board's approval of the bank holding company's application was subjected to the same restrictions and prudent limitations as if the activity were conducted in the affiliate's lead bank. For example, the nonbank subsidiary could not underwrite, deal in, or hold type II

1. The Gramm-Leach-Bliley Act authorized well-capitalized state member banks to deal in, underwrite, purchase, and sell all type I municipal securities and revenue bonds without any limitations relative to the bank's capital. See section 2020.1 of the *Commercial Bank Examination Manual* and SR-01-13.

securities of any issuer in amounts that would not be permitted if such activities were conducted by the subsidiary national bank, nor would it be permitted to sell securities to trust accounts of affiliated banks, except as permitted by regulations of the Comptroller of the Currency. Type II securities can consist of certain types of public housing and dormitory bonds of states and municipalities. The amount of such securities, of a single issue held by the bank, may not exceed 10 percent of the bank's capital and surplus (12 U.S.C 24 (seventh) and (12 C.F.R. 1.3(d)). The Board further ruled that any purchase of securities from the bank holding company's nonbank subsidiary by any of the bank holding company's subsidiary banks at other than current market values would constitute an unsafe or unsound practice.

3240.0.2 ADDING THE ACTIVITY TO REGULATION Y

Effective February 6, 1984, underwriting and dealing in U.S. government obligations and certain money market instruments was added to the list of permissible activities of Regulation Y. The regulation, which was amended in 1997, continues to place the same limitations as would be applicable if the activity were performed by the bank holding company's subsidiary member banks or its subsidiary nonmember banks as if they were member banks. (See Section 225.28(b)(8)(i) of Regulation Y.)

3240.0.3 REGULATION OF DEALER ACTIVITIES

While municipal securities dealers and dealers in government/agency securities are required to register as broker-dealers pursuant to the Securities Exchange Act of 1934, there are at present no registration requirements for firms that deal only in money market instruments. Regardless of whether a bank holding company subsidiary is registered as a broker-dealer with the Securities and Exchange Commission (SEC), Federal Reserve System examiners will conduct inspections to determine whether the subsidiary is in compliance with the provisions of Regulation Y or any specific conditions in a bank holding company order pertaining to the organization under inspection. In addition, examiners will need to focus on financial, managerial, and safety-and-soundness considerations in any bank holding company dealer subsidiary. In the event a firm is a registered broker-dealer subject to examination by the National Association of Securities Dealers (NASD), the inspection should be designed to prevent duplication of effort, relying on work performed by NASD examiners to the greatest extent possible, yet still evaluate the factors discussed above that are relevant for either registered or unregistered dealers.

Effective May 20, 1985, the Federal Reserve Bank of New York adopted a *Capital Adequacy Guideline for U.S. Government Securities Dealers*. The Federal Reserve Bank of New York recommends that U.S. government securities dealers that are not subject to federal oversight agree to comply voluntarily with the capital adequacy guideline. Hence, it is expected that any government securities dealer subject to System inspection will comply with the SEC's Uniform Net Capital Rule (17 C.F.R. 240.15c3-1).

3240.0.4 DEALER ACTIVITIES

A firm operates as a dealer when it underwrites or deals in securities or money market instruments. Those activities are usually distinguished as separate activities from normal investment activities. If the firm holds itself out to other dealers or investors as a dealer or engages in a repetitive pattern of short-term purchases and sales, the firm may be engaged in dealer activities, regardless of its stated investment activities.

As noted previously, when the Board added to the Regulation Y list of permissible activities the activities of underwriting and dealing in U.S. government securities, certain money market instruments, and municipal securities, the Board added a restriction that such nonbank activities be subject to the same restrictions as securities and money market instrument activities of member banks. Accordingly, the following discussion focuses upon *permissible securities activities of all member banks.*

3240.0.5 GOVERNMENT AND MUNICIPAL SECURITIES

The authority under which a bank may engage in securities trading and underwriting is found in section 5136 of the Revised Statutes (12 U.S.C. 24). That authority is restricted by limitations on percentage holding of classes of securities as found in 12 C.F.R. 1.3. That regulation allows banks to deal in, underwrite, purchase, and sell type I securities without limit and type II securities limited to 10 percent of its capital and unimpaired surplus. Banks are prohibited from underwriting or dealing in type III securities for their own accounts. (See section 2020.1 of the *Commercial Bank*

Examination Manual for further information on type I, II, and III securities.)

There are three major types of securities transactions in which banks are involved. First, the bank may buy and sell securities on behalf of a customer. Those are agency transactions in which the agent (bank) assumes no substantial risk and is compensated by a prearranged commission or fee. Second, as a dealer, the bank buys and sells securities for its own account. That is termed a principal transaction because the bank is acting as a principal, buying or selling qualified securities through its own inventory and absorbing whatever market gain or loss is made on the transaction. The third type of securities transaction frequently executed by banks is a contemporaneous ''riskless-principal trade.'' The dealer buys and sells qualified securities as a principal, with the purchase and sale originating almost simultaneously. Exposure to market risks is limited by the brief period of actual ownership, and profits result from dealer-initiated markup, the difference between the purchase and sale prices.

Dealers' securities transactions involve customers and other securities dealers. The word ''customer,'' as used in this section, means an investor. Transactions with other dealers are not considered customer transactions unless the dealer is buying or selling for investment purposes. The following subsections include general descriptions of significant areas of permissible trading and underwriting activities.

3240.0.6 U.S. GOVERNMENT SECURITIES TRADING

U.S. government security trading inventories are generally held with the objective of making short-term gains through market appreciation and dealer-initiated markups. The size of a transaction, the dealer efforts extended, and the nature of the security are common factors that affect the markup differential. Markups on government securities generally range between one and four thirty-seconds of a point. Long maturity issues may have higher markups.

The market risk inherent in U.S. government trading portfolios should be controlled by policy. Standards should be established to limit the total securities inventory and the amount of securities with similar yield or maturity characteristics. Limits imposed by policy should include commitments to purchase new governments on a when-issued basis.

Payments for and deliveries of U.S. government and most agency securities are settled on the business day following the trade. Government dealers and customers can negotiate same-day or delayed settlement for special situations, but the industry recognizes standard settlement as occurring on the trade date plus one business day.

3240.0.6.1 ''When-Issued'' Trading

A significant source of risk to dealers involves ''when-issued'' (WI) trading in government securities. WI trading is the buying and selling of securities in the one- to two-week interim between the announcement of an offering and the security issuance and payment date. The Dealer Surveillance Staff at the Federal Reserve Bank of New York began to require WI position reports from primary government securities dealers and request voluntary WI reports from certain other government securities dealers in 1984. At the time the reporting requirements were adopted, a senior official stated, ''The opportunity to trade with several dealers simultaneously without making payment could result in trading losses which exceed a participant's ability to settle.'' In essence, the fact that settlement date can extend to almost two weeks—as opposed to the ordinary next-day settlement—presents an opportunity for firms to engage in a large volume of trading without drawing on the firm's ability to purchase securities or effect delivery against short positions. Hence, there is increased credit risk in such transactions. Consequently, the dealer's trading position limits should include WI limits to protect against the increased credit risk associated with WI trading.

3240.0.6.2 Due Bills

A ''due bill'' is an obligation that results when a firm sells a security or money market instrument and receives payment, but does not deliver the item sold. Due bills issued should be considered as borrowings by the issuing firm, and, alternatively, due bills received should be considered as lending transactions.

Registered broker-dealers are subject to the SEC's rule 15c3-3 (17 C.F.R. 240.15c3-3), ''Customer Protection—Reserves and Custody of Securities.'' Basically, this rule states the principle that a broker-dealer needs to safeguard customer assets and cannot use such assets to fund its own business activities. While this rule is not directly applicable to unregistered U.S. government securities or money market instrument dealers, the principle is transferable. Dealers should not issue due bills as a means of obtaining operating funds or where the underlying security can be delivered at settlement. Customers of the dealer enter transactions with an implicit understanding that securities transactions will be promptly executed and settled unless there is a clear understanding to the contrary. Consequently, dealers should promptly disclose the issuance of a due bill to a customer when funds are taken but securities or money market instruments are not delivered to the customer. Such disclosure should reference the applicable transaction; state the reason for the creation of a due bill; describe the collateral, if any, securing the due bill; and indicate that to the extent the market value of the collateral is insufficient, the customer may be an unsecured creditor of the dealer.

3240.0.6.3 Clearance

Securities clearance services for the bulk of U.S. government and federal-agency security transactions are provided by the Federal Reserve as part of its telegraphic securities transfer system. The various Federal Reserve Banks will wire transfer most government securities between the book-entry safekeeping accounts of the seller and buyer. The Federal Reserve's systems also are used to facilitate security borrowings, loans, and pledges. Hence, the securities firm will need to use the services of a clearing bank.

3240.0.6.4 Short Sales

Another area of U.S. government security activity involves short-sale transactions. A short sale is the sale and delivery of a security that the seller does not own. It is accomplished by borrowing the security for delivery. The borrowed security is collateralized by an appropriate amount of a similar security. Short sales are conducted to accommodate customer orders, to obtain funds by leveraging existing assets, to hedge the market risk of other assets, or with the expectation that the market price of the sold security will decline sufficiently to allow the bank to complete the transaction by purchasing an equivalent security at a later date and a lower price.

3240.0.6.5 Arbitrage

Arbitrage is the coordinated purchase and sale of two securities or of a security and a futures or options contract in which there is a relative market imbalance. The objective of such activity is to obtain earnings by taking advantage of changing yield spreads. Arbitrage opportunities take many forms and can exist whenever segments of the securities markets are subject to a yield variance.

Exposure on arbitrage and/or short sales should be closely monitored for compliance with predetermined objectives. Risk should be controlled by point-spread limits coordinated with stop-loss buy provisions or sell provisions and by guidelines on the length of time a short position can remain uncovered.

3240.0.7 MONEY MARKET TRADING

Aside from short-term securities, banks customarily trade a substantial volume of other money market instruments such as banker's acceptances. It should be noted that the Supreme Court has opined that commercial paper is a Glass-Steagall security.

3240.0.7.1 Banker's Acceptances

Banker's acceptances are an obligation of the acceptor bank and an indirect obligation of the drawer. They are normally secured by rights to the goods being financed and are available in a wide variety of principal amounts. Maturities are generally less than nine months. Acceptances are priced like Treasury bills, with a discount figured for the actual number of days to maturity based on a 360-day year.

3240.0.7.2 Certificates of Deposit

Negotiable certificates of deposit (CDs) issued by money-center banks are actively traded in denominations of $100,000 to $1 million. Interest generally is calculated on a 360-day year and paid at maturity. Secondary market prices are computed based on current yield, net of accrued interest due the seller. Eurodollar CDs trade like domestic CDs except their yields are usually higher and their maturities often longer.

Money market instruments trade with the same-day or one-day settlement. Publicly quoted yields or dollar prices are usually based on round lot trades of $1 million, except for commercial paper, which trades in round lots of $250,000. Odd-lot prices may vary, but because of the large dollar volume of most trades, the percentage spread between the acquisition cost and sale price is characteristically modest.

Management should attempt to minimize market risk by establishing a maximum holding limit for each class of money market instrument. Policy guidelines also should establish concentration limits for money market instruments issued by a single obligor. Such limits should include commitments.

A sound money market trading policy recognizes the need for a qualitative analysis of the issuers of instruments. Credit approvals should be obtained before trading in CDs and acceptances, and reviews should be conducted on a regular schedule.

Banks dealing in money market instruments are subject to a number of legal restrictions. The sale of federal funds by a member bank to a bank affiliate is limited under section 23A (12 U.S.C. 371(c)) and subject to the restrictions of section 23B of the Federal Reserve Act (12 U.S.C. 371(c-1)). The acquisition, as principal, of a certificate of deposit issued by an affiliate bank also is subject to section 23A limitations and section 23B restrictions. These restrictions do not apply to transactions between bank subsidiaries that are 80 percent or more commonly owned by a bank holding company. These transactions must be conducted on terms that are consistent with safe and sound banking practices.

3240.0.8 REPURCHASE AGREEMENTS AND SECURITIES LENDING

The overwhelming majority of a government security dealer's inventory is financed by repurchase agreements. In addition, many dealers operate a ‘‘matched book’’ repo operation whereby they finance the acquisition or carrying of securities by customers through reverse repurchase agreements and contemporaneously obtain funding for such transactions through the sale of the same or similar securities under a repurchase agreement. In addition, securities dealers often lend or borrow specific issues to effect delivery against short positions or because of failure to receive securities required to be delivered. For prudential guidelines that have been issued to financial institutions in connection with repurchase agreements and securities lending, see the FFIEC supervisory policy statements at sections 2140.0 and 2150.0, which have been adopted by the Federal Reserve Board.

Firms enter into ‘‘reverse repos’’ to finance the U.S. government securities inventory of other dealers or mortgage bankers who have originated pools of mortgages to back federal housing agency securities. Repos are sold to customers in lieu of certificates of deposit. Customers find them attractive because interest can be paid on repos having maturities of less than seven days and because customer funds are collateralized by the security underlying the repurchase transaction.

The rate of interest received and paid is generally dictated by prevailing market rates. Profits are based on a modest positive spread between interest earned and interest paid. A dealer may attempt to improve that modest profit by increasing the volume of such transactions, using the proceeds to finance or pyramid the acquisition of reverse repos or securities to be used in additional repo arrangements.

A common dealer strategy is to vary resale and repurchase maturities in anticipation of interest-rate movements. If an upward rate trend is expected, the dealer will attempt to lock in a cheaper source of funds at the current low rate by negotiating longer maturities for repos and shorter maturities for reverse repos. Conversely, if interest rates are expected to decline, the dealer attempts to negotiate longer-maturity reverse repos to ensure continuing higher earnings, while negotiating shorter-maturity repos to take advantage of cheaper future sources of funds. Care should be taken to limit exposure by instituting policy guidelines that—

1. limit the aggregate amounts of reverse repo and repo positions,
2. specify acceptable amounts of funds for unmatched or extended maturity transactions,
3. determine maximum time gaps for unmatched maturity transactions and minimally acceptable interest-rate spreads for various maturity agreements, and
4. follow the prudential guidelines in the FFIEC's policy statement on repurchase agreements and securities lending. (See sections 2140.0 and 2150.0.)

3240.0.9 POLICY SUMMARY

The legal responsibilities of directors require that they ensure that dealer activities are conducted on a sound and legal basis that can only be accomplished if the directors endorse a written trading policy that addresses each area of market and legal risk. Written policy guidelines should be distributed to each individual engaged in trading activities.

3240.0.10 SCOPE OF THE INSPECTION

The scope of inspection will vary depending on the types of securities or money market instrument underwriting, dealing, and brokerage activities conducted by the subsidiary. Examiners may encounter situations in which a securities subsidiary is an SEC-registered broker-dealer because the subsidiary also executes transactions in municipal securities.

Registered broker-dealers are required to become members of the NASD or some other ‘‘self-regulatory organization.’’ To avoid unnecessary regulatory overlap, examiners can rely on the NASD's compliance examination with respect to investor protection, including compliance with rules of the SEC, NASD, and Municipal Securities Rulemaking Board (MSRB), and the Board's Regulation T governing securities credit (if applicable). Consequently, in commencing such an inspection, examiners should begin by requesting and reviewing the NASD's most recent examination letter to the broker-dealer and serious violations that could endanger the banking organization (for example, fraudulent activities that could subject the organization to losses or lawsuits). Significant violations that have not yet been corrected should be noted in the bank holding company report.

Federal Reserve examiners retain responsibility for inspecting certain areas of registered broker-dealer operations regardless of whether the NASD reviews them. Specifically, System examiners should still evaluate management, financial results, and safety-and-soundness considerations, including internal controls. In addition, examiners still need to verify that registered broker-dealer subsidiaries comply with the provisions of Regulation Y, section 225.28(b)(8)(i), or specific Board orders pertaining to the firm under inspection. Finally, the examiner should be prepared to review in-depth any activities or money market instruments that are not securities that might not have been reviewed by the NASD because the activities are outside their scope of examination.

3240.0.11 INSPECTION OBJECTIVES

1. To determine if the policies, practices, procedures, and internal controls regarding dealer activities are adequate.
2. To determine if officers are operating in conformance with the established guidelines.
3. To evaluate the trading portfolio for credit quality and marketability.
4. To determine the scope and adequacy of the audit-compliance functions.
5. To determine compliance with applicable laws and regulations, including 12 C.F.R. 225.28(b)(8)(i).
6. To ensure investor protection.
7. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of law or regulation have been noted.

3240.0.12 INSPECTION PROCEDURES

1. Review the adequacy of the dealer's internal controls. (See section 3240.0.13.)
2. Based on the evaluation of internal controls and the work performed by internal/external auditors, determine the scope of the inspection.
3. Test for compliance with policies, practices, procedures, and internal controls in conjunction with performing the remaining procedures. Also, obtain a listing of any deficiencies noted in the latest review done by internal/external auditors from the examiner assigned ‘‘Internal and External Audits,’’ and determine if corrections have been accomplished.
4. Obtain a copy of the latest letter received from the self-regulatory organization responsible (if applicable) for examining broker-dealer activities of this subsidiary.
5. Request that the firm provide the following schedules:
   a. aged schedule of securities that have been acquired as a result of underwriting activities
   b. aged schedule of trading-account securities and money market instruments held for trading or arbitrage purposes, which should reflect commitments to purchase and sell securities and all joint-account interests
   c. schedule of short-sale transactions
   d. aged schedule of due bills
   e. list of bonds borrowed
   f. aged schedule of ‘‘fails’’ to receive or deliver securities on unsettled contracts

g. schedule of approved securities borrowers and approved limits
h. schedule of loaned securities
i. schedule detailing account names and/or account numbers of the—
   - affiliated banks' permanent portfolio accounts;
   - personal accounts maintained at the firm by its employees;
   - accounts of brokers or other dealers; and
   - personal accounts of employees of other brokers, dealers, or municipal securities dealers
j. list of all joint accounts entered into since the last examination
k. list of underwriting since the last examination and whether such securities were acquired by negotiation or competitive bid
l. list of all financial advisory relationships

6. Compare balances of appropriate schedules to the general ledger and review reconciling items for reasonableness.
7. Determine the extent and effectiveness of trading-policy supervision by—
   a. reviewing the abstracted minutes of meetings of the board of directors and/or of any appropriate committee,
   b. determining that proper authorization for the trading officer or committee has been made,
   c. ascertaining the limitations or restrictions on delegated authorities,
   d. evaluating the sufficiency of analytical data used in the most recent board or committee trading-department review,
   e. reviewing the methods of reporting by department supervisors and internal auditors to ensure compliance with established policy and law, and
   f. reaching a conclusion about the effectiveness of director supervision of the trading policy. Prepare a memo for the examiner assigned ''Duties and Responsibilities of Directors'' stating your conclusions. All conclusions should be supported by factual documentation.

(Before continuing, refer to steps 14 and 15. They should be performed in conjunction with the remaining examination steps.)

8. Ascertain the general character of underwriting and direct-placement activities and ascertain the effectiveness of department management by reviewing underwriter files and ledgers, committee reports, and offering statements to determine—
   a. the significance of underwriting activities and direct placements of securities as reflected by the volume of sales and profit or loss on operations (compare current data to comparable prior periods);
   b. whether there is a recognizable pattern in—
      - the extent of analysis of material information relating to the ability of the issuer to service the obligation,
      - rated quality of offerings,
      - point spread of profit margin for unrated issues,
      - geographic distribution of issuers, and
      - syndicate participants, and
   c. the volume of outstanding bids. Compare current data to comparable prior periods.
9. Determine the general character of trading-account activities and whether the activities are in conformance with stated policy by reviewing departmental reports, budgets, and position records for various categories of trading activity and determining—
   a. the significance of present sales volume compared to comparable prior periods and departmental budgets;
   b. whether the firm's objectives are compatible with the volume of trading activity;
   c. significant inventory positions taken since the prior examination and determining if—
      - the quality and maturity of the inventory position was compatible with prudent practices, and
      - the size of the position was within prescribed limits and compatible with a sound trading strategy
   d. the exposure on offsetting repurchase transactions by—
      - reviewing the maturities of offsetting ''repo'' and ''reverse repo'' agreements to ascertain the existence, duration, amounts, and strategy used to manage unmatched maturity ''gaps'' and extended (over 30 days) maturities;
      - reviewing records since the last inspection to determine the aggregate amounts of—
        — matched repurchase transactions and
        — ''reverse repo'' financing extended to one or related firms(s); and
      - performing credit analyses of significant concentrations with any single or related entities.

10. Determine the extent of risk inherent in trading-account securities which have been in inventory in excess of 30 days.
    a. Determine the dollar volume in extended holdings.
    b. Determine the amounts of identifiable positions with regard to issue, issuer, yield, credit rating, and maturity.
    c. Determine the current market value for individual issues which show an internal valuation markdown of 10 percent or more.
    d. Perform credit analyses on the issuers of nonrated holdings identified as significant positions.
    e. Perform credit analyses on those issues with valuation writedowns considered significant relative to the scope of trading operations.
    f. Discuss plans for disposal of slow-moving inventories with management and determine the reasonableness of those plans in light of current and projected market trends.
11. Using an appropriate technique, select issues from the schedule of trading-account inventory. Test valuation procedures by—
    a. reviewing operating procedures and supporting workpapers and determining if prescribed valuation procedures are being followed;
    b. comparing dealer-prepared market prices, as of the most recent valuation date, to an independent pricing source (use trade date ‘‘bid’’ prices); and
    c. investigating any price differences noted.
12. Using an appropriate technique, select transactions from the schedule of short sales and determine—
    a. the degree of speculation reflected by basis-point spreads,
    b. present exposure shown by computing the cost to cover short sales, and
    c. if transactions are reversed in a reasonable period of time.
13. Analyze the effectiveness of operational controls by reviewing recent cancellations and fail items (fail to receive securities and fail to deliver securities) that are a week or more beyond settlement date and determine—
    a. the amount of extended fails,
    b. the planned disposition of extended fails,
    c. if the control system allows a timely, productive follow-up on unresolved fails,
    d. the reasons for cancellations, and
    e. the planned disposition of securities that have been inventoried before the recognition of a fail or a cancellation.
14. Determine compliance with applicable laws, rulings, and regulations by performing the following:
    a. *12 C.F.R. 1.3—eligible securities.*
        - Review inventory schedules of underwriting and trading accounts and determine if issues whose par value is in excess of 10 percent of the affiliated lead bank’s capital and unimpaired surplus are type I securities.
        - Determine that the total par value of type II investments does not exceed 10 percent of the affiliated lead bank’s capital and unimpaired surplus, based on the combination of holdings and permanent portfolio positions in the same securities.
        - Elicit management’s comments and review underwriting records on direct placement of type II securities and determine if the broker-dealer is dealing or engaging in impermissible direct placement of type III securities.
    b. *Sections 23A and 23B of the Federal Reserve Act (12 U.S.C. 371(c) and 375)—preferential treatment.* Obtain a list of domestic affiliate relationships and a list of directors and principal officers and their business interests from appropriate examiners and determine whether transactions, including securities-clearance services, involving affiliates, insiders, or their interests are on terms less favorable to the bank than those transactions involving unrelated parties.
15. Test for unsafe and unsound practices and possible violations of the Securities Exchange Act of 1934 by—
    a. reviewing transactions, including U.S. government tender-offer subscription files, involving employees and directors of dealer or other banks, and determining if the funds used in the transactions were misused bank funds or the proceeds of reciprocal or preferential loans,
    b. reviewing sales to affiliated companies to determine that the sold securities were not subsequently repurchased at an additional markup and that gains were not recognized a second time,
    c. reviewing securities position records and customer ledgers with respect to large-volume repetitive purchase and sales transactions and—

  - independently testing market prices of significant transactions which involve the purchase and resale of the same security to the same or related parties, and
  - investigating the purchase of large blocks of securities from dealer firms just prior to month-end and their subsequent resale to the same firm just after the beginning of the next month
  d. reviewing customer-complaint files and determining the reasons for such complaints.
16. Discuss with an appropriate officer and prepare report comments concerning—
  a. the soundness of trading objectives, policies, and practices;
  b. the degree of legal and market risk assumed by trading operations;
  c. the effectiveness of analytical, reporting, and control systems;
  d. violations of law;
  e. internal control deficiencies;
  f. apparent or potential conflicts of interest; and
  g. other matters of significance.
17. Reach a conclusion regarding the quality of department management and state your conclusions on the appropriate inspection report pages.
18. Update workpapers with any information that will facilitate future inspections.

3240.0.13 REVIEW OF INTERNAL CONTROLS

As a part of carrying out the inspection procedures for this activity, the examiner is expected to review the dealer's system of internal controls. The examiner should concentrate the internal controls review on the policies, practices, and procedures of the firm.

The system should be documented in a complete, concise manner and should include, where appropriate, narrative descriptions, flow charts, copies of forms used, and other pertinent information. *Items marked with asterisks require substantiation by observation or testing.*

3240.0.13.1 Securities Underwriting Trading Policies

1. Has the board of directors, consistent with its duties and responsibilities, adopted written securities underwriting/trading policies that—
  a. outline objectives?
  b. establish limits and/or guidelines for the following:
    - price markups?
    - quality of issues?
    - maturity of issues?
    - inventory positions (including when-issued (WI) positions)?
    - amounts of unrealized loss on inventory positions?
    - length of time an issue will be carried in inventory?
    - amounts of individual trades or underwriter interests?
    - acceptability of brokers and syndicate partners?
  c. recognize possible conflicts of interest and establish appropriate procedures regarding—
    - deposit and service relationships with municipalities whose issues have underwriting links to the trading department?
    - deposit relationships with securities firms handling significant volumes of agency transactions or syndicate participations?
    - transfers made between trading-account inventory and affiliated investment portfolio(s)?
    - the affiliated bank's trust department acting as trustee, paying agent, and transfer agent for issues which have an underwriting relationship with the trading department?
  d. state procedures for periodic, monthly or quarterly, valuation of trading inventories to market value?
  e. state procedures for periodic independent verification of valuations of the trading inventories?
  f. outline methods of internal review and reporting by department supervisors and internal auditors to ensure compliance with established policy?
  g. identify permissible types of securities?
2. Are the underwriting/trading policies reviewed at least quarterly by the board of directors to determine their adequacy in light of changing conditions?
3. Is there a periodic review by the board to ensure that the underwriting/trading department is in compliance with its policies?

3240.0.13.2 Offsetting Resale and Repurchase Transactions

1. Has the board of directors, consistent with its duties and responsibilities, adopted written

offsetting repurchase transaction policies that—
  a. limit the aggregate amount of offsetting repurchase transactions?
  b. limit the amounts in unmatched or extended (over 30 days) maturity transactions?
  c. determine maximum time gaps for unmatched maturity transactions?
  d. determine minimally acceptable interest-rate spreads for various maturity transactions?
  e. determine the maximum amount of funds to be extended to any single or related firms through "reverse repo" transactions involving unsold (through forward sales) securities?
  f. require firms involved in reverse repo transactions to submit corporate resolutions stating the names and limits of individuals who are authorized to commit the firm?
  g. require submission of current financial information by firms involved in reverse repo transactions?
  h. provide for periodic credit reviews and approvals for firms involved in reverse repo transactions?
  i. specify types of acceptable offsetting repurchase transaction collateral?
  j. require receipt of assurance letters that unregulated securities dealers comply with the Federal Reserve Bank of New York's "Capital Adequacy Guideline for U.S. Government Securities Dealers?"
2. Are written collateral-control procedures designed so that—
  a. collateral assignment forms are used?
  b. collateral assignments of registered securities are accompanied by powers of attorney signed by the registered owner, and are registered securities registered in the dealer or dealer's nominee name when they are assigned as collateral for extended maturity (over 30 days) reverse repo transactions?
  c. funds are not disbursed until reverse repo collateral is delivered into the physical custody of the dealer or an independent safekeeping agent?
  d. funds are only advanced against predetermined collateral margins or discounts?
  e. collateral margins or discounts are predicated upon the following:
    • the type of security pledged as collateral?
    • maturity of collateral?
    • historic and anticipated price volatility of the collateral?
    • creditworthiness of the counterparty?
    • maturity of the reverse repo agreements?
    • accrued interest?
  f. maintenance agreements are required to support predetermined collateral margin or discount by daily mark to market of repurchase agreement securities?
  g. maintenance agreements are structured to allow for obtaining additional securities or cash calls in the event of collateral price declines?
  h. collateral market value is frequently checked to determine compliance with margin and maintenance requirements?

3240.0.13.3 Custody and Movement of Securities

*1. Are the dealer's procedures such that persons do not have sole custody of securities in that—
  a. they do not have sole physical access to securities?
  b. they do not prepare disposal documents that are not also approved by authorized persons?
  c. for the security custodian, supporting disposal documents are examined or adequately tested by a second custodian?
  d. no person authorizes more than one of the following transactions: execution of trades, receipt and delivery of securities, and collection or disbursement of payment?
2. Are securities physically safeguarded to prevent loss, unauthorized disposal, or use?
  a. Are negotiable securities kept under dual control?
  b. Are securities counted frequently on a surprise basis and reconciled to the securities record? Are the results of such counts reported to management?
  c. Does the dealer periodically test for compliance with provisions of its insurance policies regarding custody of securities?
  d. For securities in the custody of others—
    • are custody statements agreed periodically to position ledgers, and any differences followed up to a conclusion?

- are statements received from brokers and other dealers reconciled promptly, and any differences followed up to a conclusion?
- are positions for which no statements are received confirmed periodically, and stale items followed up to a conclusion?

3. Are trading-account securities segregated from other dealer-owned securities or securities held in safekeeping for customers?
*4. Is access to the trading-securities vault restricted to authorized employees?
5. Do withdrawal authorizations require countersignature to indicate security count verifications?
6. Is registered mail used for mailing securities, and are adequate receipt files maintained for such mailings (if registered mail is used for some but not all mailings, indicate criteria and reasons)?
7. Are prenumbered forms used to control securities trades, movements, and payments?
8. If so, is numerical control of prenumbered forms accounted for periodically by persons independent of those activities?
9. Do alterations to forms governing the trade, movement, and payment of securities require—
   *a. signature of the authorizing party?
   b. use of a change-of-instruction form?
10. With respect to negotiability of registered securities—
    a. are securities kept in non-negotiable form whenever possible?
    b. are all securities received and not immediately delivered transferred to the name of the dealer or its nominee and kept in non-negotiable form whenever possible?
    c. are securities received checked for negotiability (endorsements, signature, guarantee, legal opinion, etc.) and for completeness (coupons, warrants, etc.) before they are placed in the vault?

3240.0.13.4 Purchase and Sales Transactions

1. Are all transactions promptly confirmed in writing to the actual customers or dealers?
2. Are confirmations compared or adequately tested to purchase and sales memoranda and reports of execution of orders, and any differences investigated and corrected (including approval by a designated responsible employee)? Are confirmations and purchase and sale memoranda checked or adequately tested for computation and terms by a second individual?
3. Are comparisons received from other dealers or brokers compared with confirmations, and any differences promptly investigated? Are comparisons approved by a designated individual?

3240.0.13.5 Customer and Dealer Accounts

1. Do account bookkeepers periodically transfer to different account sections or otherwise rotate posting assignments?
2. Are letters mailed to customers requesting confirmation of changes of address?
3. Are separate customer-account ledgers maintained for—
   a. employees?
   b. affiliates?
   c. affiliated bank's trust accounts?
4. Are customer inquiries and complaints handled exclusively by designated individuals who have no incompatible duties?

3240.0.13.6 Other

1. Are the preparation, additions, and posting of subsidiary records performed and/or adequately reviewed by persons who do not also have sole custody of securities?
2. Are subsidiary records reconciled, at least monthly, to the appropriate general-ledger accounts, and are reconciling items adequately investigated by persons who do not also have sole custody of securities?
3. Are fails to receive and deliver under a separate general-ledger control?
   a. Are fail accounts periodically reconciled to the general ledger, and any differences followed up to a conclusion?
   b. Are periodic aging schedules prepared?
   c. Are stale fail items confirmed and followed up to a conclusion?
   d. Are stale items valued periodically, and, if any potential loss is indicated, is a particular effort made to clear such items or to protect the bank from loss by other means?
4. With respect to securities loaned and borrowed positions—

a. are details periodically reconciled to the general ledger, and any differences followed up to a conclusion?
b. are positions confirmed periodically?
c. are all policies and procedures in conformance with the FFIEC policy on securities lending contained section 2140.0?

3240.0.14 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*

4(c)(8)—Agency Transactional Services (Futures Commission Merchants and Futures Brokerage) Section 3250.0

A futures commission merchant (FCM) is an entity referred to in the Commodity Exchange Act to denote a registered firm that is in the business of soliciting or accepting orders, as broker, for the purchase or sale of any exchange-traded futures contract and options thereon. For the purposes of this examiner guidance, the term ‘‘FCM activities’’ is used in a broad context and refers to all futures brokerage activities, operations, and their associated risks that are subject to the Federal Reserve System's supervision (see SR-97-33). In connection with these activities, banking organizations may hold customer funds, assets, or property and may be members of futures exchanges and their associated clearinghouses. They may also offer related advisory services as registered commodity trading advisers (CTAs). The guidance addresses the expanding scope of futures activities conducted by different types of banking organizations worldwide, and implements supervisory initiatives to effect more risk-focused and burden-sensitive approaches to the supervision of FCM activities. The guidance is designed to assist examiners in assessing how well a consolidated financial organization manages one or more discrete futures brokerage operations, as well as in making a broader assessment of the organization's overall risk management.

The guidance pertains to FCM subsidiaries of bank holding companies (BHCs), but it is also applicable to FCM subsidiaries of state member banks, Edge Act corporations, and foreign banking organizations. It addresses the broader scope of permissible futures brokerage activities articulated within Regulation Y,[1] and by extension in Regulation K, and focuses on the adequacy of management and the management processes used to control the credit, market, liquidity, reputation, and operations risks entailed in these activities, including brokerage, clearing, funds management, and advisory services.

The guidance takes a global line-of-business supervisory approach to the inspection of FCM activities rather than the traditional full-scope inspections of individual FCM subsidiaries, many of which are primarily supervised by functional regulators. Reviews and reports of functional regulators should be used to the fullest extent when planning and conducting inspections of FCM activities of bank holding companies and other banking organizations to avoid duplication and minimize supervisory burdens. However, in conducting an inspection of various aspects of an FCM's activities, a review of various functions, derived from a sample of the organization's FCM subsidiaries, may be necessary and appropriate to determine the extent of the risks these operations pose to the banking organization and to determine whether management of those risks is satisfactory. The examiner should pay particular attention to activities conducted in FCM subsidiaries that have not been subject to a regular inspection by their functional regulator and to FCM activities of foreign affiliates in which there is uncertainty concerning the level of local supervision.

BHC subsidiaries, banks (generally through operating subsidiaries), Edge Act corporations, and foreign banking organizations (FBOs) operating in the United States may operate futures brokerage and clearing services involving a myriad of financial and nonfinancial futures contracts and options on futures. These activities can involve futures exchanges and clearinghouses throughout the world. In general, most organizations conduct these activities as FCMs.

The Federal Reserve has a supervisory interest in ensuring that the banking organizations subject to its oversight conduct their futures brokerage activities in a safe and sound manner consistent with Regulations Y and K (including any terms and conditions in Board orders for a particular organization). Accordingly, a review of futures brokerage activities is an important

1. The Board broadened the scope of permissible FCM nonbanking activities for a bank holding company with the revision of Regulation Y, effective April 21, 1997. For example, the following activities are permissible:

- Derivative contracts can be executed and cleared on a broad range of nonfinancial commodities.
- Derivative contracts can be cleared without simultaneously providing execution services. Likewise, execution services can be provided without also providing clearing services.
- Foreign-exchange transactional services can be provided in the same FCM subsidiary that provides advice regarding foreign exchange.
- Bank holding companies can engage in FCM activities through a section 20 subsidiary.
- An FCM nonbanking subsidiary can trade for its own account.
- An FCM nonbanking subsidiary may act on exchange-traded futures contracts and on options on futures contracts based on a financial or nonfinancial commodity.
- A bank holding company may combine FCM activities and incidental activities. For example, FCM activities may be combined with futures-related financing to customers, such as financing to cover margin obligations (note: such financing may be prohibited by some exchanges).

element for inspections of BHCs, examinations of state member banks, and reviews of FBO operations. The following guidance on evaluating the futures brokerage activities of bank holding company subsidiaries, branches and agencies of foreign banks operating in the United States, or any operating subsidiaries of state member banks provides a list of procedures that may be used to tailor the scope of an inspection of these activities.

3250.0.1 SCOPE OF GUIDANCE

Examiners are to use a risk-based inspection approach to evaluating FCM activities—including brokerage, clearing, funds management, and advisory activities. Significant emphasis should be placed on evaluating the adequacy of management and the management processes used to control the credit, market, liquidity, legal, reputation, and operations risks entailed in these operations. Both the adequacy of risk management and the quantitative level of risk exposures should be assessed as appropriate to the scope of the FCM's activities. The objectives of a particular inspection should dictate the FCM activities to be reviewed and set the scope of the inspection.

Examiners are to use a functional-regulatory approach to minimize duplicative inspection and supervisory burdens. Reviews and reports of functional regulators should be used to their fullest extent. However, absent recent oversight inspection, or if an examiner believes that particular facts and circumstances at the banking organization or in the marketplace deem it necessary, a review of operations that would normally be assessed by the appropriate commodities regulator may be appropriate (such as a review of front- or back-office operations).

When futures brokerage occurs in more than one domestic or foreign affiliate, examiners should assess the adequacy of the management of the futures brokerage activities of the consolidated financial organization to ensure that the parent organization recognizes and effectively manages the risks posed by its various futures brokerage subsidiaries. Accordingly, in reviewing futures brokerage operations, examiners should identify all bank holding company, bank operating, or FBO subsidiaries that engage in FCM activities and the scope of those activities. Not all subsidiaries may need to be reviewed to assess the risk management of the consolidated organization. Selection of the particular FCM subsidiaries to be reviewed should be based on an assessment of the risks posed by their activities to the consolidated organization.

This guidance primarily addresses the assessment of activities associated with futures brokerage operations. Any proprietary trading that occurs at an FCM should be assessed in connection with the review of proprietary trading activities of the consolidated financial organization, using the appropriate guidance in the Federal Reserve's *Trading and Capital-Markets Activities Manual.* Similarly, when a review of futures advisory activities is planned, examiners should refer to investment, financial, and futures advisory inspection guidance in this manual (sections 3130.0 and 3130.4) and the *Trust Examination Manual* as appropriate.

3250.0.2 EVALUATION OF FCM RISK MANAGEMENT

Consistent with existing Federal Reserve policies, examiners should evaluate the risk-management practices of FCM operations and ensure that this evaluation is incorporated appropriately in the rating of risk management under the bank (CAMELS), BHC (BOPEC), and FBO (ROCA) rating systems. Accordingly, examiners should place primary consideration on findings related to the adequacy of (1) board and senior management oversight; (2) policies, procedures, and limits used to control risks; (3) systems for measuring, monitoring, and reporting risk; and (4) internal controls and audit programs.

3250.0.2.1 Board and Senior Management Oversight

The board of directors has the ultimate responsibility for the level of risks taken by the organization. Accordingly, the board, a designated subcommittee of the board, or a high level of senior management should approve overall business strategies and significant policies that govern risk-taking in the organization's FCM activities. In particular, the board or a committee thereof should approve policies that identify authorized activities and managerial oversight, and articulate risk tolerances and exposure limits of FCM activities. The board should also actively monitor the performance and risk profile of its FCM activities. Directors and senior management should periodically review information that is sufficiently detailed and timely to allow them to understand and assess the various risks involved in these activities. In addition, the board or a delegated committee should periodically reevaluate the business strategies and major risk-management policies and procedures, emphasizing the organization's financial objectives and risk tolerances.

The FCM's senior management is responsible for ensuring that policies and procedures for conducting FCM activities on both a long-range and day-to-day basis are adequate. Senior management or a designated subcommittee of the board should review and approve these policies and procedures annually. The consistency of these policies with parent company limits or other directions pertaining to the FCM's activities should be confirmed. Management must also maintain (1) clear lines of authority and responsibility for managing operations and the risks involved, (2) appropriate limits on risk-taking, (3) adequate systems and standards for measuring and tracking risk exposures and measuring financial performance, (4) effective internal controls, and (5) a comprehensive risk-reporting and risk-management review process. To provide adequate oversight, management should fully understand the risk profile of FCM activities. Examiners should review reports given to senior management and evaluate whether they consist of good summary information and sufficient detail that will enable management to assess and manage the FCM's risk. As part of its oversight responsibilities, senior management should periodically review the organization's risk-management procedures to ensure that they remain appropriate and sound.

Management should also ensure that activities are conducted by competent staff whose technical knowledge and experience are consistent with the nature and scope of the organization's activities. There should be sufficient depth in staff resources to manage these activities if key personnel are not available. Management should also ensure that back-office and financial-control resources are sufficient to effectively manage and control risks. Functions for measuring, monitoring, and controlling risk should have clearly defined duties. There should be adequate separation of duties in key elements of the risk-management process to avoid potential conflicts of interest. The nature and scope of these safeguards should be in accordance with the scope of the FCM's activities.

3250.0.2.2 Policies, Procedures, and Limits

FCMs should maintain written policies and procedures that clearly outline their approach for managing futures brokerage and related activities. Such policies should be consistent with the organization's broader business strategies, capital adequacy, technical expertise, and general willingness to take risk. Policies, procedures, and limits should address the relevant credit, market, liquidity, reputation, and operations risks in light of the scope and complexity of the FCM's activities. Policies and procedures should establish a logical framework for limiting the various risks involved in an FCM's activities and should clearly delineate lines of responsibility and authority over these activities. They should also address the approval of new product lines, strategies, and other activities; conflicts of interest including transactions by employees; and compliance with all applicable legal requirements. Procedures should incorporate and implement the parent company's relevant policies and should be consistent with applicable statutes, Federal Reserve Board regulations, interpretations, Board orders, and supervisory policies and guidance.

A sound system of integrated limits and risk-taking guidelines is an essential component of the risk-management process. Such a system should set boundaries for organizational risk-taking and ensure that positions that exceed certain predetermined levels receive prompt management attention, so they can be either reduced or prudently addressed.

3250.0.2.3 Risk Measurement, Monitoring, and Reporting

An FCM's system for measuring the credit, market, liquidity, and other risks involved in its activities should be as comprehensive and accurate as practicable and should be commensurate with the nature of its activities. Risk exposures should be aggregated across customers, products, and activities to the fullest extent possible. Examiners should evaluate whether the risk measures and the risk-measurement process are sufficiently robust to accurately reflect the different types of risks facing the organization. Clear standards for measuring risk exposures and financial performance should be established. The standards should provide a common framework for limiting and monitoring risks and should be understood by all relevant personnel.

An accurate, informative, and timely management information system is essential to the prudent operation of an FCM. Accordingly, the examiner's assessment of the quality of the management information system is an important factor in the overall evaluation of the risk-management process. Appropriate mechanisms should exist for reporting risk exposures and the financial performance of the FCM to its board and parent company, as well as for internal management purposes. FCMs must establish management reporting policies to apprise their boards of directors and senior management of material developments, the adequacy of risk management, operating and financial performance, and material deficiencies identified during reviews by regulators and by internal or external audits. The FCM should also provide reports to the parent company (or in the case of foreign-owned FCMs, to its U.S. parent organization, if any) of financial performance; adherence to risk parameters and other limits and controls established by the parent for the FCM; and any material developments, including findings of material deficiencies by regulators. Examiners should determine the adequacy of an FCM's monitoring and reporting of its risk exposure and financial performance to appropriate levels of senior management and to the board of directors.

3250.0.2.4 Internal Controls

An FCM's internal control structure is critical to its safe and sound functioning in general and to its risk-management system, in particular. Establishing and maintaining an effective system of controls, including the enforcement of official lines of authority and appropriate separation of duties—such as trading, custodial, and back-office—is one of management's more important responsibilities. Appropriately segregating duties is a fundamental and essential element of a sound risk-management and internal control system. Failure to implement and maintain an adequate separation of duties can constitute an unsafe and unsound practice, possibly leading to serious losses or otherwise compromising the financial integrity of the FCM.

When properly structured, a system of internal controls promotes effective operations and reliable financial and regulatory reporting; safeguards assets; and helps to ensure compliance with relevant laws, regulations, and organizational policies. Ideally, internal controls are tested by an independent internal auditor who reports directly to either the entity's board of directors or its designated committee. Personnel who perform these reviews should generally be independent of the function they are assigned to review. Given the importance of appropriate internal controls to banking organizations of all sizes and risk profiles, the results of audits or reviews, whether conducted by an internal auditor or by other personnel, should be adequately documented, as should management's responses to them. In addition, communication channels should exist that will allow negative or sensitive findings to be reported directly to the board of directors or the relevant board committee (for example, a board audit committee).

3250.0.3 FUTURES EXCHANGES, CLEARINGHOUSES, AND FCMs

Futures exchanges provide auction markets for standardized futures and options on futures contracts. In the United States and most other countries, futures exchanges and FCMs are regulated by a governmental agency. Futures exchanges are membership organizations and impose financial and other regulatory requirements on members, particularly those that do business for customers as brokers. In the United States and most other countries, futures exchanges also have quasi-governmental (self-regulatory) responsibilities to monitor trading and prevent fraud, with the authority to discipline or sanction members that violate exchange rules. FCMs may be members of the exchange on which they effect customers' trades. When they are not members, FCMs must use other firms who are exchange members to execute customer trades.[2]

Each futures exchange has an affiliated clearinghouse responsible for clearing and settling trades on the exchange and for managing associated risks. When a clearinghouse accepts transaction information from its clearing members, it generally guarantees the performance of the transaction to each member and becomes the counterparty to the trade (that is, the buyer to every seller and the seller to every buyer). Daily cash settlements are paid or collected by clearing members through the clearinghouse. The cash transfers represent the difference between the original trade price and the daily official closing settlement price for each commodity futures contract. The two members settle their sides of the transaction with the clearinghouse,

2. A firm or trading company that maintains only a proprietary business may become a member of an exchange without registering as an FCM.

usually by closing out the position before delivery of the futures contract or the expiration of the option on the futures contract.

An exchange member that wishes to clear or settle transactions for itself, customers, other FCMs, or commodity professionals (locals or market makers) may become a member of the affiliated clearinghouse (clearing member) if it is able to meet the clearinghouse's financial-eligibility requirements. In general, these requirements are more stringent than those required for exchange membership. For example, a clearing member usually is required to maintain a specified amount of net capital in excess of the regulatory required minimum and to make a guaranty deposit as part of the financial safeguards of the clearinghouse. The size of the deposit is related to the scale of the clearing member's activity. If it is not a member of the clearinghouse for the exchange on which a contract is executed, an FCM must arrange for another FCM that is a clearing member to clear and settle its transactions.[3]

Margin requirements are an important risk-management tool for maintaining the financial integrity of clearinghouses and their affiliated exchanges. Clearinghouses require that their members post initial margin (performance bond) on a new position to cover potential credit exposures borne by the clearinghouse. The clearing firm, in turn, requires its customers to post margin. At the end of each day, and on some exchanges on an intraday basis, all positions are marked to the market. Clearing members with positions that have declined in value pay the amount of the decline in cash to the clearinghouse, which then pays the clearing members holding positions that have increased in value on that day. This process of transferring gains and losses among clearing-member firms, known as collecting variation margin, is intended to periodically eliminate credit-risk exposure from the clearinghouse.[4] In volatile markets, a clearinghouse may call for additional variation margin during the trading day, sometimes with only one hour's notice, and failure to meet a variation (or initial) margin call is treated as a default to the clearinghouse.

Some clearinghouses also require that their members be prepared to pay loss-sharing assessments to cover losses sustained by the clearinghouse in meeting the settlement obligations of a clearing member that has defaulted on its (or its customers') obligations. Such assessments arise when losses exceed the resources of defaulting members, the guaranty fund, and other surplus funds of the clearinghouse. Each clearinghouse has its own unique loss-sharing rules.[5] At least one U.S. and one foreign exchange have unlimited loss-sharing requirements. Most U.S. clearinghouses relate loss-sharing requirements to the size of a member's business at the clearinghouse. Given the potential drain on a banking organization's financial resources, the exposure to loss-sharing agreements should be a significant consideration in the decision to become a clearing member. A parent bank holding company may not provide a guarantee or become liable to an exchange or clearing association other than for trades conducted by the subsidiary for its own account or for the account of any affiliate. (See section 225.28(b)(6)(iv) of Regulation Y.)

3250.0.4 COMMODITY EXCHANGE ACT, COMMODITY FUTURES TRADING COMMISSION, AND SELF-REGULATORY ORGANIZATIONS

In the United States, the primary regulator of exchange-traded futures activities is the Commodity Futures Trading Commission (CFTC), which was created by and derives its authority from the Commodity Exchange Act (CEA). The CFTC has adopted registration,[6] financial responsibility, antifraud, disclosure, and other rules for FCMs and CTAs, and has general enforcement authority over commodities firms and professionals that buy or sell exchange-traded futures contracts.

3. The nonmember FCM opens an account, usually on an omnibus basis, with the clearing-member FCM. Separate omnibus accounts have to be maintained for customer and noncustomer or proprietary trading activity. If the FCM does not carry customer accounts by holding customer funds and maintaining account records, the clearing member will carry the customer's account on a fully disclosed basis and issue confirmations, account statements, and margin calls directly to the customer on behalf of the introducing FCM. In such cases, the introducing FCM operates as an introducing broker (IB) and could have registered with the Commodity Futures Trading Commission as such.

4. Some foreign exchanges do not allow the withdrawal of unrealized profits as mark-to-market variation.

5. Clearinghouses usually (1) retain the right to use assets owned by clearing members, but under the control of the clearinghouse (for example, proprietary margin); (2) require additional contributions of funds or assets or require the member to purchase additional shares of the clearinghouse; or (3) perfect a claim against the member for its share of the loss.

6. Many FCMs also are SEC-registered as broker-dealers and are subject to SEC and CFTC financial-responsibility rules.

The futures exchanges, in addition to providing a marketplace for futures contracts, are deemed to be self-regulatory organizations (SROs) under the CEA. For example, a number of SROs have adopted detailed uniform practice rules for FCMs, including ''know your customer'' recordkeeping rules and other formal customer-disclosure requirements. The National Futures Association (NFA) also is an SRO, although it does not sponsor a futures exchange or other marketplace. The NFA has adopted sales-practice rules applicable to members who do business with customers. All FCMs that wish to accept orders and hold customer funds and assets must be members of the NFA.

The CEA and rules of the CFTC require the SROs to establish and maintain enforcement and surveillance programs for their markets and to oversee the financial responsibility of their members.[7] The CFTC has approved an arrangement under which a designated SRO (DSRO) is responsible for performing on-site audits and reviewing periodic reports of a member FCM that is a member of more than one futures exchange. The NFA is the DSRO for FCMs that are not members of any futures exchange.

Oversight of FCMs is accomplished through annual audits by the DSRO and the filing of periodic financial statements and early warning reports by FCMs, in compliance with CFTC and SRO rules. In summary, this oversight encompasses the following three elements:

1. *Full-scope audits at least once every other year of each FCM that carries customer accounts.* Audit procedures conform to a Uniform Audit Guide developed jointly by the SROs. The full-scope audit focuses on the firm's net capital computations, segregation of customer funds and property, financial reporting, recordkeeping, and operations.[8] The audit also reviews sales practices (including customer records, disclosures, advertisements, and customer complaints) and the adequacy of employee supervision. The audit's scope should reflect the FCM's prior compliance history as well as the examiner's on-site evaluation of the firm's internal controls. During the off-year, the DSROs perform limited-scope audits of member FCMs. This audit is limited to financial matters such as a review of the FCM's net capital computations, segregation of customer funds, and its books and records.
2. *FCM quarterly financial reporting requirements.* FCMs are required to file quarterly financial statements (form 1-FR-FCM) with their DSROs. The fourth-quarter statement must be filed as of the close of the FCM's fiscal year and must be certified by an independent public accountant. The filings generally include statements regarding changes in ownership equity, current financial condition, changes in liabilities subordinated to claims of general creditors, computation of minimum net capital, segregation requirements and funds segregated for customers, secured amounts and funds held in separate accounts, and any other material information relevant to the firm's financial condition. The certified year-end financial report also must contain statements of income and cash flows.
3. *Early warning reports.* FCMs are required to notify the CFTC and the SROs when certain financial weaknesses are experienced.[9] For example, if an FCM's net capital falls to a specified warning level, it must file a written notice within five business days and file monthly financial reports (form 1-FR-FCM) until its net capital meets or exceeds the warning level for a full three months. If an FCM's net capital falls below the minimum required, it must cease doing business and give telegraphic notice to the CFTC and any commodities or securities SRO of which it is a member. Similar notices must be given by a clearing organization or carrying FCM when it determines that a position of an FCM must be liquidated for failure to meet a margin call or other required deposit.

3250.0.5 FEDERAL RESERVE REGULATION OF FCMs AND CTAs

Bank holding companies are permitted, under Regulation Y (section 225.28(b)(7)(iv)), to engage

7. CFTC Rule 1.51, contract market program for enforcement, requires that SROs monitor market activity and trading practices in their respective markets, perform on-site examinations (audits) of members' books and records, review periodic financial reports filed by members, and bring disciplinary and corrective actions against members for violations of the CEA and CFTC and SRO rules.

8. If an FCM is also a broker-dealer, the DSRO is not required to examine the FCM for compliance with net capital requirements if the DSRO confers with the broker-dealer's examining authority at least annually to determine that the FCM is in compliance with the broker-dealer's net capital requirements and receives the DSRO copies of all examinations.

9. CFTC Rule 1.12 requires the maintenance of minimum financial requirements by FCMs and introducing brokers. These requirements are similar to those applicable to broker-dealers under SEC rules.

in FCM and CTA activities on both domestic and foreign futures exchanges through separately incorporated nonbank subsidiaries. As a general matter, the nonbank subsidiaries of bank holding companies (and some foreign banks) provide services to unaffiliated customers in the United States under section 4(c)(8) of the Bank Holding Company Act (BHC Act) and to unaffiliated customers outside the United States under Regulation K.[10] Banks and the operating subsidiaries of banks usually provide futures-related services to unaffiliated parties in the United States under the general powers of the bank and to unaffiliated parties outside the United States under Regulation K. These various subsidiaries may provide services to affiliates under section 4(c)(1)(C) of the BHC Act.

Regulation Y permits a bank holding company subsidiary that acts as an FCM to engage in other activities in the subsidiary, including futures advisory services and trading, as well as other permissible securities and derivative activities as defined in sections 225.28(b)(6) (financial and investment advisory activities) and 225.28(b)(7) (agency transactional services for customer investments). Section 225.28(b)(7) specifically authorizes FCMs to provide agency services for unaffiliated persons in execution, clearance, or execution and clearance of any futures contract and option on a futures contract traded on an exchange in the United States and abroad. It also includes the authority to engage in other agency-type transactions (for example, riskless principal) involving a forward contract, an option, a future, an option on a future, and similar instruments. Furthermore, this section codifies the long-standing prohibition against a parent bank holding company's issuing any guarantees or otherwise becoming liable to an exchange or clearinghouse for transactions effected through an FCM, except for the proprietary trades of the FCM and those of affiliates.

A well-capitalized and well-managed bank holding company, as defined in section 225.2(r) and (s) of Regulation Y, respectively, may commence activities as an FCM or a CTA by filing a notice prescribed under section 225.23(a) of Regulation Y. Bank holding companies that are not eligible to file notices or that wish to act in a capacity other than as an FCM or CTA, such as a commodity pool operator (CPO), must follow the specific application process for these activities. Examiners should ensure that all of these activities are conducted in accordance with the Board's approval order.

A bank holding company, bank, or FBO parent company of an FCM is expected to establish specific risk parameters and other limits and controls on the brokerage operation. These limits and controls should be designed to manage financial risk to the consolidated organization and should be consistent with its business objectives and overall willingness to assume risk.

3250.0.6 PARTICIPATION IN FOREIGN MARKETS

FCMs frequently transact business on foreign exchanges as either exchange or clearinghouse members or through third-party brokers that are members of the foreign exchange. The risks of doing business in foreign markets generally parallel those in U.S. markets; however, some unique issues of doing business on foreign futures exchanges must be addressed by the FCM and its parent company to ensure that the activity does not pose undue risks to the consolidated financial organization.

Before doing business on a foreign exchange, an FCM should understand the legal and operational differences between the foreign exchange and U.S. exchanges. For example, the FCM should know about local business practices and legal precedents that pertain to business in the foreign market. In addition, the FCM should know how the foreign exchange is regulated and how it manages risk, and should develop policies and the appropriate operational infrastructure of controls, procedures, and personnel to manage these risks. Accordingly, examiners should confirm that, in considering whether and how to participate in a foreign market, an FCM performs due diligence on relevant legal and regulatory issues, as well as on local business practices. Foreign-exchange risks should be understood and authorized by the FCM's parent company, and any limits set by the parent company or FCM management should be carefully monitored. The FCM and its parent company also should assess the regulatory and financial risks associated with exchange and clearinghouse membership in a foreign market, including an understanding of the extent to which the

10. Those nonbank subsidiaries that operate in the United States may open offices outside the United States if (1) the bank holding company's authority under Regulation Y is not limited geographically, (2) the foreign office is not a separately incorporated entity, and (3) the activities conducted by the foreign office are within the scope of the bank holding company's authority under Regulation Y. In addition, a bank holding company may operate a limited foreign-based business in the United States under Regulation K. (See 12 C.F.R. 211.6.)

foreign clearinghouse monitors and controls day-to-day credit risk and its loss-sharing requirements.

3250.0.7 SPECIFIC RISKS AND THEIR RISK-MANAGEMENT CONSIDERATIONS

In general, FCMs face five basic categories of risk—credit risk, market risk, liquidity risk, reputation risk, and operations risk. The following discussions highlight specific considerations in evaluating the key elements of sound risk management as they relate to these risks. The compliance and internal-controls functions provide the foundation for managing the risks of an FCM.

3250.0.7.1 Credit Risk

FCMs encounter a number of different types of credit risks. The following discussions identify some of these risks and discuss sound risk-management practices applicable to each.

3250.0.7.1.1 Customer Credit Risk

Customer credit risk is the potential that a customer will fail to meet its variation-margin calls or its payment or delivery obligations. An FCM should establish a credit-review process for new customers that is independent of the marketing and sales function. It is not unusual for the FCM's parent company (or banking affiliate) to perform the credit evaluation and provide the necessary internal approvals for the FCM to execute and clear futures contracts for particular customers. In some situations, however, the FCM may have the authority to perform the credit review internally. Examiners should determine how customers are approved and confirm that documentation in the customer's credit files is adequate even when the approval is performed by the parent. Customer credit files should indicate the scope of the credit review and contain approval of the customer's account and credit limits. For example, customer credit files may contain recent financial statements, sources of liquidity, trading objectives, and any other pertinent information used to support the credit limits established for the customer. In addition, customer credit files should be updated periodically.

FCM procedures should describe how customer credit exposures will be identified and controlled. For example, an FCM could monitor a customer's transactions, margin settlements, or open positions as a means of managing the customer's credit risk. Moreover, procedures should be in place to handle situations in which the customer has exceeded credit limits. These procedures should give senior managers who are independent of the sales and marketing function the authority to approve limit exceptions and require that such exceptions be documented.

3250.0.7.1.2 Customer-Financing Risk

Several exchanges, particularly in New York and overseas, allow FCMs to finance customer positions. These exchanges allow an FCM to lend initial and variation margin to customers subject to taking the capital charges under the CFTC's (or SEC's) capital rules if the charges are not repaid within three business days. In addition, some exchanges allow FCMs to finance customer deliveries, again subject to a capital charge.

An FCM providing customer-financing services should adopt financing policies and procedures that identify customer-credit standards. The financing policies should be approved by the parent company and should be consistent with the FCM's risk tolerance. In addition, an FCM should establish overall lending limits for each customer based on a credit review that is analogous to that performed by a bank with similar lending services. The process should be independent of the FCM's marketing, sales, and financing functions, but it may be performed by the FCM's banking affiliate. Examiners should determine how customer-financing decisions are made and confirm that documentation is adequate, even when an affiliate approves the financing. In addition, the FCM should review financial information on its customers periodically and adjust lending limits when appropriate.

3250.0.7.1.3 Clearing-Only Risk

FCMs often enter into agreements to clear, but not execute, trades for customers. Under a ''clearing-only'' arrangement, the customer gives its order directly to an executing FCM. The executing FCM then gives the executed transaction to the clearing FCM, which is responsible for accepting and settling the transaction. Customers often prefer this arrangement because it provides the benefits of centralized clearing (recordkeeping and margin payments) with the flexibility of using a number of specialized brokers to execute transactions.

FCMs entering into clearing-only arrangements execute written give-up agreements, which are triparty contracts that set forth the responsibilities of the clearing FCM, the executing FCM, and the customer. Most FCMs use the ‘‘uniform give-up agreement’’ prepared by the Futures Industry Association, although some FCMs still use their own give-up contracts. The uniform give-up agreement permits a clearing FCM, upon giving prior notice to the customer and the executing FCM, to place limits or conditions on the transactions it will accept to clear or terminate the arrangement. If an executed transaction exceeds specified limits, the FCM may decline to clear the transaction unless it is acting as the qualifying or primary clearing FCM for the customer and has not given prior notice of termination.

Clearing-only arrangements can present significant credit risks for an FCM. An FCM’s risk-management policies and procedures for clearing-only activities should address the qualifications required of clearing-only customers and their volume of trading, the extent to which customer-trading activities can be monitored by the clearing-FCM at particular exchanges, and how aggregate risk will be measured and managed.

The FCM should establish trading limits for each of its clearing-only customers and have procedures in place to monitor their intraday trading exposures. The FCM should take appropriate action to limit its liability either by reviewing and approving a limit exception or by rejecting the trade if a clearing-only customer has exceeded acceptable trading limits. Examiners should confirm that the FCM formally advises (usually in the give-up agreement) its customers and their executing FCMs of the trading parameters established for the customer. Examiners should also confirm that the FCM personnel responsible for accepting or rejecting an executed trade for clearance have sufficient current information to determine whether the trade is consistent with the customer’s trading limits. Prudent give-up agreements (or other relevant documents such as the customer account agreement) should permit the FCM to adjust the customer’s transaction limits when appropriate in light of market conditions or changes in the customer’s financial condition.

Some FCMs act as the primary clearing firm (also referred to as the sponsoring or qualifying firm) for customers.[11] A primary clearing firm guarantees to the clearinghouse that it will accept and clear all trades submitted by the customer or executing FCM, even if the trade is outside the agreed-on limits. Because an FCM is obligated to accept and clear all trades submitted by its primary clearing customers, the FCM must be able to monitor its customers’ trading activities on an intraday basis for compliance with agreed-on trading limits. Monitoring is especially important during times of market stress. The FCM should be ready and able to take immediate steps to address any unacceptable risks that arise, for example, by contacting the customer to obtain additional margin or other assurances, approving a limit exception, taking steps to liquidate open customer positions, or giving appropriate notice of termination of the clearing arrangement to enable the FCM to reject future transactions.

Intraday monitoring techniques will vary depending on the technology available at the particular exchange. A number of the larger, more automated U.S. exchanges have developed technologies that permit multiple intraday collection, matching, and reporting of trades—although the frequency of such reconciliations varies. On exchanges that are less automated, the primary clearing FCM must develop procedures for monitoring clearing-only risks. For example, the FCM could maintain a significant physical presence on the trading floor to monitor customer trading activities and promote more frequent collection (and tallying) of trade information from clearing-only customers. The resources necessary for such monitoring obviously will depend on the physical layout of the exchange—the size of the trading floor and the number of trading pits, the floor population and daily trading volumes, and the level of familiarity the FCM has with the trading practices and objectives of its primary clearing customers. The FCM should be able to increase its floor presence in times of market stress.

3250.0.7.1.4 Carrying-Broker Risk

An FCM may enter into an agreement with another FCM to execute and clear transactions

11. Primary clearing customers include institutions and individuals, as well as other nonclearing futures professionals (locals or floor traders), who execute their own trades on the exchange and other nonclearing FCMs that execute trades for unaffiliated customers.

on behalf of the first FCM (typically, when the first FCM is not an exchange or clearing member of an exchange). In such cases, the FCM seeking another or carrying FCM to execute its transactions should have procedures for reviewing the creditworthiness of the carrying FCM. If the FCM reasonably expects that the carrying FCM will use yet another FCM to clear its transactions (for example, if the carrying FCM enters into its own carrying-broker relationship with another firm for purposes of executing or clearing transactions on another exchange), the first FCM should try to obtain an indemnification from the carrying FCM for any losses incurred on these transactions.[12] When carrying transactions occur on a foreign exchange, an FCM should know about the legal ramifications of the carrying relationship under the rules of the exchange and the laws of the host country. Moreover, it may be appropriate for an FCM to reach an agreement with its customers that addresses liabilities relative to transactions effected on a non-U.S. exchange by a carrying broker.

3250.0.7.1.5 Executing-FCM Risk

When an FCM uses an unaffiliated FCM to execute customer transactions under a give-up arrangement, the clearing firm that sponsors the executing FCM guarantees its performance. Therefore, the first FCM should review the subcontracting risk of its executing FCMs and their sponsoring clearing firms. However, unlike the clearing risk inherent in a carrying-broker relationship, the subcontracting risk for an FCM using an executing FCM is limited to transaction risk (execution errors). An FCM's management should approve each executing broker it uses, considering the broker's reputation for obtaining timely executions and the financial condition of its sponsoring clearing firm.

3250.0.7.1.6 Pit-Broker Risk

Usually, FCMs will subcontract the execution of their orders to unaffiliated pit brokers who accept and execute transactions for numerous FCMs during the trading day. The risk associated with using a pit broker is similar to that of using an executing broker: the risk is limited to the broker's performance in completing the transaction. If the pit broker fails, then the primary clearing firm is responsible for completing the transaction. Therefore, an FCM should approve each pit broker it uses, considering the pit broker's reputation for obtaining timely executions and the resources of its sponsoring clearing firm.

3250.0.7.1.7 Clearinghouse Risk

Clearinghouse risk is the potential that a clearinghouse will require a member to meet loss-sharing assessments caused by another clearing member's failure. Before authorizing membership in an exchange or clearinghouse, an FCM's board of directors and its parent company must fully understand the initial and ongoing regulatory and financial requirements for members. The FCM's board of directors should approve membership in a clearinghouse only after a thorough consideration of the financial condition, settlement and default procedures, and loss-sharing requirements of the clearinghouse.

Particularly when it is considering membership in a foreign exchange or clearinghouse, an FCM's board should examine any regulatory and legal precedents related to how the exchange, clearinghouse, or host country views loss-sharing arrangements. As in the United States, some foreign clearinghouses have unlimited loss-sharing requirements, and some have "limited" requirements that are set at very high percentages. However, the loss-sharing provisions of some of the foreign clearinghouses have not yet been applied, which means that there are no legal and regulatory precedents for applying the stated requirements. In addition, the board should be apprised of any differences in how foreign accounts are viewed, for example, whether customer funds are considered separate from those of the FCM, whether the relationship between an FCM and its customer is viewed as an agency rather than a principal relationship, and whether there are material differences in the way futures activities are regulated.

The board also should be apprised of any material changes in the financial condition of every clearinghouse of which the FCM is a member. Senior management should monitor the financial condition of its clearinghouses as part of its risk-management function.

12. The CFTC takes the position that an FCM is responsible to its customers for losses arising from the failure of the performance of a carrying broker. The industry disagrees with this position, and the issue has not been resolved by the courts.

3250.0.7.1.8 Guarantees

FCM parent companies often are asked to provide assurances to customers and clearinghouses that warrant the FCM's performance. These arrangements may take the form of formal guarantees or less formal letters of comfort.

Under Regulation Y (section 225.28(b)(7)(iv)(B)), a bank holding company may not provide a guarantee to a clearinghouse for the performance of the FCM's customer obligations. A bank holding company may provide a letter of comfort or other agreement to the FCM's customers that states the parent (or affiliate) will reimburse the customers' funds on deposit with the FCM if they are lost as a result of the FCM's failure or default. Customers may seek this assurance to avoid losses that could arise from credit exposure created by another customer of the FCM, since the clearinghouse may use some or all of the FCM's customer-segregated funds in the event of a default by the FCM stemming from a failing customer's obligations.[13] Examiners should note any permissible guarantees for purposes of the consolidated report of the parent bank holding company, as they are relevant to calculating the consolidated risk-based capital of the bank holding company.

3250.0.7.2 Market Risk

When an FCM acts as a broker on behalf of customers, it generally is only subject to market risk if it executes customers' transactions in error. In this regard, operational problems can expose the FCM to market fluctuations in contract values. However, when an FCM engages in proprietary trading, such as market making and other position-taking, it will be directly exposed to market risk. Potential market-risk exposure should be addressed appropriately in an FCM's policies and procedures.

An FCM that engages in proprietary trading should establish market-risk and trading parameters approved by its parent company. The FCM's senior management should establish an independent risk-management function to control and monitor proprietary trading activities. Finally, the FCM should institute procedures to control potential conflicts of interest between its brokerage and proprietary trading activities.

13. The letter of comfort would protect customers whose funds were used to cover other customer losses by the clearinghouse. U.S. clearinghouses also have guarantee funds that can be used to reimburse customers at the clearinghouse's discretion.

3250.0.7.3 Liquidity Risk

Liquidity risk is the risk that the FCM will not be able to meet its financial commitments (end-of-day and intraday margin calls) to its clearing FCM or clearinghouse. Clearing FCMs are required to establish an account at one of the settlement banks used by the clearinghouse for its accounts and the accounts of its clearing members. In some foreign jurisdictions, the central bank fulfills this settlement function. An FCM should establish and monitor daily settlement limits for its customers and should ensure that there are back-up liquidity facilities to meet any unexpected shortfalls in same-day funds. To ensure the safety of its funds and assets, an FCM should also monitor the financial condition of the settlement bank it has chosen and should be prepared to transfer its funds and assets to another settlement bank, when necessary.

To control other types of liquidity risks, an FCM should adopt contingency plans for liquidity demands that may arise from dramatic market changes. An FCM, to the extent possible, should monitor the markets it trades in to identify undue concentrations by others that could create an illiquid market, thereby creating a risk that the FCM could not liquidate its positions. Most U.S. clearinghouses monitor concentrations and will contact an FCM that holds more than a certain percentage of the open interest in a product. In some situations, the exchange could sanction or discipline the FCM if it finds that the FCM, by holding the undue concentration, was attempting to manipulate the market. These prudential safeguards may not be in place on foreign exchanges; consequently, an FCM will have to establish procedures to monitor its liquidity risk on those exchanges.

3250.0.7.4 Reputation Risk

FCMs should have reporting procedures in place to ensure that any material events that harm its reputation, and the reputations of its bank affiliates, are brought to the attention of senior management; the FCM's board of directors; and, when appropriate, its parent company. Reports of potentially damaging events should be sent to senior management at the parent bank holding company, who will evaluate their effect on the FCM to determine what, if any, steps should be taken to mitigate the impact of the event on the whole organization.

3250.0.7.4.1 Commodity Trading Adviser

Acting as a commodity trading adviser (including providing discretionary investment advice to retail and institutional customers or commodity pools) may pose reputation and litigation risks to a CTA or an FCM, particularly when retail customers are involved. Accordingly, the FCM's board should adopt policies and procedures addressing compliance with CFTC and NFA sales-practice rules (including compliance with the ''know your customer'' recordkeeping rules).

3250.0.7.5 Operations Risk, Internal Controls, Internal Audits, and Compliance

3250.0.7.5.1 Operations Risk

Operations risk is the potential that deficiencies in information systems or internal controls will result in unexpected loss. Some specific sources of operating risk at FCMs include inadequate procedures, human error, system failure, or fraud. For FCMs, failure to assess or control operating risks accurately can be a likely source of problems. Back-office or transaction-processing operations are an important source of operations-risk exposures. In conducting reviews of back-office operations, examiners should consult the appropriate chapters of the *Trading and Capital-Markets Activities Manual* for further guidance.

Operations risk also includes potential losses from computer and communication systems that are unable to handle the volume of FCM transactions, particularly in periods of market stress. FCMs should have procedures that address the operations risks of these systems, including contingency plans to handle systems failures and back-up facilities for critical parts of risk-management, communications, and accounting systems.

When FCMs execute or clear transactions in nonfinancial commodities, they may have to take delivery of a commodity because a customer is unable or unwilling to make or take delivery on its contract. To address this situation, the FCM should have in place the procedures it will follow to terminate its position and avoid dealing in physical commodities.

3250.0.7.5.2 Internal Controls

Adequate internal controls are the first line of defense in controlling the operations risks involved in FCM activities. Internal controls that ensure the separation of duties involving account acceptance, order receipt, execution, confirmation, margin processing, and accounting are particularly important. Internal controls should also be established to record, track, and resolve errors and discrepancies with customers and other parties.

FCMs should have approved policies that specify documentation requirements for transactions and formal procedures for saving and safeguarding important documents, consistent with legal requirements and internal policies. Relevant personnel should fully understand documentation requirements. Examiners should also consider the extent to which entities evaluate and control operations risks through internal audits, contingency planning, and other managerial and analytical techniques.

3250.0.7.6 Internal Audits and Their Review

An FCM should be subject to regular internal audits to confirm that it complies with its policies and procedures and is managed in a safe and sound manner. In addition, the internal audit function should review any significant issues raised by compliance personnel to ensure that they are resolved. Other staff within the FCM (i.e., compliance personnel) should be able to reach internal audit staff to discuss any serious concerns they might have. Internal audit reports should be forwarded to the FCM's senior management. Material findings and management's plan to resolve the audit issues should be reported to the FCM's board of directors, the parent company, and any designated board committee (for example, an audit committee). Frequently, the internal audit function is located at the parent company, and audit reports are routinely sent to senior management at the parent company and to the audit committee designated by the board of directors.

3250.0.8 INSPECTION GUIDANCE

The review of an FCM's functions should take a functional-regulatory approach, using the findings of the FCM's primary regulators as much as possible. Examiners should especially focus on the significant risks that the FCM poses to the parent company and affiliated banks. These risks should be assessed by reviewing the adequacy of the FCM's policies and procedures, internal controls, and risk-management functions. Compliance with policies and procedures, and with any conditions on the FCM's activities imposed by regulatory authorities (including the Federal Reserve Board), should be fully reviewed.

Bank holding companies, banks, and FBOs may have more than one subsidiary that acts as an FCM in the United States or that engages in futures transactions for customers in foreign markets. To ensure that the FCM/CTA activities of a banking organization are evaluated on a consolidated basis, a cross-section of affiliated futures brokerage and advisory firms should be reviewed periodically—particularly those that present the greatest risk to the consolidated financial organization. Relevant factors to consider when identifying firms for review include (1) the volume of business; (2) whether the FCM has unaffiliated customers; (3) the number of customers; (4) whether the firm provides customer financing; (5) the number of brokers effecting transactions; (6) whether exchange or clearinghouse memberships are involved; (7) whether the FCM provides clearing-only services; and (8) the date and scope of the last review conducted by the Federal Reserve, SRO, or other regulator.

The scope of any review to be conducted depends on the size of the FCM and the scope of its activities. The draft first-day letter should provide an overview of an FCM's authorized activities and conditions, as well as a description of the actual scope of its business. Examiners should review the most recent summary of management points or other inspection results issued by the FCM's SRO or other regulator, as well as any correspondence between the FCM and any federal agency or SRO. If examiners have any questions about the findings of an SRO's or a regulator's results, they should contact the organization to determine whether the matter is material and relevant to the current inspection. The status of any matters left open after the SRO's or regulator's review should also be inquired about.

An important factor in determining the scope of the inspection is whether the FCM has unaffiliated customers or conducts transactions solely for affiliates. Other factors include whether (1) the FCM is a clearing member of an exchange, particularly of a non-U.S. exchange; (2) it acts as a carrying broker on behalf of other FCMs; (3) it has omnibus accounts with other brokers in markets in which it is not a member (U.S. or foreign); (4) it provides advisory or portfolio management services, including discretionary accounts, or has been authorized to act as a commodity pool operator (CPO); (5) it provides clearing services to locals or market-makers; and (6) it provides financing services to customers.[14]

Examiners are not expected to routinely perform a front- or back-office inspection unless (1) the FCM's primary regulator found material deficiencies in either office during its most recent examination or (2) if front- or back-office operations have not been examined by the primary regulator within the last two years. However, examiners may still choose to review a small sample of accounts and transactions to confirm that appropriate controls are in place. In addition, net capital computations of U.S. FCMs do not need to be reviewed; they are reviewed by the FCM's DSRO, and the FCM is subject to reporting requirements if capital falls below warning levels. Examiners should perform a front- and back-office review of the FCM's operations outside of the United States.[15]

Review of audit function. Examiners may rely on well-documented internal audit reports and workpapers to verify the adequacy of risk management at the FCM. Examiners should review the internal audit reports and workpapers to determine the adequacy of their scope and thoroughness in complying with FCM policies and procedures. If an examiner finds that an internal audit adequately documents the FCM's compliance with a policy or procedure pertaining to the management of the various risk assessments required by the current inspection, that fact should be documented in the workpapers, and inspection procedures should be completed in any area not adequately addressed by the internal audit report. Examiners should periodically spot check areas covered by internal audits to ensure the ongoing integrity of the audit process. Finally, examiners should ensure that internal auditors have adequate training to evaluate

14. If the FCM engages in proprietary trading for its own account, particularly for purposes other than hedging (market making or position taking), or if the FCM acts as an intermediary in any over-the-counter futures or other derivative activities, the examiner should advise the examiner in charge of the inspection so that the firm's proprietary trading can be evaluated in connection with similar activities of the consolidated financial organization.

15. The inspection procedures for reviewing front- and back-office operations may be found in sections 2050.3 and 2060.3, respectively, of the *Trading and Capital-Markets Activities Manual.*

the FCM's compliance with its policies and procedures and with applicable laws and regulations (both inside and, if applicable, outside the United States).

If an examiner has determined that it is not necessary to perform a routine back-office review, he or she should confirm that the FCM has addressed operations risks in its policies and procedures. Examiners also should review the internal controls of an FCM to ensure that the firm is operated safely and soundly according to industry standards and that it complies with any Board regulations or conditions placed on the FCM's activities. Examiners should be alert to any ''red flags'' that might indicate inadequate internal controls. An FCM must be organized so that its sales, operations, and compliance functions are separate and managed independently. If an FCM engages in proprietary trading, examiners should confirm that the firm has procedures that protect against conflicts of interest in the handling of customer orders (examples of these conflicts of interest include front-running or ex-pit transactions). To make an overall assessment of the FCM's future business, the results of any review should be consolidated with the results of reviews by other FCMs inspected during this cycle.

3250.0.9 INSPECTION OBJECTIVES

1. To identify the potential and extent of various risks associated with the FCM's activities, including credit, market, liquidity, and reputation risks.
2. To evaluate the adequacy of the audit function and review significant findings, the method of follow-up, and management's response to correct any deficiencies.
3. To assess the adequacy of the risk-management function at the FCM.
4. To assess the adequacy of and compliance with the FCM's policies and procedures and the adequacy of the internal control function.
5. To evaluate and determine the FCM's level of compliance with relevant statutes, Board regulations, interpretations, orders, and policies.
6. To assess the adequacy of risk management of affiliated FCMs on a consolidated basis.

3250.0.10 INSPECTION PROCEDURES

3250.0.10.1 Structural Organization and Activity Analysis

3250.0.10.1.1 General

1. Identify all bank holding company subsidiaries that engage in FCM- or CTA-type activities in the United States or abroad or identify U.S. FCM/CTA subsidiaries of FBOs. Determine which firms should be inspected to provide a global view of the adequacy of management of these activities on a consolidated basis, based on the scope of activities and the degree of supervision by other regulators. Complete applicable procedures below for firms selected for inspection.
2. Review first-day-letter documents, notices filed under Regulation Y, Board orders and letters authorizing activities, previous inspection reports and workpapers, previous audit reports by futures regulators (CFTC, DSRO, National Futures Association, foreign futures regulator) and correspondence exchanged with those regulatory entities, and reports by internal or external auditors or consultants.
3. Note the scope of the FCM's activities, including—
   a. execution and clearing;
   b. execution only for affiliates and third parties;
   c. clearing-only for affiliates, third parties, professional floor traders (locals);
   d. pit brokerage;
   e. advisory;
   f. discretionary portfolio management;
   g. commodities or commodity pool operator (in FCM or in affiliate);
   h. margin financing;
   i proprietary trading;
   j. exchange market maker or specialist;
   k. types of instruments (for example, financial, agricultural, precious metals, petroleum);
   l. contract markets where business is directed;
   m. other derivatives products (should be identified, for example, interest-rate swaps and related derivative contracts, foreign-exchange derivative contracts, foreign government securities, other);
   n. other futures-related activities, including off-exchange transactions;
   o. riskless-principal transactions; and
   p. registered broker-dealers.
4. Note exchange and clearinghouse memberships here and abroad, noting any financial commitments and any guarantees by the FCM

or its parent[16] to the exchange or clearinghouse with respect to proprietary, affiliate, or customer transactions.
5. Note any new lines of business or activities occurring at the FCM or any changes to exchange and clearing memberships since the last inspection.
6. Note the percentage of business conducted for—
   a. affiliate banks,
   b. nonbank affiliates,
   c. customers (note the breakdown between institutional and retail customers and if there is any guarantee or letter of comfort to customers in which the parent company provides that it will reimburse customers for loss as a result of the FCM's failure or other default),
   d. proprietary accounts (hedging, position-taking), and
   e. professional floor traders (locals, market makers).

3250.0.10.1.2 Audit Program

Determine the quality of the internal audit program. Assess the scope, frequency, and quality of the audit program for the FCM and related activities. Consider spot checking areas covered by internal audits.

1. Review the most recent audit report, noting any exceptions and their resolution.
2. Determine whether internal auditors have adequate training to evaluate the FCM's compliance with its policies and procedures and with applicable laws and regulations.
3. Verify that audit findings have been communicated to senior management and material findings have been reported to the FCM's board of directors and parent company.
4. Identify any areas covered by these procedures that are not adequately addressed by the internal audit report.
5. Identify areas of the internal audit report that should be verified as part of the current inspection.

3250.0.10.1.3 Operational Activities

Determine the scope of review that is appropriate to activities and allocate examiner resources, considering the adequacy of internal audit workpapers.

1. Complete the appropriate front- and/or back-office inspection procedures when—
   a. front- and back-office operations have not been examined by the DSRO within the last two years,
   b. material deficiencies in front- or back-office operations were found by the DSRO during the most recent audit, or
   c. the primary regulator for the FCM is not a U.S. entity.
2. Advise the examiner in charge of the inspection of the parent company if the FCM engages in proprietary trading or over-the-counter futures or derivatives business as principal or agent.

3250.0.10.2 Board and Senior Management Oversight

1. Review the background and experience of the FCM's board of directors and senior management, noting prior banking and futures brokerage experience.
2. Determine if the board of directors of the FCM has approved written policies summarizing the firm's activities listed below, and addressing oversight by the board or a board-designated committee:
   a. the risk appropriate for the FCM, including credit, market, liquidity, operation, reputation, and legal risk (see SR-95-51)
   b. the monitoring of compliance with risk parameters
   c. the exchange and clearinghouse memberships
   d. the internal audit function
3. Determine if senior management of the FCM has adopted procedures implementing the board's policies for—
   a. approval of new-product lines and other activities;
   b. transactions with affiliates;
   c. transactions by employees;
   d. compliance with applicable regulations and policies and procedures;
   e. management information reports;
   f. the separation of sales, operations, back-office, and compliance functions; and
   g. reports to the FCM boards of directors on material findings of the complaint or audit

16. The parent bank holding company cannot provide a guarantee or otherwise become liable to an exchange or clearing association other than for those trades conducted by the FCM subsidiary for its own account or for the account of any affiliate. See Regulation Y, section 225.28(b)(7)(iv)(B).

functions and on material deficiencies identified during the course of regulatory audits or inspections.
4. Determine that policies and procedures are periodically reviewed by the board of directors or senior management, as appropriate, and ensure that they comply with existing regulatory and supervisory standards and address all of the FCM's activities.
5. Review management information reporting systems and determine whether the board of directors of the parent company (or a designated committee of the parent's board) is apprised of—
   a. material developments at the FCM,
   b. the financial position of the firm including significant credit exposures,
   c. the adequacy of risk management,
   d. material findings of the audit or compliance functions, and
   e. material deficiencies identified during the course of regulatory reviews or inspections.
6. Review the FCM's strategic plan.
   a. Assess whether there are material inconsistencies between the stated plans and the FCM's stated risk tolerances.
   b. Verify that the strategic plan is reviewed and periodically updated.

3250.0.10.3 Risk Management

3250.0.10.3.1 Credit Risk

1. Review credit-risk policies and procedures.
   a. Verify the independence of credit-review approval from the limit-exceptions approval.
   b. Verify that the procedures designate a senior officer with the responsibility to monitor and approve limit-exception approvals.
2. Determine whether the FCM has authority to open customer accounts without parent company approval.
3. Review the customer base (affiliates, third parties) for credit quality in terms of affiliation and business activity (affiliates, corporate, retail, managed funds, floor traders, etc.).
4. Evaluate the process for customer-credit review and approval. Determine whether the customer-credit review identifies credit risks associated with the volume of transactions executed or cleared for the customer.
5. Evaluate the adequacy of credit-risk-management policies. Determine if they—
   a. establish and require adequately documented credit limits for each customer that reflect their respective financial strengths, liquidity, trading objectives, and potential market risk associated with the products traded;
   b. require periodic updates of such credit limits in light of changes in the financial condition of each customer and market conditions; and
   c. do not permit the FCM to waive important broker safeguards, such as the right to liquidate customer positions upon default or late payment of margin.
6. Consider verifying the above information by sampling customer-credit files.
7. Verify that up-to-date customer-credit files are maintained on site or are available for review during the inspection. If the customer-credit approval was performed by the parent company or an affiliate bank, verify that the FCM's files contain information indicating the scope of the credit review, the approval, and credit limits.
8. Review notifications and approval of limit exceptions for compliance with FCM procedures.
9. Determine whether the FCM has adopted procedures identifying when the FCM should take steps to limit its customer-credit exposure (for example, when to refuse a trade, grant a limit exception, transfer positions to another FCM, or liquidate customer positions).
10. Evaluate the adequacy of risk management of customer-financing activities.
11. Determine that the credit-review process is independent from the marketing, sales, and financing function.
    a. Verify that the FCM has policies that identify customer-credit standards and that it establishes overall lending limits for each customer.
    b. Assess the adequacy of the credit-review process and documentation, even when credit review is performed by an affiliate.
12. Review the instances when the FCM has lent margin to customers on an unsecured basis. If the FCM does not engage in margin financing as a business line, verify that extensions are short-term and within the operational threshold set for the customer.

3250.0.10.3.2 Clearing-Only Risk

1. Determine whether each clearing arrangement is in writing and that it—
   a. identifies the customer and executing brokers, and defines and adequately documents the respective rights and obligations of each party;
   b. establishes overall limits and trading parameters for the customer that are based on the customer's creditworthiness and trading objectives; and
   c. permits transaction limits to be adjusted to accommodate market conditions or changes in the customer's financial condition.
2. When the FCM has entered into a clearing-only agreement with a customer, verify that it has reviewed the creditworthiness of each executing broker or its qualifying clearing firm identified in the agreement.
3. If the FCM acts as the primary clearing firm for locals or other customers, confirm that the firm has adopted procedures for monitoring and controlling exposure. Note whether the firm monitors customer positions throughout the trading day and how this monitoring is accomplished.

3250.0.10.3.3 Carrying Brokers, Executing Brokers, and Pit Brokers

1. If the FCM uses other brokers to execute and/or clear transactions, either on an omnibus or a fully disclosed basis, determine that it has adequately reviewed the creditworthiness and approved the use of the other brokers. If the FCM uses nonaffiliated executing brokers, confirm that it also has considered the reputation of the broker's primary clearing firm. If the other broker is likely to use another broker, determine whether the broker has given the FCM an indemnification against any loss that results from the performance or failure of the other broker.
2. If the FCM uses other brokers to execute or clear transactions in non-U.S. markets, determine whether senior management understands the legal risks pertinent to doing business in those markets and has adopted policies for managing those risks.
3. When the FCM uses third-party "pit brokers" to execute transactions, verify that the FCM has reviewed and approved each broker after considering the reputation of the pit broker's primary clearing firm.

3250.0.10.3.4 Exchange and Clearinghouse Membership

1. Verify that the FCM completes a due-diligence study of each exchange and clearinghouse before applying for membership in the organization.
   a. Determine whether board minutes approving membership demonstrate a thorough understanding of the loss-assessment provisions and other obligations of membership for each exchange and clearinghouse, as well as a general understanding of the regulatory scheme.
   b. Determine whether, in approving membership in a non-U.S. exchange or clearinghouse, the board's minutes indicate a discussion of the regulatory environment and any relevant credit, liquidity, and legal risks associated with doing business in the particular jurisdiction. The minutes should also reflect discussion of any material differences from U.S. precedent in how foreign accounts are viewed, for example, whether customer funds held in an omnibus account are considered separate (segregated) from those of the FCM or whether the relationship between the FCM and its customers is viewed as an agency or principal relationship in the host country.
2. Verify that the FCM has apprised its parent company of the results of its study of the exchange or clearinghouse and that it has written authorization by senior management of its parent company to apply for membership.
3. Verify that the FCM monitors the financial condition of each exchange and clearing organization for which it is a member.
4. Review all guarantees, letters of comfort, or other forms of potential contingent liability. Verify that the parent company has not provided a guarantee to the clearinghouse for the performance of the FCM's customer obligations.[17] Note any guarantees against the parent losses incurred from the failure of an FCM and advise the examiner in charge of the parent company's inspection, who can confirm that guarantees are included in the

17. The parent bank holding company cannot provide a guarantee or otherwise become liable to an exchange or clearing association other than for those trades conducted by the FCM subsidiary for its own account or for the account of any affiliate. See Regulation Y, section 225.28(b)(7)(iv)(B).

bank holding company's calculation of consolidated risk-based capital.

3250.0.10.3.5 Market Risk

1. If an FCM engages in proprietary trading, determine whether policies and procedures are in place to control potential conflicts of interest between its brokerage business and trading activities.
2. When an FCM plans to enter (or has entered into) a foreign market, determine if the FCM performed due-diligence reviews of relevant legal and regulatory issues, as well as on local business practices.

3250.0.10.3.6 Liquidity Risk

1. Verify that the FCM has established and monitors daily settlement limits for each customer to ensure that liquidity is sufficient to meet clearinghouse obligations.
2. Determine whether the FCM has established back-up liquidity facilities to meet unexpected shortfalls.
3. Verify that the FCM monitors by product the amount of open interest (concentrations) that it holds at each exchange, either directly or indirectly through other brokers. If positions are held on foreign exchanges and concentrations are not monitored, verify that the FCM is able to monitor its positions and manage its potential liquidity risks arising from that market.
4. Review liquidity contingency plans for dealing with dramatic market changes.

3250.0.10.3.7 Reputation Risk

1. Review management information reporting systems and determine whether—
   a. the FCM is able to assess the extent of any material exposure to legal or reputation risk arising from its activities, and
   b. the parent company receives sufficient information from the FCM to assess the extent of any material exposure to litigation or reputation risk arising from the FCM's activities.
2. If the FCM provides investment advice to customers or commodity pools, determine whether it has procedures designed to minimize the risks associated with advisory activities. Such procedures might address the delivery of risk disclosures to customers, the types of transactions and trading strategies that could be recommended or effected for retail customers, compliance with the ''know your customer'' recordkeeping and other sales practice rules of the SROs, and conformance to any trading objectives established by the customer or fund.
3. If the FCM acts as a CPO, verify that it has obtained prior Board approval and is in compliance with any conditions in the Board order.

3250.0.10.4 Operations, Internal Controls, and Compliance

1. Determine the extent to which operating risk is evaluated and controlled through the use of internal audits, contingency planning, and other managerial and analytical techniques.
2. Review the most recent summary of management points or similar document and also respective correspondence issued by the FCM's DSRO or other primary futures regulator. Discuss any criticism with FCM management and confirm that corrective action has been taken.
3. Consider reviewing a small sample of accounts and transactions to confirm that appropriate controls are used and that the FCM has incorporated operations risks into its policies and procedures.
4. Review the organizational structure and reporting lines within the FCM and verify separation of sales, trading, operations, compliance, and audit functions.
5. Determine that the FCM's policies and procedures address the booking of transactions by affiliates and employees and other potential conflicts of interest.
6. If the FCM is authorized to act as a CPO, review the most recent NFA or other primary futures regulator's audit, including any informal findings by examiners. Discuss any criticism with the FCM management and confirm that corrective action has been taken.
7. If the FCM executes and clears nonfinancial futures, verify that the FCM has procedures to avoid taking physical possession of the nonfinancial product when effecting ''exchange for physical transactions'' for customers.

8. When the FCM takes physical delivery of commodities due to failure or unwillingness of a customer to make or take delivery of its contracts, determine whether the FCM has and follows procedures to close out its position. Note if the FCM frequently takes delivery of physical commodities.
9. Assess the adequacy of customer-complaint review by reviewing the complaint file and how complaints are resolved. Note if the FCM receives repeat or multiple complaints involving one or more of its activities or employees.
10. Determine whether the FCM has developed contingency plans that describe actions to be taken in times of market disruptions and whether such plans address management responsibilities, including communications with its parent bank holding company, liquidity, the effect on customer-credit quality, and communications with customers.

3250.0.10.5 Conclusions

1. Prepare inspection findings and draw conclusions as to the adequacy of the FCM's risk-management, compliance, operations, internal controls, and audit functions.
2. Present findings to FCM management and submit inspection findings to the examiner in charge of the parent company inspection.

3250.0.11 FCM Supplemental Checklist Questionnaire

	Yes	*No*
3250.0.11.1 General Questions		
1. Is the FCM a separately incorporated subsidiary of the bank holding company as required by Regulation Y, 12 C.F.R. 225.28(b)(6)(iv)?	______	______
2. Has the parent bank holding company provided a guarantee or otherwise become liable to an exchange or clearing association other than for those trades conducted by a subsidiary for its own account or for the account of any affiliate (prohibited by Regulation Y (see 12 C.F.R. 225.28(b)(6)(iv))?	______	______

3. How long has the FCM been in operation?______yrs.
4. Approximately how many customers does the FCM have?______
5. What degree of market participation does the FCM have (mark (x) for the highest level of involvement)?
   a. __________ FCM, nonmember of futures exchange. Must execute trades through exchange members and is subject to NFA rules.
   b. __________ Exchange member. Holds membership on one or more futures exchanges entitling FCM to execute trades on the exchange(s) and subjecting FCM to the rules of exchange(s).
   c. __________ Clearinghouse member. Holds membership in an exchange's clearinghouse as well as exchange membership, thus enabling FCM to execute and clear its own transactions. Such FCM is subject to exchange and clearinghouse rules.
6. If FCM is an exchange member, on which exchange(s) (domestic and foreign) does the FCM have membership(s)?

   ____

   ____

   ____

	Yes	No
7. If FCM is a clearing member, list below the clearinghouse(s) of which it is a member. ____ ____ ____		
8. Does the FCM periodically make an adjusted net capital computation to verify that it maintains capitalization fully adequate to meet its own commitments and those of its customers, including affiliates?	_____	_____
(NOTE: Under the CFTC's net capital computations, there have been no capital requirements for ''hedge'' transactions by FCM affiliate banks. It may be necessary to request that an adjusted net capital computation be made to determine the amount of adjusted net capital required when affiliate trades are treated as third-party transactions.)		
9. Does a review of the FCM's correspondence from its designated self-regulatory organization reveal that the FCM meets CFTC requirements with respect to capital rules, segregation of customer assets, and risk disclosure?	_____	_____
10. If an FCM will receive services from an affiliate (e.g., the lead bank assesses FCM customer-credit risk or monitors customer positions and margin accounts), have the FCM and affiliate entered into a formal service agreement on an explicit fee basis?	_____	_____

3250.0.11.2 Management

	Yes	No
1. Does the FCM's management have expertise and previous experience as a broker, dealer, or participant in cash, futures, or forward markets related to those in which the FCM executes transactions?	_____	_____
2. Does the FCM's management have prior banking experience?	_____	_____
3. Does it appear that management has the expertise necessary to evaluate the viability of various hedging strategies?	_____	_____
4. Does it appear that FCM management has the ability to recognize imprudent or unsafe customer activity that could endanger the FCM?	_____	_____
5. Does the board of directors have written policies that summarize the firm's activities and its oversight function (certain functions may be designated to a board audit or other committee) with respect to—		
a. risk appropriate for the FCM?	_____	_____
b. compliance monitoring and risk parameters?	_____	_____

3250.0.11.3 Controls of Risk Exposure with Customers

	Yes	No
1. Does the FCM have a system for assessing and periodically re-evaluating customer-credit risk?	_____	_____

	Yes	*No*
2. Does the FCM take customer-credit risk into consideration and establish for each customer—	______	______
a. position limits for each contract the customer wishes to trade?	______	______
b. an aggregate position limit for outstanding contracts held by each customer?	______	______
3. Does the FCM have a system for monitoring customer positions to ensure positions are within the limits imposed by the FCM?	______	______
4. Does the FCM have an adequate system in place to monitor its overall risk exposure, primarily customer-default risk, on a daily basis?	______	______
5. Do customer agreements and internal procedures enable the FCM to—		
a. limit the types of trades a customer engages in?	______	______
b. refuse, when appropriate, to execute any trades except those resulting in liquidation of existing positions?	______	______

3250.0.11.4 Margin Requirements

1. Does the FCM have a system for daily monitoring of margin accounts to ensure that margin calls are promptly issued and satisfied?	______	______
2. Does the customer agreement permit and has the FCM adopted procedures for liquidating a customer's position if margin calls are not promptly satisfied?	______	______
3. Do customer-account agreements authorize the FCM to require higher initial and variation margin levels than those set by the exchanges?	______	______
4. Does the FCM have a system in place for obtaining higher customer margins in instances when the FCM determines—	______	______
a. a customer's futures position or deteriorating financial condition necessitates a greater amount of margin to protect the FCM?	______	______
b. volatile market conditions justify higher levels of margin than those required by an exchange?	______	______

3250.0.11.5 Credit Risk

1. Is the credit-review approval independent from the limit-exceptions approval?	______	______
2. Does a senior officer monitor and approve limit-exception approvals?	______	______
3. Does the customer-credit review identify credit risks associated with the volume of transactions executed or cleared for the customer?	______	______
4. Is adequate documentation required and maintained of credit limits for each customer that reflect customers' respective financial strengths and liquidity, trading objectives, and the potential market risk associated with the products traded?	______	______
5. Has the FCM adopted procedures identifying when the FCM should take steps to limit its customer-credit exposure (e.g., when to refuse a trade, grant a limit exception, transfer positions to another FCM, or liquidate customer positions)?	______	______
6. Is the credit-review process independent from the marketing/sales function and the financing function?	______	______

	Yes	No
3250.0.11.6 Clearing-Only Risk		
1. Is each arrangement in writing and does it—		
a. identify the customer, executing brokers, and define and adequately document the respective rights and obligations of each party?	______	______
b. establish overall limits and trading parameters for the customer that are based on the customer's creditworthiness and trading objectives?	______	______
c. permit transaction limits to be adjusted to accommodate market conditions or changes in the customer's financial condition?	______	______
2. Has the FCM or its qualifying clearing firm verified that it has reviewed the creditworthiness of each executing broker?	______	______
3. If the FCM acts as the primary clearing firm for locals or other customers, has the firm adopted procedures for monitoring and controlling exposure throughout the trading day?	______	______
3250.0.11.7 Carrying Brokers, Executing Brokers, and Pit Brokers		
1. If the FCM uses other brokers to execute and/or clear transactions, either on an omnibus or fully disclosed basis, has it adequately reviewed the creditworthiness and approved the use of the other brokers?	______	______
2. Has the FCM been given an indemnification against any loss that results from the performance or failure of the other broker?	______	______
3. If the FCM uses nonaffiliated executing brokers, has it considered the reputation of the broker's primary clearing firm?	______	______
3250.0.11.8 Exchange and Clearinghouse Membership		
1. Does the FCM complete a due-diligence study of each exchange and clearinghouse before applying for membership in such organization?	______	______
2. Do the board minutes approving such memberships demonstrate a thorough understanding of the loss-assessment provisions and other obligations of membership for each exchange and clearinghouse, as well as a general understanding of the regulatory scheme?	______	______
3. In approving membership in a non-U.S. exchange or clearinghouse, do the board minutes evidence a discussion of the regulatory environment and any relevant credit, liquidity, and legal risks associated with doing business in a particular jurisdiction?	______	______
4. Does the FCM monitor the financial condition of each exchange and clearing organization for which it is a member?	______	______
3250.0.11.9 Market Risk		
1. If an FCM engages in proprietary trading, are policies and procedures in place to control potential conflicts of interest between its brokerage business and trading activities?	______	______
2. If an FCM has entered or plans to enter a foreign market, has the FCM performed due-diligence reviews of relevant legal and regulatory issues, as well as on local business practices?	______	______

	Yes	*No*

3250.0.11.10 Liquidity Risk

1. Has the FCM established and does it monitor daily settlement limits for each customer to ensure liquidity sufficient to meet clearinghouse obligations? ______ ______
2. Has the FCM established back-up liquidity facilities to meet unexpected shortfalls? ______ ______
3. Does the FCM monitor the amount of open interest (concentrations) by product that it holds, directly or indirectly, at each exchange? ______ ______

3250.0.11.11 Reputation Risk

1. Is the FCM able to assess the extent of any material exposure to legal or reputation risk arising from its activities? ______ ______
2. Does the parent company receive sufficient information from the FCM's information systems to assess the extent of any material exposure to litigation or reputation risk arising from the FCM's activities? ______ ______
3. If the FCM provides investment advice to customers or commodity pools, does it have procedures designed to minimize the risks associated with advisory activities? ______ ______
4. If the FCM acts as a CPO, has it obtained prior Board approval and is it in compliance with any conditions in the Board order? ______ ______

3250.0.11.12 Internal Controls

1. Does the FCM have written procedures pertaining to the following:
   a. the types of futures and options on futures contracts which the FCM will execute? ______ ______
   b. individuals authorized to effect transactions and sign contracts and confirmations? ______ ______
   c. the firms or individuals with whom FCM employees may conduct business? ______ ______
2. Does the FCM obtain written authorization from customers specifying the individuals who are authorized to execute trades on behalf of the customers? ______ ______
3. Does the FCM have written procedures governing—
   a. the solicitation and acceptance of customers? ______ ______
   b. the execution of purchases and sales? ______ ______
   c. processing transactions? ______ ______
   d. accounting for transactions? ______ ______
   e. clearing of transactions? ______ ______
   f. safekeeping of customer margin deposits or securities deposited as margin? ______ ______
4. Does the FCM have written contracts with all firms or individuals who may conduct business on behalf of the FCM? ______ ______
5. Does the FCM have proper segregation of duties to ensure that individuals involved in executing transactions are not able to make accounting entries? ______ ______
6. Does the FCM have a numbered and controlled system of order tickets and confirmations to prevent unauthorized trading and to verify the accuracy of records and enable reconciliation throughout the system? ______ ______

	Yes	No
7. Does the FCM have procedures to time stamp receipt of all orders at least to the nearest minute and execute all orders strictly in chronological sequence (to the extent consistent with the customers' specifications)?	______	______
8. Does the FCM have a system for routing incoming confirmations to an operating unit separate from the unit that executes transactions?	______	______
9. Does the FCM have a system for comparing internal and external confirmations to ensure that the FCM will not accept or deliver securities and/or margin payments without proper authorization and documentation?	______	______
10. Does the FCM have procedures to ensure that someone outside the trading unit is responsible for resolution of trades in which incoming and outgoing confirmations do not match?	______	______
11. With respect to transactions cleared by others, are procedures in place for verifying and agreeing clearing FCM open position and margin deposit reports?	______	______
12. Does the FCM review daily outstanding contracts, customer positions, and margin balances?	______	______
13. Does FCM management regularly review all adjustments affecting futures positions or income recognition to verify that such adjustments were proper and approved?	______	______
14. Are subsidiary ledgers regularly reconciled to the general ledger?	______	______
15. Has the FCM adopted written supervisory procedures for supervising brokers and others to ensure that they follow written policies and procedures?	______	______
16. Are there written procedures containing criteria for selecting and training competent personnel?	______	______
17. Does the FCM have a comprehensive reporting system for providing management with all the information necessary to effectively manage the FCM's operations?	______	______
18. Are procedures in place to ensure that any futures advisory services (investment advice) furnished—		
a. reflect the views of persons authorized to supervise advisory activities?	______	______
b. are authorized under Regulation Y or by Board order?	______	______
19. Is there a formal and comprehensive internal audit program pertaining to FCM activities?	______	______

2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

This section serves as a prelude to the futures commission merchant activities (FCM) that are provided as examples of previous Board FCM decisions. Sections 3251.0.1 through 3251.0.13 provide brief historical summaries of Board decisions that may have led to the authorizations that have been incorporated into the April 1997 revision of Regulation Y for this activity. The summaries provide the reader with some historical perspective as to how and why the current provisions of Regulation Y evolved for FCMs. Certain conditions and commitments within these orders may no longer apply to the current provisions of Regulation Y. Therefore, reference must be made to the current Regulation Y, section 225.28(b)(7)(iv).

3251.0.1 FCM BROKERAGE OF FUTURES CONTRACTS ON A MUNICIPAL BOND INDEX

A bank holding company applied pursuant to section 4(c)(8) of the BHC Act and section 225.23(a)(3) of Regulation Y to engage de novo, through a wholly owned subsidiary located in the state of New York, to execute and clear futures contracts on a municipal bond index. The applicant also proposed to offer futures advisory services for a separate fee or as an integrated package of services to futures commission merchant customers through the subsidiary.

The Board had previously approved by regulation the activity of executing and clearing futures contracts on bullion, foreign exchange, U.S. government securities, and money market instruments, primarily on the basis that banks may hold and deal in the underlying cash items. The proposed futures contract on a municipal bond index was based on an index of general obligation bonds selected by the *The Bond Buyer*. The Bond Buyer Municipal Index is composed of 50 tax-exempt municipal revenue and general obligation bonds chosen on the basis of criteria that favor recently issued and actively traded bonds. The index is intended to be an accurate indicator of trends and changes in the municipal bond market. The offering of futures contracts based on the bond index (broad spectrum of municipal securities) could provide FCM customers with a more effective tool for hedging against the price risk associated with a portfolio of municipal bonds than any of the existing interest-rate futures contracts.

Banks are permitted to hold and deal in general obligation bonds, and they are active participants in the cash markets for those bonds. Based on these facts, the Board determined that the applicant's proposal was substantially similar to proposals to broker other financial futures previously approved by the Board, and was thus closely related to banking.

With regard to the proposed advisory activities, the Board had previously approved by order the provision of advisory services relating to approved FCM activities (1984 FRB 780). The applicant proposed to provide advisory services either for a separate fee or as an integral package of services to FCM customers. The services would include written or oral presentations on the historical relationship between the cash and futures markets, a demonstration of examples of financial futures uses for hedging, and assistance in structuring a hedging strategy. The applicant would provide these services only to major corporations and other financial institutions.

Based on all the facts provided, the Board concluded that—

1. the proposed activities by the applicant could reasonably be expected to produce benefits to the public;
2. the proposed FCM activities would entail risks or conflicts of interests different than those considered and addressed by the Board in its approvals of other FCM activities; and
3. the balance of the public-interest factors was favorable.

The Board noted, however, that trading of the futures contract involved in the application had not been approved by the Commodity Futures Trading Commission (CFTC). It therefore conditioned its December 21, 1984, approval of the application on the CFTC's approval of the contract (1985 FRB 111).

3251.0.2 FCM BROKERAGE OF CERTAIN FUTURES CONTRACTS ON STOCK INDEXES INCLUDING OPTIONS

A bank holding company applied, under section 4(c)(8) of the BHC Act and section 225.21(a) of Regulation Y, to engage, de novo through its wholly owned futures corporation, in executing and clearing, on major commodity exchanges, futures contracts on stock indexes and options on such futures contracts. The subsidiary would execute and clear—

1. the Standard & Poor's 100 Stock Price Index futures contract;
2. the Standard & Poor's 500 Stock Price Index futures contract (S&P 500);
3. options on the S&P 500, all of which are traded on the Index and Option Division of the Chicago Mercantile Exchange;
4. the Major Market Index futures contract, currently traded on the Chicago Board of Trade; and
5. the FT-SE 100 Equity Index futures contract, currently traded on the London International Financed Futures Exchange.

The execution and clearance of stock index futures and options traded on major commodity exchanges appeared to be functionally and operationally similar to securities brokerage, permitted for bank holding companies under section 225.28(b)(6)(i) of Regulation Y. Like municipal bond index futures (an activity proposed by an applicant which was previously approved by Board order), these futures contracts are settled in cash and are designed to allow customers to hedge the market risk associated with holding financial assets, in this instance, corporate equity securities. The equities represented by the listed indexes were chosen on the basis of criteria that favor a combination of securities that would accurately reflect fluctuations in the stock market.

The Board approved the application on February 4, 1985, based on the above analysis and on the fact that national banks have been permitted to execute and clear stock index futures, and options thereon, for the account of customers, through their FCM operations subsidiaries (1985 FRB 251). It also took into consideration the fact that trust departments of banks have begun to use stock index futures contracts and options on such contracts to hedge the market risk facing diversified stock portfolios.

3251.0.3 LIMITED FCM CLEARING-ONLY AND EXECUTING-ONLY TRADES

A bank holding company (the applicant) applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.23(a)(3) of Regulation Y to engage de novo in various FCM activities. The activities were to be conducted through its wholly owned FCM subsidiary (the company). The FCM activities consisted of—

1. executing and clearing, executing without clearing, and clearing without executing, as agent for institutional customers, the futures contracts and options on futures contracts listed in appendix A of the order;
2. executing and clearing as agent for institutional customers, through omnibus trading accounts with unaffiliated FCMs, the futures contracts and options on futures contracts listed in appendix B of the order; and
3. providing related investment advisory services.

The applicant proposed to conduct the activities throughout the United States.

The applicant requested authority to conduct, through the company, both execution and clearing activities on the Chicago Mercantile Exchange (CME) and the Chicago Board of Trade (CBOT). The company also planned to conduct FCM activities through omnibus customer trading accounts established in its own name with clearing members of the exchanges on which the company would not be a member.[1]

The applicant also sought authority for the company to clear trades on the CME and the CBOT that had been executed by unaffiliated brokers pursuant to "give-up agreements." Under the applicant's proposal, the company would not be the primary clearing member for any nonclearing member on the CBOT and would not qualify any nonclearing member on the CME. The company also planned to execute trades that would be given up for clearance, at the customer's request, to an unaffiliated FCM.

The Board had previously determined, by regulation and order, that acting as an FCM in executing and clearing all of the proposed financial futures contracts and options on futures contracts, and providing investment advisory services with respect to such contracts, are activities closely related to banking under sec-

1. An omnibus account is an arrangement between a member clearing firm of an exchange and a nonmember FCM that seeks to conduct business on that exchange. Using this arrangement, the member clearing firm executes and clears transactions for the nonmember FCM and its customers. The omnibus account reflects all positions of the FCM's customers but is divided into separate segments for each customer for the purposes of calculating margin requirements, reporting current holdings, and other matters.

tion 4(c)(8) of the BHC Act with two exceptions.[2] See section 225.28(b)(7)(iv) and (b)(6)(iv) of Regulation Y and the Board orders found at 1992 FRB 953, 1991 FRB 64, 1990 FRB 881, and 1990 FRB 554.

On January 9, 1991, the Board denied a bank holding company's application to engage, through a nonbanking subsidiary, in clearing-only activities related to securities options and other financial instruments. The applicant in that case had proposed that its subsidiary primarily clear, but not execute, trades for professional floor traders (primarily market makers and specialists) trading for their own accounts on major securities and commodities exchanges. (See section 3700.12 and 1991 FRB 189.)

In the 1991 case, the Board was concerned that, by not engaging in both the execution and clearance of a trade, the nonbanking subsidiary could not decline transactions that posed unacceptable risk. It would have been obligated to settle each trade entered into by one of its customers, even if the customer did not have the financial resources to honor the obligation. No mechanism existed by which the nonbanking subsidiary could contemporaneously monitor the intra-day trading activities of the floor traders, its primary customers. The Board decided that the proposed nonbanking activity exposed the parent bank holding company to substantial credit risk. This decision was based on (1) the subsidiary's inability to monitor and control the risks to be undertaken and (2) the fact that clearing agents had to guarantee the financial performance of their customers to the clearinghouses of the exchanges on which they operate. The public-benefit considerations therefore precluded approval of that application under section 4(c)(8) of the BHC Act.

The applicant's proposal differed from the 1991 case in several respects. Under the proposal, the company would not serve as the primary or qualifying clearing firm for any unaffiliated customers. Also, the company would clear only those trades that it executed, or that other executing brokers executed and the company accepted for clearance pursuant to a customer's give-up agreement. The executing brokers would be independent from the customers and would have the opportunity to evaluate the trade before it was executed.

All of the company's clearing-only activities would be conducted pursuant to give-up agreements. Under these give-up agreements and other customer agreements, the company would have the right to refuse to accept for clearance any customer trade that it deemed unsuitable. The refusal could stem, for example, from consideration of market conditions or the customer's financial situation or objectives. Also, the applicant represented that it would be able to restrict the number and types of positions to be held by a customer as it deemed reasonable. The company could then refuse to accept trades that posed unacceptable risks.

The company established a framework for limiting risk from the clearing-only activities. It would review the creditworthiness of each potential customer and, based on the review, approve or reject the customer and establish appropriate limits concerning trading, margin, credit, and exposure limits. The company had controls in place to monitor the intra-day trading activities and risk exposure of its customers.

The Board determined that the credit and other risk considerations associated with the proposed clearing-only activities on the CME and CBOT were consistent with previous approvals. The decision was based on (1) the framework for limiting risk from clearing-only activities, (2) the commitments made by the applicant, and (3) the other facts of record. After reviewing other required considerations, the Board approved the application on May 6, 1993 (1993 FRB 723). Approval was subject to the commitments made by the applicant and the terms and conditions set forth in the order as well as in other Board orders related to the proposed activities.

3251.0.4 FCM CLEARING TRANSACTIONS BY PREAPPROVED EXECUTION GROUPS

A foreign banking organization (the applicant) subject to the provisions of the BHC Act applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.23(a) of Regulation Y to engage de novo in clearing trades of sophisticated institutional investors relating to contracts on futures and options on futures. Trades would be cleared through the applicant's majority-owned clearing subsidiary (the com-

2. The two exceptions are the Deutsche Aktienindex 30 Stock Index futures and the German Government Bond Index futures contracts traded on the Deutsche Terminborse GmbH. These two contracts had been approved as FCM activities pursuant to Regulation K. The Board also noted that these contracts served the same functions as the futures contracts for which FCM activities had previously been approved under section 4(c)(8) of the BHC Act.

pany) on the Chicago Mercantile Exchange (CME) and the Board of Trade of the City of Chicago (CBOT) and executed by nonaffiliated floor brokers.

In particular, the applicant proposed to accept for clearance customer orders that are executed by preapproved execution groups pursuant to "give-up agreements."[3] The applicant expected that the company would initially provide only limited execution services. The company would not be the primary clearing firm for any nonclearing member of the CBOT, and would not qualify any nonclearing member of the CME.

The applicant also sought approval to engage in other FCM and data processing and transmission activities. The applicant committed that the company would conduct these activities according to the provisions and subject to the limitations of Regulation Y (section 225.28(b)(7)(iv) and (b)(14)).[4] The company also planned to engage in certain other activities that the applicant maintained were incidental to its FCM services. These activities included the management of institutional-customer funds under its control. The incidental activities would also include providing to institutional customers, on request, general advice about (1) sources of information, (2) the selection and arrangement of an appropriate execution group, (3) the availability of computer software relating to futures and options on futures, (4) order-placement alternatives, and (5) cost-reduction methods in the use of futures and options on futures for hedging purposes. The company committed that it would not provide investment advice relating to futures and options on futures or on any other matter not authorized by the order.

The Board previously denied a proposal in which a nonbanking subsidiary of a BHC would have cleared, but not executed, trades for professional floor traders (primarily market makers and specialists) trading for their own account on major securities and commodity exchanges. (See 1991 FRB 189 and section 3700.12.) In that order, the Board was concerned that, by not engaging in both the execution and clearance of a trade, the FCM nonbanking subsidiary could not decline transactions that posed unacceptable risk. It would have been obligated to settle each trade entered into by one of its customers, even if the customer did not have the financial resources to honor the obligation. No mechanism existed by which the FCM nonbanking subsidiary could contemporaneously monitor the intra-day trading activities of the floor traders, its primary customers. The Board decided that the proposed nonbanking activity exposed the parent bank holding company to substantial credit risk. This decision was based on (1) the FCM's inability to monitor and control the risks to be undertaken and (2) the fact that the clearing agents had to guarantee the financial performance of their customers to the clearinghouses of the exchanges on which they operate. The public-benefit considerations therefore precluded approval of that application under section 4(c)(8) of the BHC Act.

The applicant's proposal differed from the above-mentioned denied application in various respects. In the applicant's case, the company would not serve as the primary or qualifying clearing firm for any broker that executes its clearing-only trades or for any nonaffiliated customer. The company would clear only trades that it executes, or that other executing brokers execute and the company accepts for clearance pursuant to the customer's give-up agreement.

The applicant represented that, under the give-up agreements, the company would have the contractual right to refuse a customer's trade that exceeded established trading limits that were documented in the give-up agreement for that particular customer. The company would have a period of time within which it could determine if the executed trade was properly authorized according to established limits, and could decide to reject the trade.

The company's customer base would consist of sophisticated institutional investors. The company would review the creditworthiness and other characteristics of each potential customer. Based on that review, it would approve or reject the customer and establish appropriate trading, credit, margin, and exposure limits for the customer. It would accept for clearance only trades that had been executed by preapproved execution groups trading on the CBOT and CME. Company would approve an execution group only if the floor brokers, and their primary or qualifying clearing firms, satisfied the com-

3. Under a give-up agreement, the executing floor broker (or give-in broker), pursuant to a customer's instructions, gives up an executed order for clearance to a clearing member other than the executing broker's primary clearing member (or qualifying member). Such agreements are used primarily to allow institutional customers to select a broker who has superior expertise and execution skills with respect to specific contracts or types of orders, while maintaining their accounts and positions with a clearing firm in which they have financial confidence.

4. Company would not trade for its own account except (1) to hedge a cash position in the related financial instrument or (2) to offset or liquidate a clearing error arising in the normal course of business.

pany's financial, managerial, and operational standards.

The Board decided that the credit and the other risk considerations associated with the proposed nonbanking activities were consistent with requirements for approval. The decision was based on (1) the framework described in the order; (2) the fact that the company would not be the primary or qualifying clearing firm for any broker that executed the company's clearing-only trades, or for any nonaffiliated customer; (3) the other contractual and operational distinctions noted between this proposal and the previous denied application (1991 FRB 189); and (4) the other facts of record.

The Board noted that it had recently approved applications by two bank-affiliated FCMs to engage in clearing-only activities, also on the CBOT and the CME (1993 FRB 723 and 1993 FRB 728). For a brief summary of the initial order, see section 3251.0.3.

The Board approved the application on August 2, 1993 (1993 FRB 961). The approval was subject to the facts of record, all the commitments made by the applicant, and the limitations and conditions stated in the order.

3251.0.5 FCM—EXECUTING AND CLEARING, AND CLEARING WITHOUT EXECUTING, FUTURES AND OPTIONS ON FUTURES ON NONFINANCIAL COMMODITIES

A bank holding company (the applicant, a BHC within the meaning of the BHC Act) applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.3 of the Board's Regulation Y to act, through a wholly owned subsidiary (the company), as a futures commission merchant (FCM) for unaffiliated customers in executing and clearing, and clearing without executing, futures and options on futures on *nonfinancial commodities*. Initially, the applicant proposed to conduct these activities in futures and options on futures on heating oil, crude oil, corn, wheat, soybeans, cattle, and hogs. The applicant must give at least 20 days' written notice to the Federal Reserve before it engages in FCM activities with respect to additional contracts linked to other physical commodities, unless other contracts are approved for any other bank holding company under the BHC Act.

The company is engaged in executing and clearing on major commodities exchanges futures and options on futures on financial commodities and certain broad-based and widely traded stock and bond indices.[5] The company proposed to engage in its proposed activities on the CBOT, CME, and New York Mercantile Exchange (NYMEX).

The company *will not* trade in the proposed derivative instruments for its own account. However, when a customer defaults on a contract after the termination of futures trading and the company is required to make or take delivery of the underlying commodity, or when it exercises its right to liquidate a customer's account, the company is permitted to take the necessary actions to mitigate its damages. These actions include acting for its own account in retendering or redelivering the commodity, entering into an exchange-for-physical transaction, or entering into an offsetting transaction in the cash market, provided these and other appropriate actions are taken as soon as practicable.

The company will limit its proposed services only to institutional customers and will not provide such services to retain brokerage customers, locals, or market makers. Approximately 10 percent of its business will be conducted on behalf of managed commodity funds (regulated by the Commodity Futures Trading Commission (CFTC) and the National Futures Commission). None of the managed funds would be owned, sponsored, advised by, or otherwise affiliated with the applicant. The company will not act as a commodity trading advisor,[6] or otherwise provide investment advice on the proposed instruments.

The Board had not previously approved the execution and clearance by bank holding companies of futures and options on futures on nonfinancial commodities. The Board's approval had been limited to acting as an FCM in the execution and clearance on major commodities exchanges of futures and options on futures on a variety of financial commodities, such as gold

5. See 1985 FRB 970. The company already engages in FCM activities on the Chicago Mercantile Exchange (CME), Chicago Board of Trade (CBOT), Commodity Exchange, London International Financial Futures and Options Exchange, Marche a Terme International de France, and Singapore International Monetary Exchange.

6. As defined in the Commodities Exchange Act, a commodity trading advisor includes, with certain exceptions, ''any person who, for compensation or profit, engages in the business of advising others, either directly or through publications or writings, as to the value of commodities or as to the advisability of trading in any commodity for future delivery on or subject to the rules of any contract market, or who for compensation or profit, and as part of the regular business, issues or promulgates analyses or reports concerning commodities.'' (7 U.S.C. 2)

and silver bullion and coins, foreign exchange, government securities, certificates of deposit and money market instruments that banks may buy and sell for their own accounts, and stock and bond indices.[7]

3251.0.5.1 BHC's Execution and Clearance of Futures and Options on Futures on Nonfinancial Commodities

National banks engage in a broad range of FCM activities involving all types of exchange-traded futures and option contracts consisting of financial and nonfinancial commodities for the accounts of customers, and for their own accounts, for hedging purposes. The Office of the Comptroller of the Currency (OCC) reasoned that the clearing process for any futures contract or option on a futures contract involves essentially an extension of credit because, upon receiving an executed order from a customer, the clearing broker supplies its own credit in an order on behalf of the customer and then sends the order to the exchange clearing organization for settlement. The OCC also determined that the execution, clearance, and advisory services provided by an FCM to its customers are essentially the same whether or not the underlying commodities are financial or nonfinancial.

Some national banks act as an FCM in the execution and clearance of futures and options on futures on a broad array of financial and nonfinancial commodities. The state of New York Banking Department has also permitted several New York–chartered banks to engage, to a limited extent, in FCM activities involving derivative instruments on nonfinancial commodities.

The Board has previously authorized bank holding companies to conduct FCM activities involving numerous instruments based on financial commodities. The Board determined that acting as an FCM in connection with contracts involving nonfinancial commodities is operationally and functionally similar to conducting FCM activities with respect to derivative contracts involving financial commodities. In both instances, the FCM monitors customer credit risk and trading exposure; assesses and collects initial and maintenance margins from customers; and brokers, executes, and clears trades.

Acting as an FCM for derivative instruments involves functions, skills, risks, and expertise that are substantially similar to those associated with the execution and clearance of financial futures and option contracts that the Board previously approved. The mechanics of executing and clearing trades are operationally the same whether the commodity underlying the exchange-traded derivative instrument is financial or nonfinancial. The rules and regulations of the CFTC, as well as the rules, procedures, practices, capital requirements, and safeguards of the various commodities exchanges, govern both the execution and clearance of nonfinancial futures and options and the execution and clearance of financial futures and options.

In 1991, the Board permitted bank holding companies to provide investment advice on trading futures contracts and options on futures contracts in nonfinancial commodities, such as agricultural and energy commodities. (See 1991 FRB 126.) It concluded that (1) providing investment advice on investing in futures and options on nonfinancial commodities appeared to be the functional equivalent of providing advice on futures and options on futures on financial commodities and (2) exchange-traded futures and options on futures involving nonfinancial commodities were essentially financial instruments.

The Board concluded, based on an analysis of the range of FCM activities currently existing in banking (as summarized above and cited in the order), that the activity of acting as an FCM in the execution and clearance of futures and options on futures on nonfinancial commodities, as proposed by the applicant, is an activity that is closely related to banking for the purposes of the BHC Act.

3251.0.5.2 FCM's Execution and Clearance of Futures and Options on Futures on Nonfinancial Commodities

The Board noted that both the company and the commodities exchanges on which the proposed FCM activities would be conducted are subject to regulatory oversight by the CFTC. The company's trading and clearance activities would also be subject to regulation and review by the CFTC and the commodities exchanges. The

7. See section 225.28(b)(7)(iv) of Regulation Y (12 C.F.R. 225). See also 1985 FRB 251, 1985 FRB 111, 1977 FRB 951, and 38 *Federal Register* 27,552 (1973). The applicant's proposed clearing without execution activities were approved in 1993 (FRB 723–728). The company proposed to conduct its clearing-only activities subject to the same conditions and limitations set forth in these Board orders, including the use of the "give-up agreement" by and among the company, its customers, and the nonaffiliated executing FCM that allows the company to refuse to clear trades that exceed specified risk parameters.

applicant committed to conduct the proposed activities subject to the same rules and procedures the Board imposed on FCM activities in derivatives of financial commodities, including prohibitions on extending credit to customers for the purpose of meeting margin requirements. The applicant committed to take several further steps in the event that one of the company's customers has an open position in a contract after futures trading is ceased, and the customer is not willing or is unable to make or take delivery. Based on the commitments made by the applicant for conducting the proposed activities, the limitations on the activities cited in the order, and all the facts on record, the Board approved the application on September 28, 1993, subject to all the terms and conditions set forth in the order and the noted Board regulations and orders that relate to the proposed activities. (See 1993 FRB 1049.)

3251.0.6 FCM AND RELATED ADVISORY SERVICES FOR OPTIONS ON EUROTOP 100 INDEX FUTURES AND THE ONE-MONTH CANADIAN BANKER'S ACCEPTANCE FUTURES

A foreign bank (the applicant) subject to the provisions of the BHC Act applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.23 of Regulation Y for its section 20 subsidiary (the company) to act as an FCM for and provide advisory services to nonaffiliated persons, in connection with the purchase and sale of futures and options on futures contracts that are based on bonds or other debt instruments; certain commodities; or stock, bond, or commodity indices. The applicant proposed contracts that were not previously considered by the Federal Reserve System: options on Eurotop 100 Index futures, to be traded on the Commodity Exchange, Inc. (Eurotop contracts), and the one-month Canadian Banker's Acceptance Futures, to be traded on the Montreal Exchange (banker's acceptance futures). These contracts are based on a financial instrument or a broad-based financial index and are comparable to contracts previously considered by the Federal Reserve System. They have essentially the same terms and serve the same functions as futures and options contracts for which FCM and related advisory services have been approved by the Board under section 4(c)(8) of the BHC Act. The Board concluded that the skills necessary to engage in providing FCM and futures advisory services are the same as those used to provide such services with regard to previously approved contracts. The Board thus approved the applicant's provision of these FCM and related advisory services for these contracts by the company, concluding that the activity is closely related to banking within the meaning of section 4(c)(8) of the BHC Act. (See 1995 FRB 188–189.)

3251.0.7 FCM TRADING FOR ITS OWN ACCOUNT IN FUTURES, OPTIONS, AND OPTIONS ON FUTURES CONTRACTS BASED ON CERTIFICATES OF DEPOSIT OR OTHER MONEY MARKET INSTRUMENTS

A foreign bank (the applicant) subject to the provisions of the BHC Act applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.23 of Regulation Y for its section 20 subsidiary (the company) to trade as an FCM in all futures, options, and options on futures contracts based on certificates of deposit or other money market instruments that are permissible investments for national banks. The Board had previously authorized company to trade for its own account, for purposes other than hedging, in futures, options, and options on futures contracts based on U.S. government securities that are permissible investments for national banks and in similar contracts based on certain money market instruments. (See 1991 FRB 759.) In that order, the Board noted that trading in these contracts would require a market judgment on interest rates. It was noted that banks, through their core lending and funding activities, had developed expertise in judging interest-rate and price movements. For those reasons, and because that proposal would not authorize company to trade in derivative contracts based on securities or instruments that a state member bank could not purchase for its own account, the Board determined the trading activity to be closely related to banking under section 4(c)(8) of the BHC Act.

The Board concluded that its reasoning in the 1991 order could be applied currently to this expanded 1994 proposal. The Board noted that the Office of the Comptroller of the Currency had determined that trading in futures and options contracts based on bank-eligible securities or instruments is an activity that is within the legally authorized powers of national banks (OCC Interpretive Letter No. 494 (December 20, 1989)). The Board thus concluded that the proposed trading activity is conducted by banks and is so operationally and functionally similar to activities conducted by banks that banks are particularly well-equipped to engage in the activity. It therefore concluded that trading for one's own account, for purposes other than hedging, in futures, options, and options on futures contracts based on certificates of deposit or other money market instruments that are permissible investments for national banks is an activity that is closely related to banking within the meaning of section 4(c)(8) of the BHC Act. (See 1995 FRB 190.)

3251.0.8 FCM ENGAGING IN COMMODITY AND INDEX SWAP TRANSACTIONS AS AN ORIGINATOR, PRINCIPAL, AGENT, BROKER, OR ADVISOR

A foreign bank (the applicant) subject to the provisions of the BHC Act applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.23 of Regulation Y for its section 20 subsidiary (the company) to engage in FCM activities and in acting as an originator, principal, agent, broker, or advisor with respect to swaps and swap-derivative products and over-the-counter option transactions based on certain commodities; stock, bond, or commodity indices; or a hybrid of interest rates and these commodities or indices (commodity and index swap transactions).[8] Except for certain advisory services, the Board had not determined whether these proposed activities are closely related to banking under section 4(c)(8) of the BHC Act. The Board had determined, by order or regulation, that acting as an originator, principal, broker, agent, or advisor with respect to interest-rate and currency swaps and swap-derivative products relating thereto (financial swap transactions) are activities closely related to banking and are thus permissible for bank holding companies. (See Regulation Y, section 225.28(b)(6) and 1993 FRB 345.)

8. The proposed activities are subject to the same commitments relating to interest-rate and currency swap transactions and related swap-derivative products. (See 1993 FRB 345.)

The applicant anticipates that the section 20 subsidiary's swap transactions will be based on a variety of stock and bond indices, similar to those previously approved in connection with proposed FCM activities (or to a specially tailored basket of securities selected by the parties) (index transactions), or they could be based on precious metals and energy products or related commodity indices (commodity transactions). They also could include hybrid transactions that are based on a combination of interest rates and such indices or commodities.

Commodity and index swap transactions are operationally, structurally, and functionally similar to financial swap transactions. Both types of swaps involve privately negotiated financial transactions. The parties involved in the transaction agree to exchange specified payment streams over a specific period of time, based on a predetermined formula. For an interest-rate swap, the basic structure is an exchange between two counterparties of the payment streams that arise out of different interest payment obligations, calculated on the basis of an agreed-upon notional principal amount. With the commodity or index swap transaction, the parties exchange payment streams based on a notional principal amount and the prices of certain commodities or the value of or returns on certain securities or indices of securities, or on a combination of these and other measures such as interest rates. For both types of swap transactions, the parties enter into these contracts to meet various common investment objectives, including taking positions in the market for the underlying assets for investment purposes, limiting one's exposure to market uncertainties and future price fluctuations, and preserving principal while participating in the potential returns of a particular financial market or economic sector. Since a swap transaction is negotiated between parties, the economic terms of the transaction (including the duration of the contract; notional principal amount; method of calculating and frequency of payments; and underlying assets, rates, or indices upon which the payments are to be determined) can be individually tailored to meet specific financial goals and risk sensitivities of the counterparty.

National banks have been authorized by the OCC to engage in activities that involve matched and unmatched commodity and index swap transactions (including related swap-derivative products and over-the-counter options). The New York State Banking Department also approved these activities for state-chartered banks under its jurisdiction. In addition, the Board permits state member banks to enter into perfectly matched commodity and index swap transactions, provided the transactions are consistent with their state charters. Further, the Federal Reserve Bank of New York, acting under delegated authority, has approved proposals by state member banks to engage in such activities on an unmatched basis. (See 12 C.F.R. 208.128.)

For the foregoing reasons and based on the facts of record, the Board determined that engaging in commodity and index swap transactions is an activity conducted by banks. The Board also considered the similarities between these transactions and the financial swap transactions noted above, as well as the fact that banks and other intermediaries play a similar role in financial swap transactions and commodity and index swap transactions. It was noted that all of these contracts represent forms of financial intermediation that banks have historically engaged in. Based on all the facts on record, the Board concluded that these proposed activities are closely related to banking under section 4(c)(8) of the BHC Act.

As noted previously, the company also proposes to provide advisory, agency, and brokerage services with respect to commodity and index swap transactions. The Board believes that the authority of banks to conduct these activities could be implicit in or incidental to their authority to engage in the transactions as principal. In its analysis, the Board noted that banks can develop a familiarity and expertise as to the structure and economic effects of these transactions, which should well equip them to provide the intended advisory, agency, and brokerage services. National banks have been expressly authorized to provide advisory, execution, and other services with respect to exchange-traded futures and options on futures contracts based on financial and nonfinancial commodities. (See OCC Interpretive Letter No. 494.) The exchange-traded transactions are used for purposes similar to the over-the-counter transactions for which the applicant proposes that the company render advisory, agency, and brokerage services. The pricing bases for, economic effects of, and risk presented by the two types of transactions are also similar in important respects.

Based on the facts on record, the Board determined that the proposed advisory, agency, and brokerage services are activities conducted by banks or are operationally and functionally similar to such activities. Thus, they are closely related to banking under section 4(c)(8) of the BHC Act. (See 1995 FRB 190–191.)

3251.0.9 FCM TRADING IN FUTURES, OPTIONS, AND OPTIONS ON FUTURES CONTRACTS BASED ON COMMODITIES OR ON STOCK, BOND, OR COMMODITY INDICES FOR ITS OWN ACCOUNT

A foreign bank (the applicant) subject to the provisions of the BHC Act applied for the Board's permission under section 4(c)(8) of the BHC Act and section 225.23 of Regulation Y for its section 20 subsidiary (the company) to engage in *trading for its own account* for purposes other than hedging in futures, options, and options on futures contracts based on certain commodities or on stock, bond, or commodity indices—transactions that have not been expressly authorized for banks. The instruments to be traded are generally the same as those previously approved by the Board in considering FCM and futures advisory activities of bank holding company subsidiaries, such as crude oil futures, Standard & Poor's 500 Stock Price Index futures, and municipal bond index futures. (See 1993 FRB 1,049 and 1994 FRB 151 and also SR-93-27 (refer to Appendix A).) The applicant proposes to engage in FCM activities and go beyond furnishing those FCM and related advisory services and seeks the Board's permission for the company to trade these instruments for its own account. Such activities include arbitrage operations, market making for customer-accommodation purposes, and proprietary trading (taking positions for investment purposes), as well as hedging transactions.

The proposed activities could consist of exchange-traded instruments that could be based on commodities such as crude oil, providing for delivery of the underlying commodity upon expiration of the contract. The applicant confirmed that it does not intend to take delivery of such commodities but plans to take several actions to avoid delivery of commodities other than precious metals. These actions include closing positions in expiring contracts during trading periods and engaging in exchange-for-physical transactions after trading closes. The Board stipulated, as a condition of approval, that the applicant could not take delivery of the commodities, except in unusual circumstances. Whenever delivery is taken, the applicant is required to notify the Federal Reserve System and divest itself of the commodity promptly. The Board views the contracts as financial instruments, despite the possibility that trading in such contracts can result in the delivery and ownership of commodities that banking organizations are generally not permitted to hold. The Board also noted, with respect to the proposed exchange-traded transactions that are based on an index of securities or commodities, that (1) the transactions would be settled in cash and (2) they would not provide for the delivery of the underlying securities or commodities.

The Board had not previously approved this trading activity, with respect to the instruments proposed, for bank holding companies or their subsidiaries under section 4(c)(8) of the BHC Act. The Board has, however, authorized acting as an FCM and providing advisory services with respect to the instruments to be traded. The Board also approved similar trading with respect to instruments based on U.S. government securities and money market instruments. (See 1991 FRB 759.) With respect to section 20 nonbank subsidiaries, the Board has recognized the utility of trading in these instruments to hedge market exposure resulting from other trading activities, indicating that these bank holding company subsidiaries may engage in such risk-management transactions as a necessary incident to their underwriting and dealing activities. (See 1994 FRB 449.) No federal bank regulatory authority had expressly permitted banks to trade in the proposed instruments for their own accounts for purposes other than hedging.

The Board believes that the proposed trading activities are closely related to banking. It noted that banks engage in activities with respect to the instruments in question that are similar to or related to the proposed trading activities and that they engage in trading activities for the same purposes with respect to similar instruments, including exchange-traded contracts based on bank-eligible securities and instruments and over-the-counter transactions based on commodities and various indices.

The Board further noted that banking organizations have substantial experience with exchange-traded derivative transactions based on commodities or on commodity or securities indices. It also noted important similarities between the proposed instruments and transactions that have been authorized for banks for nonhedging purposes. Moreover, the Board believes that the risks inherent in the proposed trading activities are similar to those that are experienced by banks that engage in swaps and other permissible transactions; hence, the proposed transactions require analytical skills; risk-management policies, procedures, and techniques; and computer and operations systems similar to those used by banks for engaging in those permissible transactions. Based on this reasoning, the Board determined the proposed activity to be closely related to banking under section 4(c)(8) of the BHC Act. The Board's December 23, 1994, approval is subject to all the facts of record, all the commitments made in connection with the application, and the conditions cited in the order. (See 1995 FRB 185.) These include adhering to future supervisory or examination policies and guidance issued by the Board for a banking organization's derivatives business, including policies or guidance with respect to customer transactions, trading and marketing practices and policies, and related systems and controls.

3251.0.10 APPENDIX A—PREVIOUS PRIOR-APPROVAL REQUIREMENTS FOR BANK HOLDING COMPANIES PROPOSING TO ENGAGE IN FCM ACTIVITIES

In May 1993, the Board reduced the prior-approval requirements for bank holding companies proposing to engage in certain futures commission merchant (FCM) activities. (See SR-93- 27.) First, the Board delegated to Reserve Banks its authority to approve proposals by bank holding companies to act as an FCM in executing and clearing any futures contract on a financial commodity or stock or bond index that the Board has previously approved, on any Board-approved exchange. The Board also delegated to Reserve Banks its authority to approve proposals by bank holding companies to act as an FCM or commodity trading advisor in providing investment advisory services for previously approved financial instruments.

In addition, the Board modified and, in certain cases, eliminated the prior-approval requirement for bank holding companies seeking to act as an FCM for additional financial instruments or to act as an FCM on additional exchanges in which the bank holding company already has Federal Reserve System approval to engage generally in FCM activities. Any bank holding company that had previously received approval to act as an FCM under either Board order or the former sections 225.25(b)(18) and (b)(19) of Regulation Y could act as an FCM subject to certain limitations and conditions. These requirements were replaced by the April 1997 Regulation Y revision at section 225.28(b)(7)(iv).

3251.0.11 PROVIDING DISCRETIONARY PORTFOLIO MANAGEMENT SERVICES ON FUTURES AND OPTIONS ON FUTURES ON FINANCIAL COMMODITIES

A foreign bank (the applicant), a bank holding company within the meaning of the BHC Act, applied under section 4(c)(8) of the act to engage through company in providing discretionary portfolio management services with respect to exchange-traded futures and options on futures on financial commodities.[9] The provision of discretionary portfolio management services, with respect to futures and options on futures on financial commodities, had not been previously considered by the Board as to whether it is closely related to banking under section 4(c)(8) of the act.

In providing discretionary management services, company would manage customers' accounts and purchase and sell in its sole discretion exchange-traded futures and options on futures on financial commodities for such accounts. Company would provide discretionary management services in combination with providing futures commission merchant (FCM) transactional services and would only provide such services to institutional customers.[10] Company would not act as a counterparty on customer transactions or trade these instruments for its own account. In addition, company would not purchase or sell over-the-counter contracts for accounts over which it exercises discretion.

The Board has permitted bank holding company FCMs and commodity trading advisors to provide investment advice with respect to futures and options on futures on financial and nonfinancial commodities. (See Regulation Y, section 225.28(b)(6) and 1994 FRB 151.) The bank holding company argued that discretionary management is a normal manner of providing investment advice to institutional customers. Indeed, the Board permits bank holding companies to act as discretionary portfolio managers as part of providing investment advisory and full-service brokerage services with respect to securities. (See Regulation Y, section 225.28(b)(6) and (b)(7)(i).) In addition, the Office of the Comptroller of the Currency permits national banks to engage in discretionary funds management with respect to futures and options on futures.[11]

The applicant also indicated that company would provide the proposed futures-related discretionary portfolio management services in accordance with the limitations and conditions that would be imposed if company were providing portfolio management services in the securities context. In this regard, the applicant committed that company would only provide the proposed discretionary portfolio management services to institutional customers and only at the request of such customers.

The applicant also indicated that it would have a fiduciary relationship with all customers to whom it provides the proposed discretionary management services and has committed that company would comply with applicable law, including fiduciary principles. As one method of meeting its fiduciary obligations, the bank holding company committed that company would obtain the consent of customers before engaging, as principal or agent, in a transaction in which any affiliate of company acts as principal in futures or options on futures transactions on the customer's behalf. Company and its affiliates also agreed not to share any confidential information concerning their respective customers without the consent of the customer. In addition, the applicant stated that company would exercise its discretionary management authority only in purchasing and selling exchange-traded instruments. Therefore, concerns surrounding over-the-counter instruments, such as the potential for abuses due to the lack of price transparency, were not presented by the proposal.

For these reasons, the Board concluded that providing discretionary portfolio management services with respect to futures and options on futures on financial commodities is closely related to banking and a proper incident to banking for purposes of section 4(c)(8). The application was approved by the Board on February 9, 1995. (See 1995 FRB 386.)

9. The bank holding company also proposed to engage in a variety of data processing, securities, futures, and foreign exchange–related activities through company and another subsidiary. The Board previously has determined by order or regulation that these activities are closely related to banking. The bank holding company committed to conduct these activities in accordance with the conditions established by the Board in Regulation Y and prior orders.

10. Company would provide these services to commodity pools but would not become a commodity pool operator.

11. See OCC Interpretive Letter No. 494 (December 20, 1989).

3251.0.12 FCM EXECUTION, CLEARANCE, AND ADVISORY SERVICES FOR CONTRACTS ON FINANCIAL AND NONFINANCIAL COMMODITIES FOR NONINSTITUTIONAL CUSTOMERS

A foreign banking organization (the notificant) subject to the provisions of the Bank Holding Company Act (BHC Act) provided notice under section 4(c)(8) of the BHC Act (12 U.S.C. 1843(c)(8)) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) of its proposal that its indirect U.S. subsidiary (the indirect subsidiary)[12] acquire certain assets and assume certain liabilities of a company.[13] The notificant would engage indirectly in FCM execution, clearance, and advisory activities with respect to futures and options on futures on financial and nonfinancial commodities[14] and in buying and selling foreign exchange in the spot, forward, and over-the-counter options markets on the order of investors as riskless principal.[15] The Board had previously determined by order and regulation that the above proposed activities are closely related to banking within the meaning of section 4 of the BHC Act.[16]

3251.0.12.1 Providing FCM Services to Certain Sophisticated Noninstitutional Customers

First, the notificant proposed that the indirect subsidiary would provide FCM execution, clearance, and advisory services with respect to contracts on both financial and nonfinancial commodities to persons that do not qualify as institutional customers but who trade futures and options on futures solely to hedge risks arising from their business activities (noninstitutional commercial hedger customers), such as farmers. The Board has limited bank holding companies to providing nonfinancial commodities–related FCM services only to institutional customers. Similarly, with respect to contracts on financial commodities, the Board

12. The indirect subsidiary is wholly owned by the notificant. The indirect subsidiary engages in various futures commission merchant, foreign-exchange, and securities-related activities. See 1994 FRB 646 and 649.

13. The acquired firm was a clearing member of certain financial and nonfinancial commodities exchanges. The FBO stated that the indirect subsidiary would become a clearing member of those exchanges. In addition, that subsidiary would provide FCM services with respect to two exchange-traded contracts that had not previously been approved by the Board (heating oil crack-spread options and gasoline crack-spread options) and would purchase and sell through the use of omnibus account arrangements certain futures and options on futures on nonfinancial commodities traded on two other exchanges.

14. These activities include providing execution-only and clearing-only services to customers. See 1993 FRB 723 and 1994 FRB 151.

15. The indirect subsidiary would provide the proposed riskless-principal services only to institutional customers, except that it would provide such services to certain noninstitutional customers when they direct it to convert funds from one currency to another to trade futures and options on futures contracts. Foreign exchange–related advisory services would not be provided to these noninstitutional customers.

16. See 12 C.F.R. 225.28(b)(7)(iv) and 225.28(b)(6) and 1990 FRB 649 (1990).

has not permitted bank holding companies to provide execution-only or clearing-only services to noninstitutional customers and only permits bank holding companies to provide advisory services to financially sophisticated customers that have significant dealings in the underlying commodities.[17]

The indirect subsidiary's noninstitutional commercial hedger customers would be engaged or would be affiliated with a commercial enterprise that is engaged in producing, manufacturing, processing, or merchandising products or in providing services that are related to the commodities underlying the futures and options on futures contracts in which the customers would trade. The noninstitutional commercial hedger-customers would not be engaged in executing their own trades on the floor of any commodities exchanges. The notificant stated that the indirect subsidiary would require noninstitutional commercial hedger customers to state in writing that they would only engage in ''bona fide hedging transactions,'' as defined by the Commodity Futures Trading Commission (CFTC).[18] In addition, an initial credit-review process will be established to determine whether a noninstitutional commercial hedger customer's proposed hedging activities are appropriate in light of the customer's net worth and business activities. The indirect subsidiary will not permit noninstitutional commercial hedger customers to trade in any commodities other than those that the customer would trade to hedge risks from its commercial activities, and it would establish a system to detect any unauthorized trading activities.

By limiting transactional services and advice to areas in which the customer has special expertise, the proposed limitations address the concern that the customer would rely unduly on the bank holding company's advice or that the customer would be unable to detect conflicts of interest or advice that is motivated by the bank holding company's self-interest. Moreover, the notificant will abide by all the other limitations designed to more specifically address the potential risks that may result from providing clearing-only and execution-only services to these customers.

3251.0.12.2 Foreign-Exchange Activities

Second, in connection with the proposal that the indirect subsidiary will buy and sell foreign exchange on the order of customers as riskless principal, the notificant proposed that the indirect subsidiary be permitted to purchase and sell foreign exchange for its own account for limited purposes while also providing foreign-exchange-related execution and advisory services.[19] In several limited circumstances, the Board has permitted a bank holding company to provide foreign-exchange-related transactional and advisory services in a subsidiary that purchases and sells foreign exchange for its own account.[20] For example, the Board has permitted bank holding companies to provide foreign-exchange-related advice and transactional services through a subsidiary engaged in purchasing and selling foreign exchange for its own account to hedge positions in permissible interest-rate or currency-swap transactions or to hedge risks arising from the permissible securities underwriting and dealing activities of the subsidiary.[21]

The indirect subsidiary will take positions in foreign exchange only as a means to hedge financial-statement translations of income for its foreign parent and as necessary for the payment of invoices denominated in foreign currencies. It would not enter into a foreign-exchange transaction for its own account with a customer if the customer is receiving foreign-exchange services relating to such transaction from this subsidiary. The notificant committed that the indirect subsidiary will observe the standards of care and conduct applicable to fiduciaries with respect to its foreign-exchange-related advisory activities and will provide foreign-exchange-related execution and advisory services only to institu-

17. See 1993 FRB 1049 and 12 C.F.R. 225.25(b)(19) (contracts on financial commodities). These limitations address concerns that, in futures transactions, unsophisticated customers may place undue reliance on investment advice received from a banking organization and may not be able to detect investment advice that is motivated by the advisor's self-interest. Similarly, in cases involving clearing-only transactions, the limitation helps address the added risk to the bank holding company that results from its more limited ability to review and reject trades that have been executed through another FCM.

18. See 17 C.F.R. 1.3(z).

19. The indirect subsidiary currently provides foreign-exchange-related execution and advisory services to its customers. In permitting bank holding companies to provide foreign-exchange execution and advisory services on a combined basis, the Board has relied on the representation that the subsidiary providing the foreign-exchange-related services would not purchase or sell foreign exchange for its own account.

20. The Board also previously has noted that in conducting foreign-exchange operations, commercial banks combine the functions of giving advice, executing transactions, and taking positions in foreign exchange.

21. See 1994 FRB 157 and 1993 FRB 892.

tional customers. The notificant also committed that the indirect subsidiary's personnel engaged in purchasing and selling foreign exchange for its own account will not have access to information about the foreign-exchange trading activities of customers and that customer representatives will not have access to information about the foreign-exchange activities of personnel engaged in purchasing and selling foreign exchange for the indirect subsidiary's own account.[22]

3251.0.12.3 Board's Decision on the Proposed FCM Activities

Based on the foregoing and all the facts of record, the Board approved the notification subject to all the terms and conditions set forth in the order and in the above-noted Board regulations and orders that relate to these activities. The Board's determination is subject to all the terms and conditions set forth in the Board's Regulation Y, including those in sections 225.7 and 225.23(b). The Board's decision is specifically conditioned on compliance with all the commitments made. The notice was approved on July 14, 1995 (see 1995 FRB 880).

3251.0.13 FCM SERVING AS A PRIMARY CLEARING FIRM FOR A LIMITED NUMBER OF FLOOR TRADERS AND BROKERAGE SERVICES FOR FORWARD CONTRACTS ON FINANCIAL AND NONFINANCIAL COMMODITIES

A foreign banking organization and its parent holding companies (the notificants), bank holding companies within the meaning of the Bank Holding Company Act, requested the Board's approval under section 4(c)(8) of the BHC Act (12 U.S.C. 1843(c)(8)) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) to acquire all the voting securities of a company (the company) and thereby engage in a wide range of nonbanking activities, including securities- and derivatives-related activities. The company and its principal subsidiary (the subcompany) engage worldwide in a wide range of investment advisory, securities underwriting, and futures-related activities. The notificants proposed to merge the subcompany and the company into the notificants' existing nonbank section 20 company (the section 20 company). The section 20 company would continue as a registered broker-dealer with the Securities and Exchange Commission under the Securities Exchange Act of 1934 and as a member of the National Association of Securities Dealers. The section 20 company would also become registered as a futures commission merchant (FCM) and a commodity trading advisor (CTA).[23]

The notificants proposed to engage in a variety of FCM-related activities the Board previously had determined, by regulation or order, were so closely related to banking as to be proper incidents thereto within the meaning of section 4(c)(8) of the BHC Act. The proposed activities included engaging in execution-only, clearing-only, and omnibus account activities with respect to futures and options on futures based on financial and nonfinancial commodities, and providing discretionary portfolio management services with respect to futures and options on futures on financial and nonfinancial commodities.[24] (See 1997 FRB 138–142.) The section 20 company committed to providing these futures-related execution-only, clearing-only, and discretionary portfolio management services only to institutional customers and certain sophisticated noninstitutional commercial hedger customers.[25]

3251.0.13.1 Primary Clearing Firm for a Limited Number of Professional Floor Traders

The notificants also proposed that the section 20

22. To address potential conflicts of interest in connection with providing the proposed foreign-exchange riskless-principal services, the notificant committed that the indirect subsidiary will disclose to each customer that receives advice relating to over-the-counter transactions in the foreign-exchange market that it may have an interest as a counterparty principal in the course of action ultimately chosen by the customer. Also, in any case in which the indirect subsidiary has an interest in a specific over-the-counter foreign-exchange transaction as counterparty principal, it will advise its customer of that fact before recommending participation in that transaction.

23. The subcompany was already registered as an FCM and CTA.

24. The notificants committed that the section 20 company would provide these services in accordance with the limitations previously established by the Board. See 1993 FRB 723, 1993 FRB 1049, and 1994 FRB 151.

25. The notificants stated that all noninstitutional commercial hedger customers would meet the requirements previously reviewed by the Board. See 1995 FRB 880.

company provide clearing-only services to, and serve as the primary clearing firm for, certain professional floor traders on two exchanges with respect to the futures contracts and options on futures contracts traded on such exchanges.[26] The Board previously has determined that providing clearing services with respect to exchange-traded securities, options, futures, and options on futures contracts is closely related to banking within the meaning of section 4(c)(8) of the BHC Act. In 1991, however, the Board denied an application by the notificants to engage de novo in providing the proposed services to an unlimited number of market makers and other professional floor traders dealing for their own accounts.[27]

In the 1991 order, the Board recognized that a company serving as the primary clearing firm for professional floor traders may be exposed to significant financial risks because the company generally would not have the ability to reject an executed trade presented to it for clearance, even when the company believes the trade presents unacceptable risks in light of market conditions or the traders' financial position. The Board also noted that, at the time of the 1991 application, the applicants lacked appropriate operational systems to track and manage the intraday risks arising from the trading activities of the floor traders. This lack of a mechanism to monitor intraday trading activities presented the possibility that a professional floor trader could incur substantial losses through the trading of options or futures contracts, which the applicants would be obligated to clear and guarantee, before the applicants could act to mitigate their credit-risk exposure.

It was noted that since 1991, the Board and bank holding companies have gained substantial experience with the conduct, methods, procedures, and regulation of clearing-only activities. Also, since 1991, the Board had authorized bank holding companies to provide clearing-only services with respect to futures contracts and options on futures contracts for customers other than professional floor traders, subject to certain conditions designed to ensure that the bank holding companies have the ability to manage the attendant financial risks.[28]

The Board concluded that the facts of record indicated that the subcompany had and the section 20 company would have sufficient risk-management policies, procedures, and systems to permit the notificants and the section 20 company to adequately monitor and control the risks, including the intraday risks, associated with the section 20 company's proposal to serve as the primary clearing firm for a limited number of professional floor traders on the two exchanges. Specifically, the section 20 company would use the subcompany's established trading, credit, margin, and exposure limits for each professional floor trader for which the section 20 company serves as the primary clearing firm. Adherence to these limits is monitored on an intraday basis by experienced personnel who are physically present on the floor of the two exchanges. These personnel visually monitor the trading activities of floor traders on the exchanges and review trades submitted by the floor traders for clearance.[29] If an employee of the section 20 company determines that a floor trader is exceeding the limits it has established, or is otherwise engaged in questionable trading activities, the employee would have the ability

26. A primary clearing firm is obligated to accept and clear all trades submitted by a professional floor trader, even if the trade was initially presented to, and rejected by, another clearing firm. Once a primary clearing firm clears a trade for a professional floor trader, the firm becomes obligated to settle the trade in the event of a default by the professional floor trader. The company served as the primary clearing firm for professional floor traders on the two exchanges. The notificants requested authority for the section 20 company to act as the primary clearing firm for up to 20 professional floor traders on one exchange and 40 professional floor traders on the other.

27. See 1991 FRB 189.

28. In particular, the bank holding companies agreed to provide the clearing-only services pursuant to ''give-up'' agreements, which provide the bank holding companies with the right to refuse to accept for clearance any customer trade that the bank holding company deems unsuitable in light of market conditions or the customer's financial situation or objective. In addition, the bank holding companies agreed to establish procedures to monitor the intraday trading activities and risk exposure of their clearing-only customers.

29. The Board recognizes that trades on the two relevant exchanges are not electronically submitted to the clearing firm or the exchange. Instead, trading cards for each trade are submitted by each professional floor trader to its clearing firm, which enters the trade into the exchange's clearing system. Both exchanges require that the subcompany collect the trading cards from each floor trader at least once during each half-hour period, thereby providing the subcompany personnel with an opportunity to review the intraday trading activities of floor traders. The rules of one exchange also require that the subcompany enter all collected trades into the exchange's on-line clearing system within 45 minutes of the end of the half-hour period during which the trades were collected. That exchange's on-line clearing system also permits the subcompany to monitor the trading activities of floor traders, both individually and in the aggregate, on an intraday basis, and allows the subcompany to identify any potentially unmatched trades. Although the other exchange does not operate an on-line clearing system, the subcompany personnel maintain tally sheets that are updated every 30 minutes and reflect all trades submitted by each professional floor trader throughout the day.

to limit or halt the floor trader's activities, require the floor trader to post additional margin, partially or entirely liquidate the floor trader's positions, or immediately revoke the floor traders membership on the exchange.[30] The notificants' operations managers on the two exchanges also would personally guarantee the section 20 company against any losses that it may incur from serving as the primary clearing firm for floor traders on the exchanges, thereby providing such personnel with an incentive to closely monitor the trading activities of the floor traders. The notificants also stated that the section 20 company would install an on-line risk-management system that would provide its personnel with intraday data on the trading activities of the professional floor traders, and the ability to analyze its exposure to such trading activities on an intraday basis.

The Board noted that the type of risk-management systems necessary to appropriately manage the risks arising from a particular activity necessarily depends on the scope and nature of the proposed activity. In this regard, the Board noted that the section 20 company proposed to serve as the primary clearing firm for only a limited number of professional floor traders on two exchanges. These exchanges have relatively small trading areas and volumes, which permit personnel on the floors of the exchanges to monitor trading activity. The Board noted that the Federal Reserve Bank had conducted an on-site operational and managerial infrastructure review used by the subcompany to monitor and control the financial risks associated with its primary clearing activities on the two exchanges. Based on that review and other facts of record, the Board concluded that the subcompany had the managerial and operational resources and systems to adequately monitor and control the financial risks arising from its role as primary clearing firm on the two exchanges.

The Board also noted that approval of the proposal could reasonably be expected to produce public benefits. Specifically, the Board noted that the subcompany served as the primary clearing firm for a significant percentage of the professional floor traders on the two exchanges and that the notificants' proposal would permit the section 20 company to continue providing primary clearing services to such professional floor traders.

In light of all the facts of record, including the limited nature of the section 20 company's proposed clearing-only activities for professional floor traders, the commitments provided by the notificants, and the operational and managerial systems that the section 20 company will have in place to monitor and control the risks arising from the proposed activities, the Board concluded that the credit and other risk considerations associated with the proposed clearing-only activities for professional floor traders on the two exchanges are consistent with approval of this notice and that, therefore, the proposed activity is a proper incident to banking within the meaning of section 4(c)(8) of the BHC Act.

3251.0.13.2 Brokerage Services with Respect to Forward Contracts Based on Certain Financial and Nonfinancial Commodities

The notificants also proposed that the section 20 company act as broker with respect to forward contracts based on certain financial and nonfinancial commodities. In this capacity, the company would assist customers in arranging forward contracts with third parties pursuant to which the customers would make (or receive) delivery of financial and nonfinancial commodities on a future date.[31] The section 20 company would act as a broker only with respect to forward contracts that are based on those financial and nonfinancial commodities that also serve as the basis for an exchange-traded futures contract.[32] The Board recognized that banking regulators had not expressly permitted banks to engage in the proposed activity.

Bank holding companies are permitted to act as a broker in the execution and clearance of futures contracts and options on futures contracts based on financial and nonfinancial commodities.[33] As noted above, the forward contracts that the section 20 company proposed to broker would be based on the same financial and nonfinancial commodities that underlie futures contracts that bank holding companies

30. The subcompany's risk-management personnel also electronically receive trade information from the two exchanges up to four times a day. Reports based on such data are prepared by risk-management personnel and reviewed daily.

31. Because the section 20 company will act only as a broker, the section 20 company will not itself be required to take physical delivery of the nonfinancial commodities underlying the forward contracts that it arranges under any circumstances.

32. Exchange-traded futures contracts may be based on a wide variety of commodities, including precious metals, oil, cocoa, or wool.

33. See 1993 FRB 1049.

are permitted to broker as an FCM. Bank holding companies also are permitted to broker forward contracts on foreign exchanges and arrange swap transactions that are based on nonfinancial commodities or indices of nonfinancial commodities.[34] Accordingly, based on these and other facts of record, the Board concluded that acting as a broker for forward contracts based on those financial and nonfinancial commodities that underlie an exchange-traded futures contract is a permissible activity for bank holding companies under section 4(c)(8) of the BHC Act.

34. See 1995 FRB 185.

3251.0.13.3 Conclusion

Based on all the facts of record, the Board approved the notice subject to all the terms and conditions discussed in the order and in the section 20 orders, as modified by the modification orders. (See 1997 FRB 138.)

With the adoption of the April 1997 revision to Regulation Y, the Board authorized certain types of other transactional services in section 225.28(b)(7)(v). Bank holding companies can provide to customers as *agent* transactional services with respect to swaps and similar transactions—

1. any transaction that is described in section 225.28(b)(8) of the regulation;
2. any transaction that is permissible for a state member bank; and
3. any other transaction involving a forward contract, option, futures, option on a futures or similar contract (whether traded on an exchange or not) relating to a commodity that is traded on an exchange.

Under this provision of the current rule, a bank holding company can provide transactional services for customers involving any derivative or foreign-exchange transaction that the bank holding company is permitted to conduct for its own account (item 1 above). A bank holding company may also act as a broker with respect to forward contracts based on a financial or nonfinancial commodity that also serves as the basis for an exchange-traded futures contract. This permits a bank holding company to act as agent in a forward contract that involves the same commodities and assessment of risk that underlie the permissible FCM activities of bank holding companies. This authority is not extended to forward contracts for the delayed sale of commercial products (such as automobiles, consumer products, etc.) or real estate.

Before the incorporation of the above transactions into the authority of Regulation Y, such activities had been previously approved individually by Board order. This section provides, as historical examples, summaries of such activities that were previously approved by Board order. Such orders led to the incorporation of the nonbanking activity into the April 1997 Regulation Y "laundry list." The reader of these examples should only consider the current provisions for "other transactional services" as found in section 225.28(b)(7)(v) of Regulation Y. There should be no reliance on previous Board order commitments, supervisory policies, and interpretations that relate to this nonbanking activity that were in existence before April 21, 1997, unless such provisions remain. Certain former provisions or commitments may no longer be applicable.

3255.0.1 BROKERING OPTIONS ON SECURITIES ISSUED OR GUARANTEED BY THE U.S. GOVERNMENT AND ITS AGENCIES AND OPTIONS ON U.S. AND FOREIGN MONEY-MARKET INSTRUMENTS

A bank holding company applied for the Board's approval under section 4(c)(8) and section 225.21(a) of the Board's Regulation Y to engage de novo, through a wholly owned indirect subsidiary, in certain futures commission merchant and broker-dealer activities. One of the activities proposed for Board approval consisted of engaging in brokerage activities with respect to options on certain physicals, that is, securities issued or guaranteed by the U.S. government and its agencies and U.S. and foreign money-market instruments. The Board concluded that an option on a physical appears to serve the same function as other instruments in that it offers the investor a means to hedge portfolio risk. The Board had previously approved applications to engage in discount securities brokerage for retail customers with respect to corporate securities, and had added discount securities brokerage to the list of permissible nonbanking activities for bank holding companies generally. As a broker for options on physicals, it was stated that the indirect subsidiary would act solely as agent on behalf of nonaffiliated persons for the purchase and sale of options.[1] The services performed by a broker of options on the proposed securities appeared to be similar to those of other brokers. The Board thus concluded on December 8, 1983, that the proposal was closely related to banking (1984 FRB 238).

3255.0.2 BROKERING OPTIONS IN FOREIGN CURRENCY ON EXCHANGES REGULATED BY THE SEC

A BHC applied for the Board's approval under section 4(c)(8) of the BHC Act and section 225.21(a) of the Board's Regulation Y to engage

1. A broker of options on U.S. government and agency securities and options on money market instruments is a securities broker under the securities laws.

de novo, through a wholly owned subsidiary, in executing and clearing options in foreign currency. The Board referenced its approval to a previous order regarding the brokering of options on certain financial physicals (see subsection 3255.0.1 above). The Board concluded that its rationale for this prior action was equally applicable to the brokerage of options in foreign exchange. The Board noted that the applicant had been active in the cash and forward markets for foreign currency and had the expertise to provide the proposed services to customers. The Board concluded on March 19, 1984, that, in the manner proposed, the applicant's proposal to broker options in foreign currency was closely related to banking (1984 FRB 368).

In considering the potential for adverse effects, the Board took into account and relied on the regulatory framework established pursuant to law by the SEC for the trading of options. In addition, the Board noted that the applicant would not trade any of the options involved for its own account.

3255.0.3 EXECUTING AND CLEARING CFTC-REGULATED OPTIONS ON BULLION AND FOREIGN EXCHANGE ON AUTHORIZED COMMODITY EXCHANGES

A BHC applied for the Board's approval under section 4(c)(8) of the BHC Act and section 225.21(a) of the Board's Regulation Y to engage de novo through its wholly owned subsidiary in executing and clearing options. As part of that request, the BHC requested the Board to approve the executing and clearing of CFTC-regulated options on bullion and foreign exchange on authorized commodity exchanges. In making a determination that the activity was closely related to banking, the Board noted—

1. that it previously determined the brokering of futures and options on futures in bullion and foreign exchange to be a permissible nonbanking activity under the former section 225.25(b)(18) of Regulation Y (currently section 225.28(b)(7)(iv));
2. that options on physicals serve essentially the same function as futures and options on futures; and
3. that the brokering of options on certain physicals, that is, U.S. government securities, money market instruments, and options on foreign currency regulated by the SEC, is closely related to banking (1984 FRB 368, see subsection 3255.0.2, above).

The Board determined that the proposed CFTC-regulated options on physicals are functionally and operationally comparable devices for hedging investment-portfolio risk. The Board also determined that the applicant's proposal was substantially similar to proposals to engage in options activities previously approved by the Board. It noted that the applicant had been active in the cash and forward markets for bullion and foreign currency and that it possessed the expertise to provide the proposed services to customers. The Board therefore concluded the activity to be closely related to banking and approved the application on June 5, 1984, in the manner proposed (1984 FRB 591).

Under Regulation Y, a bank holding company may engage in—

1. underwriting and dealing in government obligations and money market instruments (see section 3260.0.1),
2. certain investing and trading activities as principal, and
3. buying and selling bullion and related activities.[1]

A bank holding company may engage or trade as principal in the following:

1. foreign exchange
2. forward contracts, options, futures, options on futures, swaps, and similar contracts, whether traded on exchanges or not, based on any rate, price, financial asset (including gold, silver, platinum, palladium, copper, or any other metal approved by the Board), nonfinancial asset, or group of assets, other than a bank-ineligible security,[2] if—
   a. a state member bank is authorized to invest in the asset underlying the contract;
   b. the contract requires cash settlement;
   c. the contract allows for assignment, termination, or offset prior to delivery or expiration, and the company—
      (1) makes every reasonable effort to avoid taking or making delivery of the asset underlying the contract; or
      (2) receives and instantaneously transfers title to the underlying asset, by operation of contract and without taking or making physical delivery of the asset; or
   d. the contract does not allow for assignment, termination, or offset prior to delivery or expiration and is based on an asset for which futures contracts or options on futures contracts have been approved for trading on a U.S. contract market by the Commodity Futures Trading Commission, and the company—
      (1) makes every reasonable effort to avoid taking or making delivery of the asset underlying the contract; or
      (2) receives and instantaneously transfers title to the underlying asset, by operation of contract and without taking or making physical delivery of the asset
3. forward contracts, options,[3] futures, options on futures, swaps, and similar contracts, whether traded on exchanges or not, based on an index of a rate, a price, or the value of any financial asset, nonfinancial asset, or group of assets, if the contract requires cash settlement

Before the incorporation of these activities involving investment transactions as principal into the authority of Regulation Y, certain of the activities had been approved individually by Board order. Following the Board's adoption of the April 1997 revised Regulation Y, a bank holding company can continue to trade in foreign exchange and bank-eligible securities. Bank holding companies, however, are no longer required to have a separate subsidiary to provide advice to customers when engaging in trading activities as principal.

This section provides, as historical examples, summaries of such activities that were previously approved by Board order. Such orders may have led to the incorporation of the nonbanking activity into the April 1997 Regulation Y "laundry list." The reader of these examples should only consider the current regulatory provisions as currently found in section 225.28(b)(8) of Regulation Y. Only minimum reliance should be placed on previous Board order commitments, supervisory policies, and interpretations that relate to this nonbanking activity that were in existence before April 21, 1997, unless such provisions remain currently. Certain former provisions or commitments may no longer be applicable.

3260.0.1 UNDERWRITING AND DEALING IN GOVERNMENT OBLIGATIONS AND MONEY MARKET INSTRUMENTS

A bank holding company may engage in underwriting and dealing in obligations of the United States, general obligations of states and their

1. A bank holding company is authorized to buy, sell, and store gold, silver, copper, platinum, and palladium bullion, coins, bars, and rounds, and any other metal approved by the Board.
2. See sections 3260.0.4.6 and 3920.0.
3. This does not include acting as a dealer in options based on indexes of bank-ineligible securities when the options are traded on securities exchanges. These options are securities for purposes of the federal securities laws.

political subdivisions, and other obligations that state member banks of the Federal Reserve System may be authorized to underwrite and deal in under 12 U.S.C. 24 and 355. This activity includes banker's acceptances and certificates of deposit, under the same limitations as would be applicable if the activity were performed by the bank holding company's subsidiary member banks or its subsidiary nonmember banks as if they were member banks. See Regulation Y, section 225.28(b)(8)(i) and section 3240.0.

3260.0.2 FOREIGN EXCHANGE

A bank holding company may engage as principal in foreign exchange. See Regulation Y, section 225.28(b)(8)(ii)(A).

3260.0.3 DEALING IN GOLD, SILVER, PLATINUM, AND PALLADIUM BULLION AND COINS

On September 27, 1973, the Board approved a foreign banking organization's request to acquire 30 percent of the voting shares of a domestic company engaged in the trading and arbitrage of gold and silver bullion on various exchanges and in the open market. The subsidiary is enabled to participate in the domestic gold bullion market under 12 U.S.C. 24 (para. 7), which specifically authorized national banks to deal in bullion.

The Board found that buying and selling gold and silver bullion and silver coin, dealing in exchange and silver futures, and arbitraging gold and silver in markets throughout the world are activities closely related to banking or managing or controlling banks. Thus, in approving the application, the Board maintained its basic position that it will benefit the public to allow foreign banks to engage in U.S. activities on a nondiscriminatory basis. (See 1973 FRB 775.)

In another case, a BHC applied for the Board's permission to engage in certain activities related to dealing in gold and silver bullion. The activities consisted of (1) buying and selling gold and silver bullion, bars, rounds, and bullion coins for its own account and the account of others; (2) financing the production, refining, and fabrication of gold and silver, including lending and borrowing gold and silver in connection with such financing; (3) arbitraging gold and silver in markets throughout the world; and (4) providing various incidental services for customers, such as arranging for the safe custody, assaying, and shipment of gold and silver.[4]

The Board determined previously that many of the proposed activities are permissible for BHCs. A BHC may engage in the purchase and sale of gold and silver for its own account and for the account of others.[5] The Board believed the assaying and arranging for transport to be part of this activity.[6] Financing activities for the production and fabrication of gold and silver are permissible activities. (See section 225.28(b)(1) of Regulation Y—Extending credit and servicing loans.) The Board approved the application by order on November 24, 1986 (1987 FRB 61). (See SR-87-7.)

In a subsequent case, a foreign banking organization presented its application to the Board, pursuant to section 4(c)(8) of the BHC Act, requesting permission to engage in the activity, through its wholly owned subsidiary, of purchasing and selling platinum coins issued by the Canadian and Australian governments as legal tender. The subsidiary would acquire the platinum coins issued by the Canadian and Australian governments solely for the purpose of effecting distribution. It would maintain an inventory of the coins. However, it would not purchase the coins for investment or speculation for its own account or offer its customers investment advice regarding their purchase and sale. It would enter into forward contracts with its customers. In considering the BHC's application, the Board noted that the Office of the Comptroller of the Currency had authorized national banks to purchase and sell platinum coins and that the proposed activities were operationally and functionally similar to purchasing and selling gold and silver coins. The Board found the purchasing and selling of platinum coins that function as legal tender to be closely related to banking. The related application was approved on June 25, 1990 (1990 FRB 681).

In a more recent case, a foreign bank subject to the provisions of the BHC Act applied for the

4. The applicant further notified the Board of its intention to purchase and sell for its own account options, futures, and options on futures on gold and silver bullion. The applicant committed to take positions in these investments only as a means of hedging its position in the underlying commodity, that is, gold and silver. The activity was thus permissible under section 4(c)(1)(C) of the BHC Act, which allows BHCs to furnish services to or perform services for such BHCs or its banking subsidiaries.

5. See 1986 FRB 345, 1986 FRB 146, 1985 FRB 467, and 1981 FRB 635.

6. The Board allowed another BHC to provide storage facilities, weighing, coin-counting, and transportation services for bullion and coin. (See 38 *Fed. Reg.* 27,552 (1973).)

Board's permission under section 4(c)(8) of the act and section 225.23 of Regulation Y for its section 20 subsidiary to trade platinum coin and bullion for its own account. The Office of the Comptroller of the Currency has determined that a national bank may engage in this activity. (See OCC Interpretive Letter No. 553, May 2, 1991, relying, in part, on the fact that several countries had recently introduced platinum coins.) The Board had not previously determined that this activity was closely related to banking under section 4(c)(8) of the act. As stated previously, it had determined that the purchase and sale of platinum coins that function as legal tender is an activity that is closely related to banking. (See 1994 FRB 346 and 1990 FRB 681.) The Board had also approved as a nonbanking activity, under Regulation K, trading in platinum by bank holding company subsidiaries located abroad (1994 FRB 177 and 1990 FRB 552). On the basis of these decisions, the Board concluded that the proposed activity is closely related to banking. (See 1995 FRB 190.)

With respect to palladium, a bank holding company applied for the Board's approval under section 4(c)(8) of the act and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) to engage de novo through a wholly owned asset-management subsidiary that will be established to serve as the general partner of limited partnerships (the partnerships) for investing in a wide variety of commodities and exchange-traded and over-the-counter instruments, including trading in precious metals. The partnerships would trade and invest in coin and bullion consisting of such precious metals as palladium, platinum, gold, and silver.

The Board has previously determined that it is closely related to banking under the act for bank holding companies to trade in all the instruments and commodities it proposed for the partnerships, except palladium.[7] Banks currently are permitted to engage in palladium trading.[8] Therefore, the Board concluded that trading palladium coin and bullion is closely related to banking within the meaning of section 4(c)(8) of the act.

7. See 12 C.F.R. 225.28(b)(6)(iv), 1987 FRB 61 (trading gold and silver bullion and coin), and 1995 FRB 190 (trading platinum coin and bullion for a BHC's own account).

8. See OCC Interpretive Letters Nos. 683 (1995) and 553 (1991).

3260.0.4 ENGAGING AS PRINCIPAL IN DERIVATIVES INVOLVING FINANCIAL ASSETS AND NONFINANCIAL ASSETS OR GROUPS OF ASSETS

A bank holding company may engage as principal in forward contracts, options, futures, options on futures, swaps, and similar contracts, whether traded on exchanges or not, based on any rate, price, financial asset, nonfinancial asset, or group of assets, other than a bank-ineligible security. A financial asset includes gold, silver, platinum, palladium, copper, and any other metal approved by the Board. See Regulation Y, section 225.28(b)(8)(ii)(B).

3260.0.4.1 Trading for a Company's Own Account in Futures, Options, and Options on Futures Based on U.S. Government Securities and Certain Money Market Instruments

A foreign bank, subject to the provisions of the BHC Act, applied to the Board under section 4(c)(8) and section 225.23 of the Board's Regulation Y to engage through a wholly owned subsidiary in trading activities for its own account. The trading included futures, options, and options on futures based on U.S. government securities that are permissible investments for national banks (bank-eligible securities) and certain money market instruments.[9]

The Board had previously determined that BHCs could purchase derivative instruments based on government securities for the purpose of reducing interest-rate exposure. (See 12 C.F.R. 225.142, Statement of Policy Concerning Bank Holding Companies Engaging in Futures, Forward, and Option Contracts on U.S. Government and Agency Securities and Money Market Instruments.) Previously, the Board approved applications to trade in derivative instruments based on foreign exchange for the company's own account for other than hedging purposes. (See 1989 FRB 217.) Section 225.28(b)(7)(iv) and 225.28(b)(6)(iv) of Regulation Y detail a BHC's ability to act as futures commission merchant and to offer advice with regard to futures

9. See 1991 FRB 759 for a listing of the derivative instruments to be traded, which are listed in appendix A. The subsidiary would hedge its positions in these instruments with the instruments listed in appendix B of the order.

and options on futures on bank-eligible securities, respectively.

The purchasing and selling of derivative instruments that represent the right to purchase and sell bank-eligible securities is considered by the Board to be closely related to banking.[10] The experience gained by banks in dealing with the securities underlying these instruments would equip the banks to trade in instruments based on these securities. In addition, the derivative instruments based on money market instruments require a market judgment on interest rates. Banks have developed an expertise in such judgments through their lending and funding activities. The Board thus concluded on July 12, 1991, the activity of trading for a company's own account in derivative instruments based on bank-eligible securities and certain money market instruments to be closely related to banking. (See 1991 FRB 759).

3260.0.4.2 Dealing as a Registered Options Trader on Foreign-Exchange Options

A foreign bank subject to the BHC Act applied under section 4(c)(8) of the act to deal, through its wholly owned U.S. subsidiary, as a registered options trader (trader) on foreign-exchange options. As a trader, the subsidiary would act as dealer and market maker in such options to assist in the maintenance of a ''fair and orderly'' market on the designated exchange. A trader deals for its own account in order to maintain a ''fair and orderly'' market in certain options when a lack of price continuity or temporary disparity exists on options for which the trader makes a market. The subsidiary would be obliged to make a market in the proposed foreign-currency options, or bid and offer, for all traders who approach it on the designated exchange. The subsidiary would not be obliged in any way as to the price and quantity it bids and offers. A trader is permitted to ''leave the floor,'' that is, not trade, if it meets minimum trading levels each quarter.

The Board previously recognized that foreign-exchange activities have traditionally been conducted at banks and are permissible activities under the BHC Act.[11] The Board noted that the Office of the Comptroller of the Currency authorized national banks to deal in foreign-currency options as a trader on a securities exchange. It also noted that through bank participation in the interbank market for foreign-currency options, banks developed experience in dealing, market making, and risk management, which are deemed essential elements of the activities proposed. For these reasons and the facts presented in the BHC's application, the Board approved the nonbanking activity as being closely related to banking. The application was approved by the Board on July 30, 1990 (1990 FRB 776).

3260.0.4.3 Acting as a Specialist in Options on Foreign Exchange

A foreign bank subject to the BHC Act applied for the Board's approval under section 4(c)(8) of the act (12 U.S.C. 1843(c)(8)) and section 225.21(a) of the Board's Regulation Y (12 C.F.R. 225.21(a)) for its wholly owned subsidiary (the company) to act as the sole specialist in deutsche mark options on a specified exchange (the exchange). As a specialist, the subsidiary would act as a dealer and market maker in these options for the purpose of assisting in the maintenance of a fair and orderly market on the exchange.

The Board found the activity of engaging as a specialist in foreign-currency options on the exchange to be closely related to banking for purposes of section 4(c)(8) of the BHC Act. Banks provide services that are operationally similar to the activities proposed. The Board deemed banking organizations to be particularly well equipped to provide the proposed activities. The Board believes that banks possess substantial experience in dealing in foreign exchange and related services that are similar to the functions involved in the BHC's proposed specialist activity. Foreign-exchange activities were noted as having been traditionally conducted by banks that are major participants in all aspects of the foreign-exchange markets. Banks act as market makers in various currencies. Banks trade for their own account as well as for their customers in virtually all foreign-exchange markets and instruments, including trading in foreign-currency options on regulated exchanges, as proposed by this BHC applicant.

The Board believes the financial risk in this case to be sufficiently minimized since (1) the rules of the exchange allow the specialist to set

10. The applicant was not authorized to purchase derivative instruments based on securities or instruments that a state member bank may not purchase for its own account.

11. See 1989 FRB 217, 308, and 580.

the price and quantity that it will buy and sell in order to limit its risk in an adverse or volatile market; (2) the specialist is prohibited from speculating; and (3) the BHC has committed not to write unhedged options, having developed substantial experience with hedging from its existing foreign-currency and options business. The company will be a registered broker-dealer with the Securities and Exchange Commission (SEC) and will thus be subject to the SEC's net capital rule. The Board expects that the company will maintain capital adequate to support its activity and to cover reasonable expenses and losses at all times.

The Board considered its earlier decision (1986 FRB 141) to deny a proposal to act as a specialist in French franc options on the exchange, summarized in section 3700.8. The Board believes that the facts and circumstances in this case were different in several significant respects from the current situation. The current proposal did not raise the issues relating to potential conflicts of interest and risk raised by the earlier decision (1986 FRB 141). The markets for deutsche marks and deutsche mark options are more liquid than they were for French francs at that time. Further, the market for foreign-currency options has broadened significantly on the exchange, and the involvement of commercial banks in that market has become more widespread. The Board approved the BHC's application by order on June 22, 1989. (See 1989 FRB 580.)

3260.0.4.4 Acting as a Dealer, Broker with Respect to Interest-Rate and Currency Swaps and Related Transactions

A bank holding company applied pursuant to section 4(c)(8) of the BHC Act and section 225.23(a) of the Board's Regulation Y for its wholly owned subsidiary to engage de novo in—

1. intermediating in the international swap markets by acting as originator and principal in interest-rate swap and currency-swap transactions;
2. acting as an originator and principal with respect to certain risk-management products such as caps, floors, and collars, as well as options on swaps, caps, floors, and collars (swap-derivative products);
3. acting as a broker or agent with respect to the foregoing transactions and instruments; and
4. acting as an adviser to institutional customers regarding financial strategies involving interest-rate and currency swaps and swap-derivative products.

The Board has permitted bank holding companies under section 4(c)(8) of the act to provide advice in connection with interest-rate and currency swaps, interest-rate caps, and similar transactions.[12] (See 1987 FRB 59 and 1989 FRB 308.) However, the Board had not previously approved the remaining activities proposed under section 4(c)(8) of the act. The Board determined that the remaining activities proposed are closely related to banking for the reasons summarized below.

Intermediating in the International Swap Market; Acting as an Originator and Principal with Respect to Certain Risk-Management Products—Caps, Floors, Collars, and Options on Swaps, Caps, Floors, and Collars

1. Banks, in particular, the money center banks, do conduct the proposed intermediation

---

12. Swap terminology:

Interest-rate swap. An exchange between two counterparties of different payment streams arising out of fixed-rate and floating-rate payment obligations. The exchange is made using the same currency and is calculated by reference to a mutually agreed-upon ‘‘notional'' principal amount.

Currency swap. An exchange between two counterparties of a fixed-rate interest obligation in one currency for a fixed-rate interest obligation in another currency. Currency swaps may involve an initial physical exchange of principal at an agreed-upon current exchange rate or an exchange of interest payments in different currencies on an agreed-upon notional amount with no actual transfer of principal. In either case, there will be periodic exchange of fixed-rate interest payments over the course of the swap. Upon maturity, there would be a re-exchange of the original principal amounts.

Cap. An agreement under which one party purchases from the other a promise to pay, at predetermined future times, the excess, if any, of a specified floating interest rate over a fixed per annum rate. Caps may be sold separately or packaged with an interest-rate swap.

Floor. An agreement under which one party purchases a promise by another to pay the amount, if any, by which a specified floating interest rate is lower than a fixed per annum rate at specified times during the life of the agreement. Floors may be sold separately or packaged with an interest-rate swap.

Collar. The simultaneous sale of a cap and purchase of a floor, or purchase of a cap and sale of a floor.

Agent or broker in swap market. An agent or broker in the swap market locates, for a fee, a suitable counterparty for a party seeking to enter into a swap agreement.

Intermediary in swap market. A party that is willing to step between the two parties of a swap agreement and act as a principal counterparty with each of the other participants, thus taking on the credit risk of each of the participants. Upon entering into a swap with one counterparty, the intermediary enters into an equivalent and offsetting swap with another counterparty.

activities within the international swap market.

2. Banks have participated in the swap markets for several years as end-users, entering into swaps and purchasing swap-derivative products in order to hedge other business risks or to match assets and liabilities.

Acting as a Broker or Agent with Respect to These Transactions and Instruments

1. Banks provide services that are operationally similar to the proposed activities.
2. The Board had previously determined that acting as a broker with respect to foreign-exchange forward transactions is closely related to banking since banks have historically engaged in the provision of assistance with respect to foreign exchange. (See 1983 FRB 221.) Currency swaps are very similar to foreign-exchange forward transactions. The primary difference is the exchange of interest rates in connection with currency swaps. Interest-rate swaps are similar to currency swaps in that they involve agreements to exchange different payment streams that arise out of a prescribed principal amount. Similarly, caps, floors, and collars involve agreements to pay an amount by reference to a prescribed interest rate.

The Board approved the application on June 26, 1989 (see 1989 FRB 582), subject to the commitments included in the order to minimize the potential risk (that is, credit, price, basis, portfolio, and operations risk) and the possible conflicts of interest.

3260.0.4.5 Currency Swaps for Hedging a BHC's Own Position in Foreign Currency

A foreign bank, subject to section 4 of the BHC Act, applied for the Board's permission to acquire, through its wholly owned subsidiary, all the shares of a company located in New York, New York. The acquired company would engage in several nonbanking activities. One of the activities, not previously approved by the Board for BHCs, consisted of entering into currency-swap transactions for hedging the BHC's own position in foreign currency. The Board previously found that banks engage in this activity and thus concluded that the activity is closely related to banking.[13] In conducting this activity, the applicant is to use the same policies, quantitative limitations, and internal controls and audit programs applicable to its trading in futures, options, and options on futures and similar contracts used for hedging, including the guidelines in the Board's policy statement.[14] The application was approved on August 15, 1990 (1990 FRB 860).

3260.0.4.6 Derivative Transactions as Principal (Commodities Underlying Derivative Contracts)

On June 27, 2003, the Board amended section 225.28 of Regulation Y (12 C.F.R. 225.28(b)(8)(ii)(B)), effective August 4, 2003, to permit bank holding companies (BHCs) to enter into commodity derivative contracts (commodity contracts) that are settled by the BHC receiving and transferring title to the underlying commodity instantaneously, by operation of contract, without taking physical possession of the commodity. The Board also modified the existing condition in Regulation Y that generally prevented BHCs from engaging as principal in a physically settled commodity contract unless the contract specifically provides for assignment, termination, or offset before delivery (the contractual offset requirement).

The restrictions in Regulation Y that were effective before August 4, 2003, were designed to reduce the potential that BHCs would become involved in and bear the risks of physical possession, transport, storage, delivery, and sale of bank-ineligible commodities. These restrictions ensured that the commodity derivatives business of a BHC was largely limited to acting as a financial intermediary that facilitates transactions for customers who use or produce commodities or are otherwise exposed to commodity-price risk as part of their regular business.

The former Regulation Y derivatives restrictions, however, impeded the ability of BHCs to participate substantially in certain derivatives markets. Notably, in some over-the-counter (OTC) forward markets (U.S. energy markets, for example), the physically settled derivative contracts traded by market participants do not specifically provide for assignment, termination, or offset prior to delivery and, thus, did not conform to the contractual offset requirement of

13. See 1989 FRB 582.

14. Statement of Policy Concerning Bank Holding Companies Engaging in Futures, Forward and Options Contracts on U.S. Government and Agency Securities and Money Market Instruments. See 12 C.F.R. 225.142 (establishing guidelines for trading in forward, futures, and option contracts on financial instruments).

Regulation Y. Moreover, participants in these markets generally settle contracts by temporarily taking and making delivery of title to the underlying commodities and, thus, did not comply with the requirement in Regulation Y that the BHC make every reasonable effort to avoid taking or making delivery of the asset underlying the contract (the delivery avoidance requirement).

Financial intermediary participants in these markets generally enter into back-to-back derivative contracts with third parties that effectively offset each other. That is, financial intermediaries in these markets that enter into a contract to buy, for example, a certain number of barrels of oil from a certain counterparty in a certain future month generally also will enter into another contract, before the expiration of the original contract, to sell the same number of barrels of oil to another counterparty in the same future month on substantially identical delivery terms. These market practices typically result in the creation of a chain of contractual relationships that begins with a commodity producer, passes through a number of intermediaries who have entered into matched contracts both to buy and sell the same commodity at the same future time, and ends with a purchaser that intends to take physical delivery of the commodity. On the maturity date of the derivative contracts, the producer will be responsible for making physical delivery, and the ultimate buyer will be responsible for accepting physical delivery, while each intermediate participant in the chain will be deemed, by operation of contract, to have instantaneously received and transferred legal title to the commodity.

The Board believes that a BHC that takes title to a commodity on an instantaneous, pass-through basis takes no risk that is greater than or different in kind from the risk that the BHC has as a holder of a commodity derivative contract that met the former requirements of Regulation Y. Instantaneous receipt and transfer of title to (but not physical possession of) commodities does not appear to involve the usual activities relating to, or risks attendant on, commodity ownership. Instead, such transactions involve the routine operations functions of passing notices, documents, and payments—functions that BHCs regularly perform in their role as financial intermediaries in other markets. Moreover, although BHCs that receive and transfer title to commodities on an instantaneous, pass-through basis face default risks, they are not significantly different than the default risks associated with cash-settled derivative contracts or derivative contracts that include the assignment, termination, or offset provisions previously required by Regulation Y. In addition, banking organizations that engage in derivatives activities, including the modified Regulation Y commodity derivatives activities, will remain subject to the general securities, commodities, and energy laws and the rules and regulations of the Securities and Exchange Commission, the Commodity Futures Trading Commission (CFTC), and the Federal Energy Regulatory Commission.

For the above reasons, the Board modified Regulation Y by changing the delivery avoidance requirement to allow BHCs to take or make delivery of title to commodities underlying commodity derivative transactions on an instantaneous, pass-through basis. A BHC takes and makes delivery of title to a commodity on an instantaneous, pass-through basis for purposes of Regulation Y only if the BHC takes delivery of title to the commodity from a seller and immediately thereafter makes delivery of title to the commodity to a buyer. Accordingly, the revised delivery avoidance requirement does not provide authority for a BHC to take physical delivery of commodities for use or investment or to make physical delivery of commodities out of the inventory of the BHC. In other words, the BHC must not be the original seller of the commodity in the initial position in the delivery chain or the ultimate buyer of the commodity in the last position in the delivery chain.

The Board's modification of Regulation Y also changed the contractual offset requirement to permit BHCs to participate in physically settled derivative markets in which the standard industry documentation does not allow for assignment, termination, or offset. In particular, the modified Regulation Y allows BHCs to enter into commodity contracts that do not require cash settlement or specifically provide for assignment, termination, or offset before delivery so long as the contracts involve commodities for which futures contracts have been approved for trading on a U.S. futures exchange by the CFTC (and the BHC complies with the revised delivery avoidance requirement).[15]

15. The CFTC publishes annually a list of the CFTC-approved commodity contracts. See, for example, Commodity Futures Trading Commission, *FY 2001 Annual Report to Congress* 126. With respect to granularity, the Board intends this requirement to include all types of a listed commodity. For example, any type of coal or coal derivative contract would satisfy this requirement, even though the CFTC list specifically approves only Central Appalachian coal.

The Board's modifications of the derivatives provisions in Regulation Y are effective for all BHCs. (See 2003 FRB 385.)

3260.0.5 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws*[1]	*Regulations*[2]	*Interpretations*[3]	*Orders*
Investment transactions as principal		225.25(b)(8)		
Investing and trading activities—engaging as principal	1843(c)(8)—section 4(c)(8) of the BHC Act	225.28(b)(8)(ii)		
BHCs can (1) take and make delivery of title to commodities underlying commodity derivatives contracts on an instantaneous, pass-through basis and (2) enter certain commodity derivative contracts that do not require cash settlement or specifically provide for assignment, termination, or offset prior to delivery		225.28(b)(8)(ii)(B)		2003 FRB 385

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

Effective December 31, 1980, the Board amended section 225.28(b) of Regulation Y (12 C.F.R. 225.28(b)(2)(i)) to include the performance of real estate appraisals in the list of activities permissible for bank holding companies to engage in. The Board concluded that banks perform real estate appraisals either in connection with extensions of credit involving real estate lending or as a discrete activity. In addition, such an appraisal activity calls upon the necessary skills and resources often possessed by banking organizations. The Board thus determined that the activity of performing appraisals of real estate is closely related to banking and that its performance by bank holding companies will yield net benefits to the public.

In addition to authorizing the appraisals of real estate as a nonbanking activity, the Board has previously determined by order that the appraisal of certain types of personal property, both tangible and intangible, is closely related to banking (1985 FRB 118). Providing personal property appraisals was added to the list of permissible nonbanking activities in Regulation Y. It was combined with the already-approved activity of providing real estate appraisals (12 C.F.R. 225.28(b)(2)(i)). The action was approved by the Board on October 31, 1986, effective December 15, 1986, without any conditions. In permitting bank holding companies to engage in the activity of providing valuations of companies, the Board noted that the commercial lending and trust departments of banks commonly make valuations of a broad range of tangible and intangible property, including the securities of closely held companies. Providing valuations of companies necessarily involves the appraisal of various types of intangible personal property, such as securities of closely held corporations, as well as any tangible personal property that a company might possess.

Banks currently engage in the appraisal of personal property through their trust departments. Trust departments value private business interests for their own trust accounts and other types of personal property in a customer's estate for probate and tax purposes. Banks engage in property appraisal activities in connection with secured lending activities and routinely appraise property which they take as collateral on loans, including perishable commodities, durable goods, computer software, crops, livestock, machinery, and equipment.

Banks also engage in appraisal activities in connection with their leasing activities. With regard to leasing, banks determine the residual value of leased property, such as vehicles and equipment, in order to establish the terms of a lease. Some money-center banks have appraised aircraft and locomotives, in connection with their leasing or lending transactions. Finally, banks may become involved in personal property appraising when they appraise real property, since certain types of real property, such as factories or apartment buildings, contain fixtures or other personal property that must be evaluated separately to determine the value of the real property.

3270.0.1 SCOPE OF INSPECTION

As noted within the subsequent inspection procedures, a sampling of real estate and personal property appraisals is to be reviewed to determine whether the appraised value of the property is reasonable and the documentation supports the appraisal.

Regulatory appraisal standards for federally related transactions are discussed below and must be considered in determining the scope of the inspection. The types, components, and procedures that should be used in evaluating real estate appraisals are included in section 2231.0, which contains guidelines for use by bank holding companies and subsidiaries for real estate appraisal and evaluation programs. Personal property appraisal involves estimating or determining the value of property other than real property.

3270.0.2 APPRAISAL STANDARDS FOR FEDERALLY RELATED TRANSACTIONS

The Board approved, on June 27, 1990, Appraisal Standards for Federally Related Transactions[1] that represent amendments to Regulation H (12 C.F.R. 208) and Regulation Y (12 C.F.R. 225) that are designed to protect federal financial and public policy interests in real estate transactions requiring the services of an appraiser. The regulations are intended to supplement the Board's appraisal guidelines currently in effect. Section

1. "Federally related transaction" refers to any real estate–related financial transaction entered into on or after August 9, 1990, that (1) the Board or any regulated institution engages in or contracts for and (2) requires the services of an independent appraiser.

208.50 of Regulation H refers to the appraisal standards for federally related transactions entered into by state member banks. The appraisal standards for federally related transactions are found in subpart G, section 225 of Regulation Y. The amendments were the result of implementing provisions of title XI of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (FIRREA) regarding real estate appraisals. The Regulation Y amendments identify which transactions require an appraiser (section 225.63),[2] set forth minimum standards for performing appraisals (section 225.64), and distinguish those appraisals requiring the services of a state-certified appraiser from those requiring a state-licensed appraiser (section 225.63). The effective dates are August 9, 1990, for the appraisal standards and July 1, 1991, for the appraiser certification and licensing requirements. Other provisions address appraiser independence (section 225.65), professional association membership, and competency.

3270.0.3 APPRAISER'S QUALIFICATIONS

With respect to an institution's selection of appraisers, examiners need to consider the following:

1. The professional certification, license, or other recognition of the competence of the appraiser. For real estate appraisals, the appraiser must have the proper state certification or license required by section 225.63 of Regulation Y. Examiners should also consider the September 1992 Guidelines for Real Estate Appraisal and Evaluation Programs. For personal property appraisals, the appraiser's qualifications might be evidenced by certification from a nationally recognized personal property appraisal organization or they may be supported by license or other recognition of the competence of the appraiser.
2. The reputation and standing of the specialist in the view of his peers and others familiar with the person's capability of performance.
3. The relationship, if any, of the appraiser to the bank holding company in order to determine independence and objectivity.
4. The appraiser's documented accomplishments (for example, the appraiser's personal "qualifications statement" or job history resume).
5. Whether the appraiser's experience and knowledge or expertise relates to the property appraised.
6. Whether the appraiser meets continuing-education requirements for licensing or certification. Membership or the absence of membership in any particular appraisal organization should not be accepted as prima facie evidence of an appraiser's qualifications.

2. The Appraisal Standards for Federally Related Transactions that are found in Regulation Y were amended, effective December 28, 1998, to exclude from the Board's appraisal requirements transactions involving the underwriting of or dealing in mortgage-backed securities. The amendment permits bank holding company subsidiaries engaged in the underwriting of and dealing in securities to underwrite and deal in mortgage-backed securities without demonstrating that the loans underlying the securities are supported by appraisals that meet the Board' s appraisal requirements.

3270.0.4 KEY COMPONENTS OF A PERSONAL PROPERTY APPRAISAL REPORT

When reviewing personal property appraisals, the appraisal should describe the following:

1. the kind of value being determined, such as fair market value, liquidation value, replacement/reproduction value, etc.
2. the property being valued
3. the detailed procedures used to estimate the values, such as—
   a. analysis of comparable sales,
   b. estimation and analysis of income, and
   c. the appraised values as of a specific date
4. the name of the individual who made the appraisal and who is responsible for its validity and objectivity (to the person receiving the appraisal, to third parties, and to the public)
5. the personal qualifications data of the appraiser

3270.0.5 APPRAISAL OF CONSTRUCTION AND CONSTRUCTION-ANALYSIS SERVICES

The activity of providing construction-analysis services, including appraisal of construction projects at various stages of development and disbursement of construction loan funds in accordance with the terms of the loan agreement, is included within the permissible activities of real estate appraising and loan servicing.

3270.0.6 INSPECTION OBJECTIVES

1. To determine what financial effect the activity has on the parent holding company and the bank subsidiaries.
2. To determine whether the company has formal written policies and procedures. For real estate appraisals, the policies and procedures should be consistent with the Guidelines for Real Estate Appraisal and evaluation programs in section 2231.0.
3. To determine if there is compliance with the appraisal standards for federally related transactions detailed in the Board's Regulations H and Y.
4. To determine whether the appraisals were performed on an independent basis.
5. To determine whether the individuals performing the appraisals are qualified and that the appraisals are reasonable.
6. To determine whether the appraisals are current, complete, and reasonably accurate.
7. To determine if real estate appraisals are performed by state-licensed or state-certified appraisers.

3270.0.7 INSPECTION PROCEDURES

1. Review the company's financial statements and determine if there are any factors or trends that could have an adverse impact on the parent holding company or the bank subsidiaries.
2. Review the company's policies and procedures to determine that the following are present:
   a. Adequate minutes are prepared of the board and board committee meetings.
   b. Professional liability insurance and blanket bond coverage, if appropriate, are in place and the coverage appears sufficient.
   c. Only qualified individuals are authorized to perform appraisals.
3. Review a sampling of the real estate and personal property appraisals to determine how a value is derived and whether this value is adequately substantiated.
4. For the appraisals reviewed in procedure 3, determine the reason for each appraisal. If it is for the purpose of valuing collateral for a loan extended by or to a bank affiliate, does the value appear realistic in relation to the loan amount?
5. Check for compliance with section 106(b) of the 1970 Amendments of the BHC Act (prohibition against tie-in arrangements). (See section 3500.0.)

3270.0.8 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Real estate appraisal activity approval		225.28(b)(2)(i)		1980 FRB 962 and 984 1997 FRB 275
Acquisition of a nonbanking subsidiary that performs valuations of companies and of large blocks of stock for a variety of purposes				1985 FRB 118
Personal property appraisal activity approval		225.28(b)(2)(i)		1986 FRB 833 1997 FRB 275
Appraisal standards for federally related transactions		225 subpart G, 225.61–225.67	4–053	1990 FRB 639 1999 FRB 50

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

The activities of check-guaranty and check-verification services permit bank holding companies to authorize the acceptance by subscribing merchants of certain personal checks tendered by the merchant's customers in exchange for goods and services, and to purchase validly authorized checks from merchants in the event the checks are subsequently dishonored.

The Board determined, previously, that check-guaranty services were closely related to banking, and had approved applications by bank holding companies on a case-by-case basis to engage in the activity (1979 FRB 263 and 1981 FRB 740). See also 1999 FRB 582, 1996 FRB 348 (fraud-detection services), 1994 FRB 1107, and 1995 FRB 492 (ATM network services).

The Board noted the potential for unfair competition or conflicts of interest with respect to the authorization of checks not drawn on affiliated banks. To minimize this possibility, the Board has maintained a condition in Regulation Y, noted in previous orders, stating that the check guarantor cannot discriminate against checks drawn on unaffiliated banks.

3320.0.1 INSPECTION OBJECTIVES

1. To determine the extent of exposure to guaranteed bad-check losses.
2. To determine whether management is qualified and effective in controlling losses.
3. To determine whether administrative and operating procedures and check-guaranty and check-verification transactions are processed in accordance with established Board or Board committee authorization policies and procedures, including adequate internal control procedures.
4. To determine whether recordkeeping and data processing are adequate and current to avoid losses resulting from outdated or inaccurate information.
5. To determine whether any significant contingent liabilities exist.
6. To determine whether the financial condition of the nonbanking subsidiary will have an adverse influence on the financial condition of the consolidated corporation.

3320.0.2 INSPECTION PROCEDURES

1. Review financial statements to determine the financial condition of the company and past and current operating trends. Test the accuracy of those records against the financial statements for each material asset, liability, and equity account.
2. Review the minutes of the board of directors and executive committees and correspondence exchanged with the company's legal counsel.
3. Review authorization records for check-guaranty and check-verification services for adequacy to determine whether check clearance is verified and whether the company has an accurate record of its contingent liability for guaranteed checks.
4. Review collection records to determine whether follow-up procedures on purchased guaranteed bad checks are adequate and whether they evidence timely collection contacts and successful recoveries.
5. Determine whether collection-problem checks are turned over to attorneys or collection agencies for appropriate collective or legal action on a timely basis.
6. Review the company's history of bad-check losses and the current status of uncollected bad checks, and determine whether adequate reserves have been set aside for those losses.
7. Determine whether fee calculations and billing procedures ensure accuracy and propriety.

3320.0.3 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Engage de novo through a new nonbank subsidiary in the activity of check verification				1979 FRB 263
Retail check-authorization and check-guaranty activities				1981 FRB 740 1999 FRB 582
Fraud-detection services				1996 FRB 348 (see footnote 15)
Amendment of Regulation Y adding check verification as a permissible activity		225.28(b)(2)(iii)		1986 FRB 833 1997 FRB 275

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

The Board authorized the addition of operating a collection agency to the list of approved activities. A collection-agency subsidiary seeks to collect payment on the overdue bills of debtors, charging the party submitting the claim a flat dollar amount or a specified percentage commission contingent on the amount collected. The Board determined that operating a collection agency is closely related to banking as banks engage in debt-collection activities for loans they originate and service, including overdue credit-card accounts.

The Board recognized the potential for unfair competition and conflicts of interest through the operation of a collection agency. Accordingly, the Board established the following conditions on operating a collection agency:

1. The collection agency shall not obtain the names of customers of competing collection agencies from an affiliated depository institution that maintains trust accounts for those agencies
2. The collection agency shall not provide preferential treatment to an affiliate or a customer of such affiliate seeking collection of an outstanding debt.

3330.0.1 INSPECTION OBJECTIVES

1. To determine whether the collection agency is obtaining the names of customers of competing collection agencies from an affiliated depository institution that maintains trust accounts for those agencies.
2. To determine whether the collection agency provides preferential treatment to an affiliate or a customer of such affiliate seeking collection of an outstanding debt.
3. To determine what effect the activity has on the parent company, its subsidiaries, and the overall consolidated organization, and whether the company or activity evidences a going concern.
4. To determine whether the company has formal written policies and operating and internal control procedures to successfully administer the activity.
5. To determine the extent of management expertise, experience, and involvement with the administration of the activity.
6. To determine the extent of compliance with laws, regulations, and interpretations associated with the activity, including the Fair Credit Reporting Act, Fair Debt Collection Practices Act, and Right to Financial Privacy Act.
7. To determine whether the company administers formal training programs which include proper operating and compliance methods.
8. To determine whether any significant contingent liabilities exist and whether those liabilities resulted from the failure of the bank holding company or its nonbanking subsidiary to fulfill its responsibilities as an agent for its customers.

3330.0.2 INSPECTION PROCEDURES

1. Review financial statements to determine the financial condition of the company and past and current operating trends. Test the accuracy of the financial statements against the company's financial records and other supportive corroborating evidence.
2. Review the minutes of the board of directors and executive committees, and correspondence exchanged with the company's legal counsel with regard to possible contingency losses.
3. Review collection records for adequacy, and determine whether the amount of payments received is independently verified.
4. Review collection records—tickler files—to determine whether follow-up procedures on acquired accounts are adequate and whether they evidence timely collection contacts and successful recovery rates.
5. Determine whether appropriate legal action is used and authorized by customers on a timely basis.
6. Determine whether fee calculations and billing procedures ensure accuracy and propriety.
7. Review parent company and subsidiary administrative and operating policies, and determine whether the collection agency is prohibited from obtaining the names of customers of competing collection agencies from an affiliated depository institution that maintains trust accounts for those agencies.
8. Review customer lists and billings and any prioritized collection schedules, and determine whether the collection agency is providing any preferential treatment to an affiliate or a customer of such affiliate seeking collection of an outstanding debt.

Section 4(c)(8) of the BHC Act (Operating a Credit Bureau) — Section 3340.0

A bank holding company that engages in the activity of operating a credit bureau gathers, stores, and disseminates factual information relating to the identity and paying habits of consumers. Credit bureaus then provide this information for a fee to credit grantors, such as retailers, banks, and finance companies, to enable the institutions to arrive at prudent credit-granting decisions. The Board concluded that the activity is closely related to banking as banks maintain credit files and analyze credit information as part of their consumer-lending function.

The Board recognized that possible adverse effects could result from a potential conflict of interest when a bank holding company performs credit bureau activities. For example, under the Fair Credit Reporting Act, a credit bureau is required to investigate the accuracy of any item of information disputed by a consumer (15 U.S.C. 1681(i)). A bank holding company credit bureau may not conduct an impartial investigation if the disputed information originates with an affiliate. The Board thus imposed the condition that a credit bureau could not provide preferential treatment to a customer of an affiliated financial institution.

Regulation Y allows bank holding companies to engage only in consumer-credit-reporting activities rather than credit-reporting activities concerning large commercial institutions.

3340.0.1 Inspection Objectives

1. To determine whether the activity is limited to only consumer-credit-reporting activities.
2. To determine whether the bank holding company gives preferential treatment to a customer of an affiliated financial institution.
3. To determine the adequacy of internal policies and operating and internal control procedures.
4. To determine whether any significant contingent liabilities exist which arose from the failure of the holding company and its nonbanking subsidiary to fulfill their responsibilities as an agent for their customers.
5. To determine whether appropriate steps have been taken to ensure compliance with the Fair Credit Reporting Act, Equal Credit Opportunity Act, and Right to Financial Privacy Act.
6. To determine whether adequate controls exist to prevent unauthorized access into any computerized credit bureau credit files to preserve the confidentiality of the information stored for customers' use.

3340.0.2 INSPECTION PROCEDURES

1. Review the company's financial statements for accuracy, and determine if there are any factors or trends that could have an adverse impact on the parent company or its banking or nonbanking subsidiaries.
2. Review recordkeeping practices, and determine whether such management information systems are adequate to service customers and limit the risk of loss resulting from weak recordkeeping activities.
3. Review customer logs or client lists, and determine whether the activity is limited to only consumer-credit-reporting activities.
4. Review the activity and billings for a customer of an affiliated financial institution, and compare those findings to the activities and billings of other customers. Determine whether the bank holding company is giving preferential treatment to a customer(s) of an affiliated financial institution.
5. Review the company's policies and operating and internal control procedures for the activity, and determine whether they have been documented and whether they are being tested for compliance as part of the company's internal/external audits.
6. Review correspondence with legal counsel, and determine whether any significant contingent liabilities exist due to the failure of the holding company and its nonbanking subsidiary to fulfill their responsibilities as an agent for their customers.
7. Determine whether internal control procedures and compliance audits test for compliance with the Fair Credit Reporting Act, Equal Credit Opportunity Act, and Right to Financial Privacy Act.
8. Determine what steps have been taken to prevent unauthorized access to any computerized credit bureau credit files to preserve the confidentiality of the information stored for customers' use.

3. Federal Reserve Regulatory Service reference.

Section 106(b) of the Bank Holding Company Act Amendments of 1970 (12 U.S.C. 1972(b)) generally prohibits a bank from tying a product or service to another product or service offered by the bank or any of its affiliates. A prohibited tie-in can occur if a bank (1) varies the consideration for a product or service (the ‘‘tied product’’) from the bank or any of its affiliates, or (2) requires the customer to purchase another product or service from the bank or any of its affiliates as a condition for providing a product or service to a customer.

The intent behind section 106(b) is to affirm the principles of fair competition by eliminating the use of tie-in arrangements that suppress competition. Section 106(b) is intended to prevent banks from using their market power over certain products (specifically credit) to gain an unfair competitive advantage in other products. The restrictions of section 106(b) on banks are broader than those of the antitrust laws, as no proof of economic power in the tying-product market or anticompetitive effects in the tied-product market are required for a violation to occur. Although banks, like their nonbank competitors, were already subject to general antitrust prohibitions on tying, section 106 was enacted because Congress concluded that special restrictions were necessary given the unique role of banks in the economy.

Although the 1970 legislation amended the Bank Holding Company Act, it is applicable to all commercial banks, whether or not they are subsidiaries of holding companies. The term ‘‘company’’ is not used in section 106(b) but in another part of the 1970 legislation. Therefore, it is not relevant to section 106.

3500.0.1 ANTI-TYING RESTRICTIONS AND OTHER PROVISIONS

Section 106 of the BHC Act Amendments has five restrictions that are applicable to banks. These restrictions apply only when the products are separately available for purchase. The first two restrictions prohibit conditions constituting traditional tie-in arrangements; restrictions three and four prohibit reciprocal-dealing arrangements; and the fifth, with certain exceptions, prohibits an exclusive-dealing arrangement. Exempted from these prohibited conditional transactions are practices known as ‘‘traditional banking practices.’’

Specifically, section 106 prohibits a bank, in any manner, from fixing or varying the consideration for extending credit, leasing or selling property of any kind, or furnishing any service on the condition or requirement that the customer—

1. obtain additional credit, property, or service from the bank, other than a loan, discount, deposit, or trust service (a ‘‘traditional bank product’’);
2. obtain additional credit, property, or service from the bank’s parent holding company or the parent’s other subsidiaries;
3. provide additional credit, property, or service to the bank, other than those related to and usually provided in connection with a loan, discount, deposit, or trust service;
4. provide additional credit, property, or service to the bank’s parent holding company or any of the parent’s other subsidiaries; or
5. not obtain other credit, property, or service from the competitors of the bank, the bank’s parent holding company, or the parent’s other subsidiaries, except that the lending bank may impose conditions and requirements in a credit transaction to ensure the soundness of the credit.

3500.0.1.1 Section 106 Statutory Exceptions

The statutory ‘‘traditional bank product exception’’ of section 106 permits a bank to tie a product to a traditional bank product (a loan, discount, deposit, or trust service) offered by that bank, but not by any affiliated bank or nonbank. For example, a bank could condition the use of its messenger service on a customer’s maintaining a deposit account at the bank. Although the statutory traditional bank product exception appears to have been effective in preserving traditional relationships between a customer and bank, the statutory exception is limited in an important way. It does not extend to transactions involving products offered by affiliates. Section 106(b) provides a second statutory exception that authorizes the Board to prescribe exceptions by regulation or order when it determines that an exception will not be contrary to the purposes of this section.

Before the 1997 implementation of the revisions to Regulation Y, the tie-in provisions of section 106(b) applied to bank holding companies and their nonbank subsidiaries as though they were banks. The nonbank provisions were applied under section 4(c)(8) of the Bank Holding Company Act. A bank holding company and any nonbank subsidiary were prohibited from tying their products or services either to other products or services offered by the same company or to products or services offered by any affiliate, including a bank affiliate. With the 1997 revisions, *the tie-in prohibitions were eliminated for bank holding companies and their nonbank subsidiaries, except when electronic benefit transfer services are provided.* Bank holding companies and their nonbank subsidiaries are still subject to anti-tying restrictions with respect to electronic benefit transfer services, as set forth in section 7(i)(11) of the Food Stamp Act of 1977 (7 U.S.C. 2016(i)(11)). (See the tie-in arrangements discussion in section 3070.0.7.4.)

Section 106 prohibits not only tying arrangements, but reciprocity arrangements. Reciprocity arrangements condition the availability of, or vary the consideration of, one product on a customer's providing of another product. The statutory prohibition on reciprocity arrangements contains an exception to preserve traditional banking relationships. The exception provides that a bank may condition the availability of a product or service on the customer's providing to the bank some product or service "related to and usually provided in connection with" a loan, discount, deposit, or trust service. Like the statutory traditional bank product exception to the tying prohibition, the reciprocity prohibition does not apply to interaffiliate transactions. The 1997 Regulation Y revision extends the statutory exception for traditional banking relationships to cover such interaffiliate transactions.

3500.0.2 ANTI-TYING REGULATORY EXCEPTIONS

3500.0.2.1 Traditional Bank Product Exception

The traditional bank product exception of Regulation Y (12 C.F.R. 225.7 (b)(1)) permits a bank to extend credit, lease or sell property, provide any service, or fix or vary its consideration on the condition that a customer obtain a traditional bank product (that is, a loan, discount, deposit, or trust service) from an affiliate of the bank. Effective in April 1997, the traditional bank product exception was extended to affiliates' transactions. Interaffiliate arrangements are exempt to the same extent as interbank arrangements.

Section 106 and the Board's regulation also allow—

1. a broker-dealer affiliate to tell a customer that it can only receive placement services (or a discount thereon) if it obtains a loan from an affiliated bank, and
2. a broker-dealer affiliate to tell a customer that it can only receive placement services (or a discount thereon) if it obtains a loan from a nonbank affiliate.

This regulatory exception is a limited extension of the traditional bank product exception provided in section 106 and is coextensive with the statuatory exception.[1]

3500.0.2.2 Safe Harbor for Combined-Balance Discounts

A bank may vary the consideration for any product or package of products based on a customer's maintaining a combined minimum balance in certain products specified by the bank (eligible products) if—

1. the bank offers deposits, and all such deposits are eligible products, and
2. balances in deposits count at least as much as nondeposit products toward the minimum balance. (See Regulation Y, section 225.7 (b)(2).)

A question was raised as to whether insurance products may be included among the products offered by a bank as part of a combined-balance discount program (eligible products) operated pursuant to the Board's safe harbor, if the program otherwise meets the requirements of the safe harbor. If insurance products are deemed to be eligible products, it was also questioned whether the principal amount of annuity products may be counted towards the minimum balance, and whether insurance premiums may be counted towards the minimum balance for

1. See Chairman Greenspan's August 23, 1994, letter to the Honorable John D. Dingell, Chairman, Committee on Energy and Commerce, U.S. House of Representatives. See AD-94-68, August 26, 1994, and the Board's issuance of anti-tying exceptions on December 15, 1994, and April 20, 1995.

non-annuity insurance products. Board staff issued the following response to these questions.

To qualify for the Board's safe harbor, all deposits must be eligible products under the combined-balance discount program, and deposit balances must be weighed at least as much as nondeposit products towards the minimum balance.[2] The Board's requirement that deposit balances be weighed at least as much as nondeposit products towards the minimum balance was included in the safe harbor to allow banks and their affiliates to price products they include in a combined-balance program in an economically rational way—while limiting the bank's ability to use product weighting to require the purchase of certain nontraditional products. This requirement specifically provides for the inclusion of certain products with values that could be greater than the typical retail deposit, while allowing deposits to remain a viable way for customers to reach the minimum balance.

On this basis, any financial products offered by a bank or its affiliates, including insurance products, may be properly included among the eligible products in that bank's combined-balance discount program. The principal amount of an annuity may be counted in determining the size of the customer's balance in eligible products, as may the premiums paid in a given policy year on non-annuity insurance products. The principal amount of an annuity is closely analogous to the principal amount of a deposit, as both represent a customer's initial cash investment with the relevant financial institution. Similarly, insurance premiums are money actually paid by the customer to the insurance underwriter.

3500.0.2.2.1 Combined-Balance Discount—Members of a Household or Family, Taken Together, May Constitute a ''Customer''

A bank holding company's legal counsel raised a question whether members of a household or family, taken together, may be considered a ''customer'' for purposes of the combined-balance discount safe harbor set forth in section 225.7(b) of Regulation Y.

The bank holding company desired to offer its customers discounts on the products and services of its subsidiary banks if a customer's household maintains a specific minimum balance with its banks and their affiliates. The minimum balance would be computed by adding the balances held by an individual customer in products (both bank and nonbank) specified by the company's affiliated bank, including deposits, to balances held in the same products by all other members of that customer's household.

Board staff noted that the safe harbor would be available only if all deposits are eligible products under the combined-balance discount program and deposit balances are weighed at least as much as nondeposit products towards the minimum balance. Board staff also noted that aggregating balances held at the bank holding company's affiliates by members of a family or household would make it easier for customers to achieve the minimum balance necessary to receive the favorable pricing on bank products and services, and thus appear to be pro-consumer and not anticompetitive.

Accordingly, Board staff opined[3] that the term ''customer,'' as used in section 225.7(b)(2) of Regulation Y, may include separate individuals who (1) are all members of the same immediate family (as defined in section 225.41(b)(3) of Regulation Y) and (2) reside at the same address. Staff also indicated that the bank holding company must not operate the program in an anticompetitive manner.

3500.0.2.3 Safe Harbor for Foreign Transactions

The Board has adopted a safe harbor from the anti-tying rules for transactions with corporate customers that are incorporated or otherwise organized and that have their principal place of business outside the United States. This safe harbor also applies to individuals who are citizens of a foreign country and are not resident in the United States. (See Regulation Y, section 225.7(b)(3).) However, the safe harbor would not protect tying arrangements involving a customer that is a U.S.-incorporated division of a foreign country. Furthermore, the safe harbor would not shelter a transaction from other antitrust laws if they were otherwise applicable.

3500.0.3 APPLICABILITY OF ANTI-TYING EXCEPTIONS TO ENTITIES OTHER THAN BANKS

The Board's anti-tying rules adopt a definition of bank that clarifies that any exemptions afforded

2. Eligible products under the safe harbor are those ''products specified by the bank'' as part of the combined-balance discount program. (See 12 C.F.R. 225.7(b)(2).)

3. See the Board staff opinion dated November 26, 2002.

to banks would generally be applicable to credit card and other limited-purpose institutions and to U.S. branches and agencies of foreign banks.

3500.0.4 TIE-IN ARRANGEMENTS RELATING TO NONBANK BANKS

The Competitive Equality Banking Act, effective August 10, 1987, made nonbank banks and their affiliates subject to the anti-tying provisions of section 106 of the BHC Act Amendments and to the insider and preferential lending restrictions of section 22(h) of the Federal Reserve Act. Thus, the nonbank bank may not condition the granting of credit on the purchase of a product or service from the parent holding company or vice versa.

3500.0.5 VOLUNTARY VERSUS INVOLUNTARY TIE-IN ARRANGEMENTS

Voluntary as well as involuntary tie-ins have been a matter of concern. The customer, hoping to enhance his or her chance for bank accommodations (especially during periods of tight money), voluntarily patronizes subsidiaries of the bank. Voluntary tie-ins are said to have ‘‘just as serious’’ an economic effect as coercive ones because competition would be lessened to the extent that the tied product is no longer bought entirely on its economic merit.

3500.0.6 INSPECTION OBJECTIVES

1. To determine whether the bank holding company has adequate policies and procedures to ensure the compliance of its subsidiary banks with section 106(b) of the BHC Act Amendments.
2. To evaluate transactions between a company organized as a direct subsidiary of a bank holding company and affiliated banks for their compliance with federal laws and regulations and related policy guidance.
3. To ascertain, to the extent possible, that neither voluntary nor involuntary overt tie-in arrangements are present in credits extended by any BHC subsidiary bank.

3500.0.7 INSPECTION PROCEDURES

The Federal Reserve, as part of its inspections of bank holding companies and their subsidiaries and its examinations of state member banks and their subsidiaries, has had a long-standing policy that examiners should evaluate compliance with section 106(b) and the prohibitions against tie-in arrangements. During the course of all holding company inspections, the examiners should follow the inspection instructions set forth below, focusing on a bank holding company’s responsibility to oversee and safeguard against potentially illegal tie-in arrangements by its banking subsidiaries and affiliates. The examiner’s review should focus on (1) the bank holding company’s establishment and monitoring of the internal controls and procedures for each bank subsidiary or affiliate and on its monitoring of compliance with written policies and procedures pertaining to tie-in arrangements, (2) the training provided to management and staff who are responsible for monitoring banking subsidiaries and affiliates for compliance with anti-tying provisions, and (3) the extent to which the bank holding company oversees internal loan reviews of pertinent bank extensions of credit to borrowers whose credit facilities or services may be susceptible to improperly imposed tie-in arrangements in violation of section 106(b) or the Board’s regulations.

At a minimum, during the course of all bank holding company inspections, examiners are to thoroughly evaluate the organization’s monitoring and overseeing of compliance with section 106(b) and the Board’s regulations by its banking subsidiaries and affiliates. Examiners should use the following inspection procedures and checklist below. In addition, before beginning an inspection of any banking organization, Reserve Bank staff should evaluate the activities of the target banking organization to determine whether it presents an increased opportunity for a bank to illegally tie its services or credit facilities to other services or facilities. If it does, the current inspection procedures, plus the checklist, should be used to check for compliance with section 106(b) and the Board’s anti-tying regulations.

Following are the inspection procedures for tie-in arrangements:

1. Review the BHC’s internal controls that are intended to prevent illegal tie-ins by its banks and affiliates.
2. Review the holding company’s program to monitor subsidiary banks and their affiliates’ internal loan reviews. Such reviews should

include the inspection of credit files for loan agreements and other documentation that place conditions or restrictions on borrowers that indicate a possible tie-in. The bank holding company should conduct or oversee internal loan reviews of files for insurance applications, particularly if an insurance subsidiary maintains a consistently high penetration rate on credits granted by bank affiliates, which could indicate the presence of voluntary or involuntary tie-in arrangements.

3. Ascertain whether the bank holding company has policies requiring the periodic review of servicing contracts between the bank and its affiliates, as well as policies for reviewing the substance of actual transactions, to determine—
   a. the capacity in which the bank and its tied affiliate are acting (for example, is it acting as principal on its own behalf or as an agent for the affiliate bank);
   b. the nature of all services provided; and
   c. billing arrangements, frequency of billing, method of computation, and basis for such fees.
4. Review the bank holding company's policy statement on the prohibition of tie-in arrangements, the adequacy of training provided to employees, and whether management and its internal auditors have periodically confirmed that there is full compliance with such internal policy.
5. Report on the "Examiner's Comments and Matters Requiring Special Board Attention" page any significant comments on tie-ins reviewed. (Comments would also be appropriate if controls to prevent tie-ins had not been established.)

3500.0.8 INSPECTION CHECKLIST FOR COMPLIANCE WITH THE TIE-IN ARRANGEMENT PROHIBITIONS

Provided below is a checklist of questions that has been designed to ensure, during Federal Reserve inspections, an examiner's adequate, complete evaluation of a banking organization's compliance with section 106(b) of the BHC Act Amendments and the Board's anti-tying regulations. The checklist generally addresses written policies and procedures in this area and training and internal audit programs.

A. Written Policies and Procedures

1. Does the bank holding company have a holding-company-wide policy statement that—
   a. states that certain tie-in arrangements are illegal and
   b. provides specific examples of impermissible practices relevant to the product line?
2. Do the bank holding company's bank subsidiaries and affiliates have copies of the holding company's written policy statement referred to in question A.1, and has it been revised, as appropriate, to provide specific examples of impermissible practices relevant to the particular product line?
3. Is the policy statement reviewed and updated regularly to ensure that the examples accurately reflect the products and services offered by the holding company and its subsidiaries?
4. Does the policy statement contain procedures for employees to follow if questions arise concerning the application of the prohibitions against tie-ins?
5. If the bank holding company does not have the holding-company-wide policy statement referred to in question A.1 (and that meets the requirements in questions A.2, 3, and 4), does each of the holding company's banking subsidiaries and affiliates have its own policy statement that meets those requirements?

B. Training

1. Do the bank holding company and its bank and nonbank subsidiaries have training programs to ensure that employees are aware of the prohibitions against illegal tie-in arrangements?
2. Is participation in a training program required of new employees?
3. Is an annual compliance-review program required for employees?
4. If the inspection involves a bank that is not part of a holding company structure, does the bank meet the requirements described in questions B.1 through 3?

C. Audit Procedures

1. Do the bank holding company and its bank subsidiaries and affiliates have annual audit procedures in place to ensure compliance with the prohibitions on tie-in arrangements?
2. Do counsel or other competent experts review

transactions in the appropriate areas of the bank holding company, its bank subsidiaries, and affiliates to ensure compliance with the prohibitions against tie-in arrangements?

A foreign bank that operates in the United States through a branch, agency, or commercial lending company subsidiary, or that owns or controls a U.S. bank or Edge corporation, must conform to the nonbanking restrictions of the BHC Act.

The BHC Act also provides exemptions that permit a foreign bank with U.S. banking operations to engage in certain nonbanking activities. As with domestic bank holding companies, pursuant to section 4(c)(8), a foreign bank may own shares of any company that the Board has determined to be so closely related to banking or managing or controlling banks as to be a proper incident thereto. As described below, a foreign bank may also qualify for additional exemptions pursuant to sections 4(c)(9) and 2(h). These latter exemptions apply only to foreign banking institutions and seek to limit the extraterritorial application of federal banking law while preserving national treatment of these institutions' domestic counterparts.

3510.0.1 REGULATION K

Regulation K implements the nonbanking restrictions of section 4 of the BHC Act by applying the limits to any foreign banking organization (FBO). An FBO is (1) any foreign bank that either operates a branch, agency, or commercial lending company subsidiary in the United States, or that controls a U.S. bank, and (2) any company that owns or controls a foreign bank described in (1). (See 12 C.F.R. 211.21(o) to apply these limits.) Regulation K requires any FBO that engages in activities in the United States to conform those activities to the nonbanking restrictions by either limiting the activities or obtaining an exemption. (See 12 C.F.R. 211.23(n).)

Regulation K implements statutory exemptions from the BHC Act for certain activities of foreign banks. Sections 4(c)(9) and 2(h) of the BHC Act provide exemptions that are available to ''qualifying foreign banking organizations'' (QFBOs).

Section 2(h) allows a foreign company that is principally engaged in banking business outside the United States to own foreign affiliates that engage in impermissible nonfinancial activities in the United States, subject to certain requirements. These include requirements that the foreign affiliate must derive most of its business from outside the United States and that it may engage in the United States in only the same lines of business it conducts outside the United States.

Section 4(c)(9) allows the Board to exempt foreign companies from the nonbank activity restrictions of the BHC Act when the exemption would not be substantially at variance with the BHC Act and would be in the public interest. Under this authority, the Board has exempted, among other things, all foreign activities of QFBOs from the nonbanking prohibitions of the BHC Act.

To qualify as a QFBO (and, hence, to be eligible for the 4(c)(9) and 2(h) exemptions), an FBO must chiefly engage in banking activities worldwide; that is, it must demonstrate that more than half of its business is banking and that more than half of its banking business is outside the United States. Regulation K sets forth a multistep test for determining when an FBO primarily engages in banking activities worldwide. This so-called QFBO test is met if ''disregarding [the FBO's] U.S. banking business, more than half of [the FBO's] worldwide business is banking; and more than half of its banking business is outside the United States.'' (See 12 C.F.R. 211.23(a).)

Under the QFBO test, an FBO must satisfy at least two of the following criteria:

1. the banking assets held outside the United States must exceed total worldwide nonbanking assets;
2. revenues derived from the business of banking outside the United States must exceed total revenues derived from its worldwide nonbanking business; or
3. net income derived from the business of banking outside the United States must exceed total net income derived from its worldwide nonbanking business.

In addition, the FBO must meet at least two of the following criteria:

1. the banking assets held outside the United States must exceed the banking assets held in the United States;
2. revenues derived from the business of banking outside the United States must exceed the revenues derived from the business of banking in the United States; or
3. net income derived from the business of banking outside the United States must exceed

net income from the business of banking in the United States.

Regulation K provides rules on how to calculate the assets, revenues, and net income of the FBO and its foreign subsidiaries.[1] In calculating assets, revenues, or net income held or derived from the business of banking ''outside the United States,'' the FBO may not include assets, revenues, or net income, whether held or derived directly or indirectly, of a subsidiary bank, a branch, an agency, a commercial lending company, or another company engaged in the business of banking in the United States, including any territory of the United States, Puerto Rico, Guam, American Samoa, or the Virgin Islands.

Regulation K provides a broader definition of ''banking'' for use in the QFBO test. A QFBO may include assets, revenues, and income from any activity that a U.S. bank holding company may perform abroad pursuant to section 211.10 of Regulation K, if the activity is conducted by the foreign bank itself or by a subsidiary. Thus, for example, an FBO may treat certain insurance and securities activities as banking activities for determining QFBO status. (See 12 C.F.R. 211.23(b)(2) and 211.10.) However, this broader definition of banking applies to the QFBO test only. It does not define the types of permissible banking activities that a QFBO may perform in the United States.

An FBO may be unable to satisfy the QFBO test because a substantial part of its financial activities is conducted outside of the foreign bank itself. This might occur, for example, when an FBO conducts substantial life insurance activities through a parent or sister company of the foreign bank. Such an FBO may nevertheless be eligible for some more limited exemptive relief if it meets a modified test. Under this modified test, when calculating assets, revenues, or net income for the prong of the QFBO test that measures whether more than half of an FBO's business is banking, the FBO may count banking activities conducted outside the foreign banking chain. For the other prong of the test, which determines whether more than half of an FBO's banking business is outside the United States, the banking-chain requirement would still apply. An FBO that meets this modified test will be eligible for all of the exemptions other than the exemption for limited commercial and industrial activities provided under section 2(h) (as implemented by 12 C.F.R. 211.23(f)(5)).[2] However, any foreign banks within the FBO that independently meet the QFBO test would be eligible for all of the exemptions available to QFBOs. The modified test is intended to limit the extraterritorial effect of the BHC Act on foreign firms and to avoid penalizing a consolidated group that engages mostly in activities permissible for a U.S. banking organization.

An FBO that does not qualify, or that ceased to qualify for two consecutive years (as reported in the Annual Report of Foreign Banking Organizations, Form FR Y-7, that the FBO filed with the Board), is not eligible for the exemptions afforded by sections 2(h) and 4(c)(9). An FBO that does not qualify for these exemptions may only engage in activities in the United States that are permissible for a domestic bank holding company. An FBO that no longer qualifies under the QFBO test may seek a determination of continued eligibility from the Board. Otherwise, the FBO may only continue to engage in activities begun, or retain investments acquired, before the end of the first fiscal year in which it failed to qualify. Other activities or investments must cease or be divested within three months of the filing of the second FR Y-7, which demonstrates that the foreign bank no longer qualifies for the exemptions. The Board also has the authority to grant exemptive relief under Regulation K to foreign organizations that do not include foreign banks. (See 12 C.F.R. 211.23(e).)

3510.0.2 NONBANKING EXEMPTIONS FROM THE BHC ACT FOR QFBOs UNDER SECTIONS 4(C)(9) AND 2(H)

Sections 2(h) and 4(c)(9) of the BHC Act are exemptive provisions that seek to limit the extraterritorial impact of federal banking law. While there is considerable overlap in these two sections (for example, only a QFBO is eligible for both kinds of exemptions), they also have significant differences (for example, section 2(h) only exempts certain types of activities, whereas

1. A subsidiary is any company that either (1) has 25 percent or more of its voting shares directly or indirectly owned, controlled, or held with the power to vote by a company, including a foreign bank or a foreign banking organization, or (2) is otherwise controlled or capable of being controlled by a foreign bank or foreign banking organization. See 12 C.F.R. 211.21(z).

2. Any FBO that qualifies as a financial holding company (FHC) would be able to make merchant banking investments and investments in connection with its insurance business in the United States to the extent permitted for an FHC. The lack of eligibility for the exemption in section 211.23(f)(5) would not negate or otherwise affect such authority.

section 4(c)(9) may also exempt specific activities or investments upon Board order).

3510.0.2.1 Section 4(c)(9) of the BHC Act

Section 4(c)(9) of the BHC Act authorizes the Board to exempt the U.S. activities of a QFBO, through order or regulation, if the exemption ''would not be substantially at variance with the purposes of [the BHC Act] and would be in the public interest.'' The Board has implemented this provision in Regulation K to permit a QFBO to engage directly or indirectly in any activity outside of the United States; hold the shares of any company that engages in activities in the United States that are ''incidental'' to foreign business; hold a *noncontrolling* interest in any chiefly foreign company that engages in any activity in the United States, if the foreign company derives more than half its assets and revenues from outside the United States; or own or control voting shares of any company acquired in good faith in a fiduciary capacity as permitted by section 4(c)(4) of the BHC Act. An FBO is *not* permitted to own more than 10 percent of the shares of a foreign company that directly or indirectly engages in underwriting, selling, or distributing securities to an extent not permitted for bank holding companies.[3] (See 12 C.F.R. 211.23(f)(1), (2), (3), (4), and 5(i) and (ii).)

The provision that permits a QFBO to own shares of a foreign company that engages in incidental, international activities in the United States has been defined by interpretation. That is, an activity is ''incidental'' to a foreign company's activities outside of the United States only if it is an activity that an Edge or agreement corporation may perform in the United States. Section 211.6 of Regulation K defines the permissible activities of an Edge or agreement corporation.[4] An application to the Federal Reserve is not required before a QFBO engages in an activity that is incidental to international business under this exemption.

A QFBO may also request a specific exemption from the BHC Act under section 4(c)(9) to perform otherwise impermissible activities in the United States. The Board considers these requests on a case-by-case basis.

3510.0.2.2 Section 2(h) of the BHC Act

Section 2(h) of the BHC Act permits a QFBO to own or control the voting shares of a foreign company that is principally engaged in business outside of the United States and that engages directly or indirectly in activities in the United States that are the same as or related to the company's lines of business abroad.

Section 2(h) is designed to allow a QFBO that has foreign commercial or industrial affiliates to continue to hold those affiliates, even if the affiliate engages in activities in the United States that would ordinarily be prohibited by section 4 of the BHC Act. The U.S. activities must be the same kind of activity the affiliate conducts outside the United States and the foreign affiliate must be chiefly foreign, that is, it must derive more than half of its assets and revenues from outside the United States. The U.S. branches and agencies of a QFBO may not lend to an affiliate held under section 2(h) except on an arm's-length basis.

A QFBO may *not* engage in financial activities in the United States on the basis of section 2(h). Regulation K provides a list of activities that are considered ''financial.'' These activities should be referenced to Division H (Finance, Insurance, and Real Estate) of the Standard Industrial Classifications (SIC), as well as to selected activities in other divisions of the SIC that are considered financial in nature.[5]

3. Specifically, Regulation K permits a QFBO to (1) engage in activities of any kind outside the United States; (2) engage directly in activities in the United States that are incidental to its activities outside the United States; (3) own or control voting shares of any company that is not engaged, directly or indirectly, in any activities in the United States other than those that are incidental to the international or foreign business of such company; and (4) own or control voting shares of any company in a fiduciary capacity under circumstances that would entitle such shareholding to an exemption under section 4(c)(4) of the BHC Act if the shares were held or acquired by a bank.

4. Generally, these activities must have an international nexus and may consist of receiving deposits from foreign governments and persons; receiving deposits from other persons under certain conditions; holding or investing liquid funds in certain forms or instruments; engaging in certain credit activities or borrowing funds; receiving or collecting payments under certain conditions; performing foreign-exchange activities; acting as a fiduciary, an investment adviser, or a broker or performing other activities related to investing under certain conditions; providing banking services for employees; and engaging in other activities with prior Board approval. See 12 C.F.R. 211.6(a).

5. The North American Industry Classification System (NAIS) replaces the use of SIC codes. The NAICS codes differ from the SIC codes. To evaluate compliance with section 2(h) of the BHC Act, examiners should consult Regulation K directly when determining whether particular activities are permissible. Regulation K refers to NAICS codes.

Section 2(h) is implemented in Regulation K as follows: A QFBO may own or control voting shares of a foreign company that is engaged directly or indirectly in business in the United States other than that which is incidental to its international or foreign business, subject to the following limitations:

1. More than 50 percent of the foreign company's consolidated assets shall be located, and consolidated revenues derived from, outside the United States.[6] (See 12 C.F.R. 211.23(f)(5)(i).)
2. The foreign company shall not directly underwrite, sell, or distribute, nor directly own or control more than 10 percent of the voting shares of a company that underwrites, sells, or distributes, securities in the United States except to the extent permitted bank holding companies. (See 12 C.F.R. 211.23(f)(5)(ii), 12 C.F.R. 225.124, and section 3510.0.2.3.)

Regulation K places additional restrictions on the 2(h) exemption when a QFBO owns a foreign company that is a subsidiary. Specifically, the foreign company must be, or must control, an operating company. Its direct or indirect activities in the United States are subject to the following limitations:

1. The foreign company's activities in the United States shall be the same kind of activities or related to the activities engaged in directly or indirectly by the foreign company abroad, as measured by the "establishment" categories of the SIC. An activity in the United States shall be considered related to an activity outside the United States if it consists of supply, distribution, or sales in furtherance of the activity. (See 12 C.F.R. 211.23(f)(5)(iii)(A).)
2. The foreign company may engage in activities in the United States that consist of banking securities, insurance or other financial operations, or types of activities permitted by regulation or order under section 4(c)(8) of the BHC Act only under regulations of the Board or with the prior approval of the Board, subject to the following:
   a. Activities within Division H (Finance, Insurance, and Real Estate) of the SIC shall be considered banking or financial operations for this purpose, with the exception of acting as operators of nonresidential buildings (SIC 6512), operators of apartment buildings (SIC 6513), operators of dwellings other than apartment buildings (SIC 6514), operators of residential mobile home sites (SIC 6515), and operating title abstract offices (SIC 6541).
   b. The following activities shall be considered financial activities and may be engaged in only with the approval of the Board under section 211.23(g) of Regulation K:[7] credit reporting services (SIC 7323); computer and data processing services (SIC 7371 to 7379); armored car services (SIC 7381); management consulting (SIC 8732, 8741, 8742, and 8748); certain rental and leasing activities (SIC 4741, 7352, 7353, 7359, 7513, 7514, 7515, and 7519); accounting, auditing, and bookkeeping services (SIC 8721); courier services (SIC 4215 and 4513); and arrangement of passenger transportation (SIC 4724, 4725, and 4729).

The restriction in paragraph 2b. above reflects the fact that section 2(h) is not the source of authority for a QFBO to engage in banking, securities, or other financial activities in the United States through a subsidiary.

The section 2(h) exemption only applies to the nonfinancial, nonbanking activities of an FBO. To preserve competitive equity, the exemption does not permit an FBO to control a foreign nonbanking company that engages in, or that holds more than 5 percent of the voting shares of another company that engages in, banking, securities, insurance, real estate, or other financial activities in the United States. These activities may be performed only with Federal Reserve approval under section 4(c)(8) or 4(c)(9) of the BHC Act.

3510.0.2.3 Foreign Banks' Underwriting of Securities

A number of foreign banks, which are subject to

6. If the foreign company fails to meet the requirements of paragraph (f)(5)(i) (12 C.F.R. 211.23) for two consecutive years (as reflected in annual reports (FR Y-7) the FBO filed with the Board), the foreign company must be divested or its activities must be terminated within one year of the filing of the second consecutive annual report that reflects nonconformance with the requirements of paragraph (f)(5)(i), unless the Board grants consent to retain the investment under 12 C.F.R. 211.23(g).

7. Section 211.23(g) of Regulation K permits a foreign banking organization to request a case-by-case exemption from the nonbanking restrictions to engage in otherwise impermissible activities pursuant to section 4(c)(9) of the BHC Act.

the BHC Act, had participated as co-managers in the underwriting of securities that were distributed in the United States. These banks did not have the authority to engage in securities underwriting activity in the United States. The U.S. offices of affiliates of the foreign banks were used to engage in activities conducted in support of the underwriting transactions, for which these U.S. offices were compensated by the foreign bank. The foreign bank became a member of the underwriting syndicate but it did not distribute any of the securities in the United States or elsewhere. The foreign banks took the position that they were not engaged in underwriting in the United States because any underwriting obligation was booked outside the United States.

A foreign bank that is subject to the BHC Act may engage in underwriting activities in the United States only if it has been authorized under section 4 of that act. Section 225.124 of the Board's Regulation Y states that a foreign bank will not be considered to be engaged in the activity of underwriting in the United States if the shares to be underwritten are distributed outside the United States. In the transactions in question, all of the securities were distributed in the United States.

In 1985, the Board amended Regulation K in section 211.23(f)(5)(ii) to provide clarification that a foreign banking organization shall not ''directly underwrite, sell, or distribute, nor own or control more than 10 percent of the voting shares of a company that underwrites, sells, or distributes securities in the United States, except to the extent permitted bank holding companies.'' When proposing this provision, the Board stated ''...that no part of the prohibited underwriting process may take place in the United States and that the prohibition on the activity does not depend on the activity being conducted through an office or subsidiary in the United States.''

Regulation K defines ''engaged in business'' and ''engaged in activities'' to mean conducting an activity through an office or subsidiary in the United States. The Regulation K definition of ''engaged in business,'' adopted in 1979, however, does not authorize foreign banking organizations to evade regulatory restrictions on securities activities in the United States by using U.S. offices and affiliates to facilitate the prohibited activity. Also, the framework of the Gramm-Leach-Bliley Act (the GLB Act) requires that banking organizations meet certain financial and managerial requirements of the GLB Act and the Board's Regulation K to engage in these activities in the United States.

The Board therefore issued an interpretation on February 7, 2003 (effective February 19, 2003), clarifying that the underwriting by foreign banks of securities to be distributed in the United States is an activity conducted in the United States, regardless of the location at which the underwriting risk is assumed and the underwriting fees are booked. Consequently, any banking organization that wishes to engage in such activity must either be a financial holding company under the GLB Act or have authority to engage in underwriting activity under section 4(c)(8) of the BHC Act (so-called section 20 authority). Revenue generated by underwriting bank-ineligible securities in such transactions should be attributed to the section 20 company for those foreign banks that operate under section 20 authority. (See 12 C.F.R. 211.605.)

3510.0.3 GRANDFATHER RIGHTS

Section 8 of the International Banking Act (IBA) provides grandfather rights to foreign banks that operated a branch, agency, or subsidiary commercial lending company at the time of enactment of the IBA.

Section 8(c) of the IBA permanently grandfathers activities engaged in directly or through an affiliate on or before July 26, 1978, or for which an application to engage in such activities had been filed on or before that date.[8] Grandfathered nonbanking activities may not be expanded through the acquisition of any interest in or the assets of a going concern engaged in the same activities. The Board may, subject to opportunity for hearing, terminate these grandfather rights where it is necessary to prevent undue concentration of resources, decreased or unfair competition, conflicts of interest, or unsound banking practices in the United States. A foreign bank that is required to terminate its indirect grandfathered activity may retain ownership of the shares of the grandfathered company for a period of two years from the date of the Board's action.

Grandfather rights conferred under section 8(c) of the IBA shall terminate immediately upon the filing of an FHC declaration by the foreign bank or foreign company. With respect to a foreign bank or foreign company that did

8. The term ''affiliate'' means any company that controls, is controlled by, or is under common control with the foreign bank or the parent of the foreign bank.

not file an FHC declaration by November 12, 2001, the Board has the authority, giving due regard to the principle of national treatment and equality of competitive opportunity, to impose such restrictions and requirements on the conduct of any grandfathered activities as are comparable to those imposed on a U.S. FHC, including a requirement to conduct such activities in compliance with any prudential safeguards established under 12 U.S.C. 1828a.

3510.0.4 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Foreign banking organizations	1841(h) 1843(c)(9) 3106	211.23(f)(5)

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

This section provides a ''grandfather'' exemption from the general prohibitions of section 4 for a small group of bank holding companies which are themselves banks. For such bank holding companies and their wholly-owned subsidiaries, the exemption provides for continued ownership of nonbank shares which were lawfully acquired and owned directly or indirectly prior to enactment of the Act (May 9, 1956). At the time of its enactment, this section accommodated only three bank holding companies.

It should be noted that this section, in referring to shares indirectly owned through subsidiaries, limits the exemption to ''wholly-owned subsidiaries.'' The reason for this limitation apparently ties to the Federal Reserve Act and other federal banking statutes which permit National and member banks to engage through wholly-owned operating subsidiaries in various bank-related activities.

It is required that the shares covered under this section have been continuously held since May 9, 1956. Such interpretation is in keeping with other sections of the Act.

Section 4(c)(11) (Authorization for BHCs to Reorganize Share Ownership Held on the Basis of Any Section 4 Exemption) Section 3530.0

Section 4(c)(11) was adopted to authorize bank holding companies to reorganize share ownership held on the basis of any section 4 exemption. Reorganization is permitted with respect to section 4(a)(2) grandfathered activities engaged in prior to June 30, 1968, retaining indefinite grandfather authority. Shares held pursuant to Board approval under section 4(c)(8) or any other section 4 exemption also come within section 4(c)(11)'s reorganization authority.

Under section 4(c)(11), a bank holding company is authorized to reorganize its share ownerships, shift its activities among its various entities and form new subsidiaries without Board approval as long as there is no change in the activities of the bank holding company system. Congress also felt it entirely appropriate for these companies to expand their activities so long as such expansion did not produce anticompetitive or other adverse effects. Accordingly, internal expansion of the grandfathered activities was permitted but the provision was added that this section does not authorize the grandfathered companies to acquire, either directly or indirectly, any interest in or the assets of any going concern outside the holding company system (unless the acquisition is pursuant to a contract entered into before June 30, 1968). Congress reasoned that purchasing a going concern engaged in the grandfathered activities of a holding company would tend to have an anticompetitive effect in that it would reduce the number of firms competing against each other in a given activity.

This section provided an exemption from the general prohibitions of section 4 for shares held or activities which became subject to the Act by the 1970 amendments.

Section 4(c)(12) provided not only for continued ownership of shares or performance of activities so held or performed as of December 31, 1970, but also for others permitted afterward by the Board. As stated in subparagraphs (A) and (B) of section 4(c)(12), the 10-year exemption applied if such bank holding companies: (A)(i) ceased to be bank holding companies by December 31, 1980; or (A)(ii) ceased to retain direct or indirect ownership of the nonbank shares or engage in the nonbank activities by December 31, 1980; or (B) complied with such other condition as the Board may prescribe.

A company was required to file an irrevocable declaration that it would cease to be a bank holding company by January 1, 1981, unless the Board granted it hardship exemption under section 4(d) of the Act. Such a company could then expand its nonbanking activities *de novo* without notification to the Board and could acquire a going concern nonbank company 45 days after informing the appropriate Reserve Bank of the proposed acquisition unless notified otherwise within that time. If an irrevocable declaration was not filed, then no acquisition could have been made or activities commenced under section 4(c)(12) except with prior Board approval. These limitations did not apply to acquisitions made pursuant to a binding commitment entered into before March 23, 1971.

Few bank holding companies have claimed an exemption under section 4(c)(12). It is unlikely that many situations involving section 4(c)(12) will be encountered by inspection personnel. However, if a 4(c)(12) company has committed to cease the nonbanking activities examiners must ensure that the divestiture has occurred.

3540.0.1 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws* [1]	*Regulations* [2]	*Interpretations* [3]	*Orders*
Divestitures		225.138		
Successor rights				1977 FRB 946

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. Federal Reserve Regulatory Service reference.

Section 4(c)(13) of the BHC Act governs the international activities of bank holding companies. In general, the act authorizes the Board to permit domestic bank holding companies to invest in companies that do no business in the United States except what is incidental to international or foreign business. Bank holding companies may invest in the same companies as Edge corporations.

3550.0.1 INVESTMENTS AND ACTIVITIES ABROAD

The investment provisions of Regulation K (sections 211.8, 211.9, and 211.10) implement section 4(c)(13) of the BHC Act. In general, an "investor" under Regulation K may invest, directly or indirectly, in a subsidiary or joint venture or may make portfolio investments, subject to the limits in section 211.8 and the general provisions in section 211.9(a). (See SR-02-03 and SR-02-02.)

Bank holding companies may invest in the same types of entities as Edge and agreement corporations. However, member banks may invest directly in only foreign banks; domestic or foreign organizations formed for the sole purpose of holding shares of a foreign bank; foreign organizations formed for the sole purpose of performing nominee, fiduciary, or other banking services incidental to the activities of a foreign branch or foreign bank affiliate of the member bank; and subsidiaries established pursuant to section 211.4(a)(8) of Regulation K (that is, a company that engages solely in activities in which the member bank is permitted to engage or that are incidental to the activities of the member bank's foreign branch). (See all sections of Regulation K for any other activity or investment authorizations, limitations, requirements, or prohibitions not discussed in this section.)

In general, the Board has limited the types of activities that a bank holding company may engage in through the ownership of foreign companies to banking or financially related activities, and to those that are necessary to carry on such activities. These include all of the activities permitted under section 211.10 of Regulation K and section 4(c)(8) of the BHC Act, including equity securities underwriting and management consulting. Many of the activities permitted abroad are not subject to the same limits as those imposed domestically under section 4(c)(8) (for example, brokerage of all types of insurance is permitted abroad).

Activities abroad, whether conducted directly or indirectly, are to be confined to activities of a banking or financial nature and to those that are necessary to carry on such activities. At all times, investors[1] must act in accordance with high standards of banking or financial prudence, having due regard for diversification of risks, suitable liquidity, and adequacy of capital. The Board follows the policy of allowing activities abroad to be organized and operated as best meets corporate policies. The following provides a limited discussion of general investment activities under Regulation K. The regulation should be referred to for more specific requirements and limitations.

In general, an investor may make (1) an investment in a subsidiary, (2) an investment in a joint venture, or (3) a portfolio investment in an organization. With regard to an investment in a subsidiary, the subsidiary must engage in activities authorized under section 211.10 of Regulation K, or in other activities that the Board has determined to be permissible (for a particular case). In the acquisition of a going concern, existing activities that are not otherwise permissible for a subsidiary may account for not more than 5 percent of either the acquired organization's consolidated assets or consolidated revenues. For an investment in a joint venture, no more than 10 percent of the joint venture's consolidated assets or consolidated revenues can be attributable to activities that are not listed in section 211.10.

For portfolio investments in an organization, the investor and its affiliates' total direct and indirect portfolio investments in an organization that is engaged in activities not permissible for joint ventures, when combined with all other shares in the organization (held under any other authority), cannot exceed—

1. 40 percent of the total equity of the organization, or
2. 19.9 percent of the organization's voting shares.

In addition to the individual investment limits, these portfolio investments are subject to an

1. For purposes of sections 211.8, 211.9, and 211.10 of Regulation K, a direct subsidiary of a member bank is deemed to be an investor.

aggregate equity limit. (See section 211.10(a)(15) of Regulation K.) For investments in organizations engaged in activities that are not permissible for joint ventures, when combined with shares held directly and indirectly by the investor and its affiliates under the equity dealing provisions of Regulation K, the investments cannot exceed—

1. 25 percent of the bank holding company's tier 1 capital, where the investor is a bank holding company;
2. 20 percent of the investor's tier 1 capital, where the investor is a member bank;[2] and
3. the lesser of 20 percent of any parent insured bank's tier 1 capital or 100 percent of the investor's tier 1 capital, for any other investor.

3550.0.2 INVESTMENT PROCEDURES

Except as the Board may otherwise determine, direct and indirect investments must be made in accordance with the general-consent, limited-general-consent, prior-notice, or specific-consent procedures of section 211.9 of Regulation K. The investment procedures of section 211.9(a) include the following requirements:

1. *Minimum capital adequacy standards.* The investor, the bank holding company, and the member bank must be in compliance with applicable minimum standards for capital adequacy set out in the capital adequacy guidelines. If the investor is an Edge or agreement corporation, the minimum capital required is total and tier 1 capital ratios of 8 percent and 4 percent, respectively.
2. *Composite rating.* For an investor to make investments under the general-consent or limited-general-consent procedures of sections 211.9(b) and (c), the investor and any parent insured bank must have received a composite rating of at least 2 at the most recent examination.
3. *Modification or suspension of procedures.* The Board may, at any time upon notice, modify or suspend the investment procedures for any investor or for the acquisition of shares of organizations engaged in particular kinds of activities.
4. *Long-range investment plan.* Any investor may submit a long-range investment plan to the Board for its specific consent. If approved by the Board, the plan shall be subject to the other procedures of section 211.9 only to the extent the Board determines is necessary to ensure the safety and soundness of the operations of the investor and its affiliates.
5. *Prior specific consent for initial investment.* For its initial investment in its first subsidiary or joint venture under subpart A of Regulation K, an investor must apply for and receive the prior specific consent of the Board, unless an affiliate previously has received approval to make such an investment.
6. *Expiration of investment authority.* Authority to make investments that was granted under prior-notice or specific-consent procedures shall expire one year from the earliest date on which the authority could have been exercised, unless the Board determines a longer period shall apply.
7. *Conditional approval; access to information.* The Board may impose such conditions on investment authority granted under section 211.9 as it deems necessary. The Board may also require termination of any activities conducted under subpart A of Regulation K, if an investor is unable to provide information on its activities or those of its affiliates that the Board deems necessary to determine and enforce compliance with U.S. banking laws.

3550.0.3 GENERAL CONSENT FOR WELL-CAPITALIZED AND WELL-MANAGED INVESTORS

The Board has granted its limited general consent to make investments by well-capitalized and well-managed investors. For these general-consent provisions to apply, the investor, any parent-insured bank, and any parent bank holding company must be well capitalized and well managed both before and immediately after the proposed investment. The investments are subject to the limitations discussed below.

3550.0.3.1 Individual Limit for Investment in a Subsidiary

The Board grants its general consent for investments by well-capitalized and well-managed investors, subject to certain investment limitations. For an investment in a subsidiary, the total amount that may be invested directly or indirectly (in one transaction or a series of transac-

2. For this purpose, a direct subsidiary of a member bank is deemed to be an investor.

tions) may not exceed 10 percent of the investor's tier 1 capital, where the investor is a bank holding company; 2 percent of the investor's tier 1 capital, where the investor is a member bank; or the lesser of 2 percent of the tier 1 capital of any parent-insured bank or 10 percent of the investor's tier 1 capital, for any other investor.

3550.0.3.2 Individual Limit for Investments in a Joint Venture

For individual investments in a joint venture, the total amount invested directly or indirectly (in one transaction or a series of transactions) may not exceed 5 percent of the investor's tier 1 capital, where the investor is a bank holding company; 1 percent of the investor's tier 1 capital, where the investor is a member bank; or the lesser of 1 percent of the tier 1 capital of any parent-insured bank or 5 percent of investor's tier 1 capital, for any other investor.

3550.0.3.3 Individual Limit for Portfolio Investment

For a portfolio investment, the total amount invested directly or indirectly (in one transaction or a series of transactions) in such company, general partnership, or unlimited-liability company cannot exceed the lesser of $25 million or—

1. 5 percent of the investor's tier 1 capital, in the case of a bank holding company or its subsidiary or an Edge corporation engaged in banking; or
2. 25 percent of the investor's tier 1 capital, in the case of an Edge corporation not engaged in banking.

3550.0.3.4 Aggregate Investment Limits

The amount of all investments made, directly or indirectly, during the previous 12-month period under section 211.9, when aggregated with the proposed investment, shall not exceed 20 percent of the investor's tier 1 capital, where the investor is a bank holding company; 10 percent of the investor's tier 1 capital, where the investor is a member bank; or the lesser of 10 percent of the tier 1 capital of any parent-insured bank or 50 percent of the tier 1 capital of the investor, for any other investor.

3550.0.4 LIMITED GENERAL CONSENT FOR AN INVESTOR THAT IS NOT WELL CAPITALIZED OR WELL MANAGED

3550.0.4.1 Individual Limit

For investors that are not well capitalized and well managed, the Board has granted limited general consent for an investor to make an investment in a subsidiary or joint venture, or to make a portfolio investment. The total amount invested, directly or indirectly (in one transaction or a series of transactions), cannot exceed the lesser of $25 million or 5 percent of the investor's tier 1 capital, where the investor is a bank holding company; 1 percent of the investor's tier 1 capital, where the investor is a member bank; or the lesser of 1 percent of any parent insured bank's tier 1 capital or 5 percent of the investor's tier 1 capital, for any other investor.

3550.0.4.2 Aggregate Limit

The amount of limited-general-consent investments made by such an investor directly or indirectly during the previous 12-month period, when aggregated with the proposed investment, cannot exceed 10 percent of the investor's tier 1 capital, where the investor is a bank holding company; 5 percent of the investor's tier 1 capital, where the investor is a member bank; and the lesser of 5 percent of any parent insured bank's tier 1 capital or 25 percent of the investor's tier 1 capital, for any other investor.

3550.0.5 CALCULATING COMPLIANCE WITH THE INDIVIDUAL AND AGGREGATE GENERAL-CONSENT LIMITS

When determining compliance with the individual and aggregate general-consent limits, an investment by an investor in a subsidiary can only be counted once, notwithstanding that the subsidiary may, within 12 months of making the investment, downstream all or any part of the investment to another subsidiary. Also, when determining compliance with these limits, an investor is not required to combine the value of all shares of an organization held in trading or dealing accounts under section 211.10(a)(15) of

Regulation K with investments in the same organization.

3550.0.6 OTHER ELIGIBLE INVESTMENTS UNDER GENERAL CONSENT

In addition to the general-consent authority already discussed, the Board has granted its general consent for any investor to make the following investments: any investment in an organization in an amount equal to cash dividends received from that organization during the preceding 12 calendar months, and any investment that is acquired from an affiliate at net asset value or though a contribution of shares.

3550.0.7 INVESTMENT INELIGIBLE FOR GENERAL CONSENT

An investment in a foreign bank is ineligible for general consent if (1) after the investment, the foreign bank would be an affiliate of a member bank, and (2) the foreign bank is located in a country in which the member bank and its affiliates have no existing banking presence.

3550.0.8 INVESTMENTS MADE WITH PRIOR NOTICE TO OR THE SPECIFIC CONSENT OF THE BOARD

An investment that does not qualify for general consent under section 211.9(b), (c), or (d) of Regulation K may be made after the investor has provided the Board with 30 days' prior written notice. The notice period commences at the time the notice is received. However—

1. the Board may waive the 30-day period if it finds the full period is not required for consideration of the proposed investment, or that the circumstances presented require immediate action, and
2. the Board may suspend the 30-day period or act on the investment under its specific-consent procedures.

Any investment that does not qualify for either the general-consent or the prior-notice procedure cannot be consummated without the specific consent (that is, express approval) of the Board.

3550.0.9 EXAMINATION OF FOREIGN SUBSIDIARIES OF BHCs

The procedures involved in examining foreign subsidiaries of domestic bank holding companies are generally the same as those used in examining domestic subsidiaries engaged in similar activities. The on-site examination of foreign subsidiaries is, however, necessarily limited. In most cases, examiners should try to implement asset-appraisal procedures by using records at the location of the U.S. parent or bank. Overseas examinations are intended primarily to appraise the firm's internal-control systems and the sufficiency of the firm's reporting to its parent company. For examination objectives and procedures for foreign subsidiaries, see the instructions for similar section 4(c)(8) investments in other sections of this manual.

3550.0.10 INVESTMENTS BY BANK HOLDING COMPANIES, EDGE CORPORATIONS, AND MEMBER BANKS IN FOREIGN COMPANIES

Subject to the limitations within subpart A of Regulation K, the Board allows, with its specific consent, banking organizations to acquire and hold investments in foreign companies that do business in the United States subject to the following conditions:

1. The activities abroad, whether conducted directly or indirectly, must be confined to activities of a banking or financial nature and those that are necessary to carry out such activities. When engaging in these activities, the investors are to act in accordance with high standards of banking and financial prudence, having due regard for diversification of risks, suitable liquidity, and adequacy of capital.
2. The activities are either those that the Board has determined to be usual in connection with the transaction of banking or other financial operations abroad as listed in section 211.10 of Regulation K, including those activities authorized with the Board's specific approval, and those that have been determined to be usual in connection with the transaction of the business of banking or other financial operations abroad, consistent with the Federal Reserve Act or the BHC Act.

2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

In 1982 the Bank Holding Company Act of 1956 was amended by the Bank Export Services Act (BESA). The Bank Export Services Act provided an exemption to the prohibitions of Section 4 of the BHC Act for a bank holding company's investment in the shares of any company that is an export trading company. The (BESA) was designed to increase U.S. exports by encouraging investments and participation in export trading companies by bank holding companies and the specified investors.

An export trading company is a company that is exclusively engaged in activities related to international trade and, by engaging in one or more export trade services:

1. derives at least one-third of its revenues in each consecutive four-year period (excluding a two-year start up period) from the export of goods and services produced in the United States by persons other than the export trading company or its subsidiaries; and
2. derives revenues from the export, or facilitating the export, of goods or services produced in the United States and those revenues exceed revenues from the import, or facilitating the import into the United States, of goods or services produced outside the United States.

A bank holding company's direct and indirect investment in export trading companies may not exceed 5 percent of the bank holding company's consolidated capital and surplus. The total amount of extensions of credit by a bank holding company and its subsidiaries to its affiliated export trading company may not exceed 10 percent of the bank holding company's consolidated capital and surplus.

A bank holding company may not invest in an export trading company, unless the Board has been given sixty days prior written notice of the proposed investment. The Board may disapprove any proposed investment only if:

1. Such disapproval is necessary to prevent unsafe or unsound banking practices, undue concentration of resources, decreased or unfair competition, or conflicts of interest; or
2. It finds that such investment would affect the financial or managerial resources of a bank holding company to an extent that is likely to have a materially adverse effect on the safety and soundness of any subsidiary bank of such bank holding company; or
3. The bank holding company fails to furnish the information required by the Board.

An Edge Act or agreement corporation that is a subsidiary of a bank holding company may invest directly or indirectly in the aggregate up to 5 percent (25 percent in the case of a corporation not engaged in banking) of the voting stock or other evidences of ownership in one or more export trading companies.

Sections 23A and 23B of the Federal Reserve Act applies to transactions between an export trading company and its affiliated banks. Regulation K, however, grants relief from section 23A's collateral requirements where a bank issues a letter of credit or advances funds to an affiliated export trading company solely to finance the purchase of goods for which: (1) the export trading company has a bona fide contract for the subsequent sale of the goods; and (2) the bank has a security interest in the goods or in the proceeds from their sale at least equal in value to the letter of credit or the advance. All other ''covered transactions'' between a bank and an affiliated export trading company should conform to sections 23A and 23B of the Federal Reserve Act.

3560.0.1 INSPECTION PROCEDURES

Export Trading Companies are generally subsidiaries of bank holding companies. Regulations applicable to them are contained in Section 211.31–4 of Regulation K. Inspections of Export Trading Companies will usually be conducted by international examiners or examiners having specialized training. Examiners conducting inspections of Export Trading Companies should be familiar with these sections as well as Section 4(c)(14) of the BHC Act.

There is no standardized inspection report form for inspections of Export Trading Companies. However, as a minimum, the report is to include the following items:

Page	*Description*
—	Cover Name of organization Location Name of parent Location of parent Date inspection commenced Date of financial statements
i	Table of Contents Same information as cover
1	Examiner's comments Scope of inspection Summary of condition Violations Operating results Adequacy of accounting records, internal controls, and audit
2	Comparative balance sheets
3	Comparative income statements
4	Classified Assets
	CONFIDENTIAL
A	Officers[1]
B	Directors[1]
C	Confidential comments Assessment of management

1. Same information in tabular form as in Edge report.

Inspection procedures should follow the Export Trading Company Questionnaire, illustrated herein. The questionnaire will be part of a special inspection report, prepared separately, or in conjunction with, a holding company inspection.

A copy of the Export Trading Company report as well as a copy of the Export Trading Company Questionnaire will be retained and included in the workpapers for the BHC inspection. Significant findings will be incorporated into the "Examiner's Comments" page, or the Analysis of Financial Factors page, when appropriate.

3560.0.1.1 Export Trading Company Questionnaire

	Yes	*No*	*NA*	*Comments*
1. Is the Bank Holding Company (BHC) or banking Edge Corporation investment in the Export Trading Company (ETC) limited to 5% of its consolidated capital and surplus? Reference: BESA, Section 203; BHC Act, Section 4(c); Regulation K, Section 211.33(a)		( )		
2. Is the investment in the ETC by an Edge Corporation not engaged in banking limited to 25% of its consolidated capital and surplus? Reference: Same as question 1.		( )		
3. Did the BHC or Edge Corporation furnish the Federal Reserve Board through the local FRB written notice of its proposed investment in the ETC at least 60 days prior to its investment in the ETC? Reference: BESA, Section 203; BHC Act, Section 4(c); Regulation K, Section 211.34		( )		
4. Do the direct and indirect outstanding credit extensions to the ETC by the investor and its subsidiaries exceed 10% of the investor's consolidated capital and surplus? Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(B); Regulation K, Section 211.33(b)	( )			
5. If the BHC or its subsidiary has extended credit to an affiliated ETC or to any of the ETC's customers:				
a. are the terms of the credit any more favorable than those afforded to similar borrowers in similar circumstances;	( )			
b. does the credit involve more than normal risk of repayment; and	( )			
c. does the credit present any unfavorable features? Reference: Regulation K, Section 211.33(b)(2)	( )			
6. If the BHC or its subsidiary has extended credit to another investor with at least 10% interest in the ETC, or to an affiliate of the investor:				
a. are the terms of the credit any more favorable than those afforded to similar borrowers in similar circumstances;	( )			

	Yes	*No*	*NA*	*Comments*
b. does the credit involve more than normal risk of repayment; and,	( )			
c. does the credit present any unfavorable features?	( )			
Reference: Same as question 5.				
7. Do covered transactions (under Sections 23A and 23B of the Federal Reserve Act) between a bank and an affiliated ETC meet the collateral requirements of Section 23A unless exempted because the bank has extended a letter of credit or advance to the affiliated ETC solely for the purchase of goods for which:		( )		
a. the ETC has a bona fide sales contract; and				
b. the bank has a security interest in the goods, or in the proceeds from their sale at least equal in value to the letter of credit or advance?				
Reference: Regulation K, Section 211.33(b)(3)				
8. Has the ETC received an export trade Certificate of Review which exempts it from antitrust laws?		( )		
Reference: BESA, Section 301				
9. Has the ETC Certificate holder submitted an annual report to the Secretary of Commerce as required?		( )		
Reference: BESA, Section 308				
10. Is the ETC exclusively engaged in activities related to international trade?		( )		
Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(F) Regulation K, Section 211.32(a)				
11. Is the ETC operated principally for the purposes of exporting goods or services produced in the U.S., or for purposes of facilitating the exportation of goods or services produced in the U.S. by unaffiliated persons by providing one or more export trade services?		( )		

	Yes	*No*	*NA*	*Comments*
The term ‘‘export trade services’’ includes, but is not limited to, consulting, international market research, advertising, marketing, insurance other than acting as principal, agent or broker in the sale of insurance on risks resident or located, or activities performed, in the United States, except for insurance covering transportation of cargo from any point of origin in the U.S. to point of origin in the U.S. to a point of final destination outside the U.S., product research and design, legal assistance, transportation, including trade documentation and freight forwarding, communication and processing of foreign orders to and for exporters and foreign purchasers, warehousing, foreign exchange, financing, and taking title to goods in order to facilitate U.S. exports. An ETC may engage in importing, barter, and third-party trades only if these activities further U.S. exports and only if the preponderance of ETC activities do not involve importing and the revenues from export activities exceed revenues from import activities. Reference: Same as question 10.				
12. If the ETC has expanded its activities significantly beyond those in the original notice to the Board, such as to taking title to goods, product research and design, product modification, or activities not specifically covered in the BHC Act, has the investor given a 60 day notice in advance to the Board? Reference: Regulation K, Section 211.34		( )		
13. If the ETC has been in operation more than six years, is more than one-third of the ETC’s revenue in the last consecutive four-year period derived from exports or facilitating exports of U.S. goods and services produced in the U.S. by persons other than the ETC or its subsidiaries? Revenue includes net sales revenue from the trading of goods by the ETC for its own account and gross revenue from all other activities of the ETC. Reference: Regulation K, Section 211.32(a)		( )		

	Yes	*No*	*NA*	*Comments*
14. Does the ETC engage in agricultural production, manufacturing or product modification of goods, e.g., repackaging, reassembly, or extracting by-products other than incidental product modification as necessary to conform to the requirements of foreign countries for sale of the goods in the foreign countries? Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(c) Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(c)	( )			
15. Does the ETC take title to goods for which it has received no firm purchase order or commitment? Reference: BESA, Section 103(a)(3)	( )			
16. What period of time do the goods on which the ETC has taken title remain in the inventory of the ETC?				
Does this activity appear unduly speculative? Reference: Same as question 15.	( )			
17. Do the nature and terms of sale of goods retained by the ETC appear to be in line with proper ETC business operations, i.e., not unduly speculative and related to authorized activities? Reference: Same as question 15.		( )		
18. If the ETC acts as a principal, agent, or broker in the sale of insurance, does such activity exclude the sale of insurance on risks or activities located or performed in the U.S. Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(F)		( )		
19. If the ETC engages in, or holds shares of a company engaged in underwriting, selling or distributing securities in the U.S., are such activities limited to the same extent as for BHC's under applicable Federal and State banking laws and regulations? Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(C), 12 USC, Section 1843(c)(14)(C)(i)		( )		

	Yes	No	NA	Comments
20. Does the ETC take positions in commodities, commodity contracts, securities or foreign exchange other than as may be necessary in the course of the ETC's authorized business transactions? Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(D)	( )			
21. Are activities of the ETC Certificate holder in compliance with the Certificate of Review? (If not, the ETC could be subject to antitrust laws.) Reference: BESA, Section 306		( )		
22. Does the ETC capital base appear to adequately support the strength of the ETC and its ability to withstand unexpected adverse developments so as not to affect the financial resources of the parent or the safety and soundness of affiliated banks? Reference: 43 *Federal Register,* 26,448(1983).		( )		
23. Is there any evidence of adverse effect of the investment in the ETC on the investment in the ETC on the financial or managerial resources of the BHC or Edge Corporation investor, or on the safety and soundness of any subsidiary bank of a BHC investor? Reference: BESA, Section 203; BHC Act, Section 4(c)(14)(A)(iv)(11)	( )			
24. Has the ETC's capital to asset ratio remained at all times at or above the minimum established in the original notice to the Board?		( )		
25. Is the ETC in compliance with operational policies, including maximum financial leverage per transaction, as established in the original notice to the Board?		( )		

( ) = Exception

Export Trading Company

_______________________________ Date: _______________________
Bank Holding Company Investor

____
Examination Date

As a general rule, a bank holding company must provide 60 days' prior written notice to its Reserve Bank to engage in any nonbanking activity, or to acquire or retain the shares of a company engaged in an activity based on section 4(c)(8) or 4(a)(2). When a bank holding company gives notice to a Reserve Bank for approval to engage in, or retain or acquire shares in a company engaged in, a nonbank activity, the BHC must be of the opinion that the activity is closely related to banking and, assuming this test is met, that the activitiy is a proper incident thereto. In addition, a BHC that also is an FHC must provide 60 days' prior written notice to its Reserve Bank to engage in an activity that is complementary to a financial activity under section 4(k)(1)(B). In considering such a notice, the Board must determine whether performance of the activity can reasonably be expected to produce benefits to the public, such as greater convenience, increased competition, or gains in efficiency, that outweigh possible adverse effects, such as undue concentration of resources, decreased or unfair competition, conflicts of interest, or unsound banking practices.

As an exception to the general rule, no prior notice is required for a bank holding company that is qualified under section 4(j)(4) of the BHC Act to engage de novo, directly or through a subsidiary, in an activity that the Board permitted under section 225.28 of Regulation Y before November 12, 1999. After passage of the Gramm-Leach-Bliley Act of 1999, this list of activities cannot be expanded. For all bank holding companies that are not qualified under section 4(j)(4), for all other nonbanking activities based on section 4(c)(8) or section 4(a)(2), and for all activities that are complementary to a financial activity under section 4(k)(1)(B), the bank holding company must provide the appropriate prior written notice of its proposal to its Reserve Bank.[1] The Board must review the notice without disapproving it each time the bank holding company wishes to engage in a proposed activity. The inspection objective and procedures set forth below can be implemented for each of the activities summarized in subsequent sections.

3600.0.1 INSPECTION OBJECTIVE

1. To determine what financial effect nonbanking activities have on the parent and the bank subsidiaries, and if there is any degree of exposure in the activities because of a lack of appropriate audit systems and controls.

3600.0.2 INSPECTION PROCEDURES

1. Review the company's financial statements for accuracy and determine if any factors or trends could have an adverse impact on the parent holding company or the bank subsidiaries.
2. Review the adequacy of the company's policies, procedures, practices, internal controls, and audit coverage regarding nonbanking activities, and whether they are adhered to.

1. A bank holding company that is qualified under section 4(j)(4) of the BHC Act may provide 12 calendar days' prior written notice before engaging by acquisition in an activity permitted under section 225.28 or engaging in an activity based on section 4(c)(8) and approved by the Board by order.

Two bank holding companies (Company A) and (Company B) had requested the Board to determine whether their planned nonbank subsidiary activities were of the kind described in Section 4(c)(8) of the BHC Act. The applications had been filed prior to the passage of the Bank Holding Company Act Amendments of 1970. The applicants proposed to expand their activities under a ‘‘pool reserve plan’’ to include correspondent banks. Such activities were limited to subsidiary banks.

The ‘‘pool reserve plan’’ was described as a method of pooling of loss reserves with respect to term loans to small businesses and the establishment of uniform credit standards in that regard. The ‘‘pool reserve plan’’ permitted banks to adopt a uniform and liberal credit policy in extending credit and the usual method of exchanging participations between the banks.

The General Counsel of the Board of Governors determined, on October 14, 1971, pursuant to delegated authority, that the proposed activities would be ‘‘so closely related to banking or managing or controlling banks as to be a proper incident thereto’’ in accordance with Section 4(c)(8) of the BHC Act, as amended by the BHC Act Amendments of 1970. The approval (1971 FRB 1037) included the following conditions that:

1. The subsidiary was to amend its charter so that the charter would authorize it to perform its functions, and make its services available to banks, but not to lenders other than banks, and to amend its proposed contracts with correspondent banks;
2. Any correspondent banks could terminate their contract with the subsidiary respecting future transactions upon 90-day prior written notice, and that;
3. The subsidiary be subject to the same limitations with the respect to the ownership of any collateral acquired in the course of the conduct of its proposed activities as were its parents, (Company A and Company B).

3600.5.1 NEW YORK INVESTMENT COMPANY

On May 10, 1977, the Board approved an application of a foreign-owned domestic bank to form a holding company, and, at the same time, for that holding company to acquire substantially all of the voting shares of an investment company organized and operating under article XII of the New York State Banking Law (a New York investment company).

The investment company at that time was engaged in providing lending and international banking services, including letters of credit, acceptances, and other financing facilities in connection with exports and imports, international transfers of funds, and foreign-exchange services; investments and foreign-exchange transactions for its own account; leasing improved real estate and data processing equipment; and maintenance of credit balances incidental to or related to the foregoing activities. Although the holding company believed that certain of the activities of the New York investment company had already been determined by the Board to be permissible for bank holding companies, it requested approval of its application on the basis that *all* the activities that a New York investment company is permitted to engage in under New York law are closely related to banking. A New York investment company had not previously been determined by the Board to be an activity permissible for bank holding companies.

The Board noted that the structural and competitive circumstances under which a New York investment company operates are unique to New York and have served in the past as a means for foreign-bank entry into New York in cases where entry through a direct branch or agency was either unavailable or undesirable for the purposes sought. Most of the lending and banking services offered by these companies are also offered by commercial banks generally and, in this connection, compete with foreign banking organizations and domestic commercial banks and their Edge corporation subsidiaries. However, under article XII of the New York State Banking Law, a New York investment company is permitted to engage in various other activities which the Board does not consider to be closely related to banking.

Based on the foregoing, the Board's approval in this case was limited to and contingent upon the New York investment company's (1) continuing to engage principally in transactions involving international or foreign commerce, and not accept demand deposits; (2) complying with all Board or legislatively imposed reserve and interest-rate requirements; (3) divesting of offices in another state within two years; (4) confining activities of its foreign branch to those permitted in the Board's order; and (5) not engaging in the activities of underwriting, selling, or distributing securities; buying or selling coin and bullion; or acting as a financial agent of the U.S. government or as a depositary of public moneys of the United States, or in any new activity which New York investment companies by subsequent enactment may be permitted to engage in, without the prior approval of the Board. (See 1977 FRB 595.)

3600.5.2 ENGAGING IN BANKING ACTIVITIES THROUGH FOREIGN BRANCHES OF A NONBANK COMPANY

A bank holding company applied for the Board's approval to retain direct or indirect ownership of a subsidiary, "CBC," a Delaware-chartered corporation, after it established branches in Nassau and Luxembourg, to engage in certain commercial banking activities. The activities included accepting funds in U.S. dollars or foreign currency in wholesale money markets in amounts over $100,000, making commercial loans in amounts over $100,000, placing funds with and making loans and advances to subsidiary and affiliated organizations, engaging in foreign-exchange transactions, and other activities constituting commercial banking outside the United States. CBC held the shares of a number of nonbanking subsidiaries of the BHC pursuant to section 4(c)(1)(C) of the BHC Act, which permits a subsidiary of a bank holding company to perform services for its parent company.

The purpose of the proposal was to provide the BHC with increased flexibility in funding its domestic operations by allowing CBC to gain access to the offshore wholesale money market. The proposed foreign branches of CBC, by obtaining banking licenses, would give direct access to Eurocurrency interbank markets, and the activities of the proposed branches were expected to be viewed as an integral part of a large U.S.–headquartered entity, making the branches competitive in the offshore interbank markets.

The Board decided that the lending and banking services that the proposed branches would offer were generally offered by commercial banks, and thus are permissible activities of foreign branches of domestic banks and foreign subsidiaries of bank holding companies. The proposed activities of CBC's branches were substantially similar to activities that the Board had previously approved under section 4(c)(8) of the BHC Act for the foreign branches of the New York investment company, incorporated under article XII of the New York Banking Law (see 1977 FRB 595 and 1979 FRB 667). CBC did not propose to engage in any activity that would not be permitted for a separately incorporated foreign subsidiary of a bank holding company. The Board, therefore, ruled that the proposed activities of CBC were closely related to banking (1982 FRB 251).

CBC proposed to engage in no banking activities in the United States, stating that its only U.S. activities would consist of its indirect nonbanking activities through subsidiaries. The subsidiaries would be funded through funds raised by the proposed foreign branches. In this connection, the BHC committed to accepting no placement of or deposits from,[1] or extending no credit to (other than a subsidiary or affiliated organization) a United States resident.[2] The BHC committed that the liabilities to CBC of any person, other than an affiliate, would not exceed 10 percent of the capital and surplus of CBC. The Board felt that these prudential conditions were adequate to meet any supervisory concerns to which the proposal might give rise and thus approved the application, subject to the obtaining of the necessary licensing requirements of the countries involved.

1. A placement or deposit received from a foreign branch, office, subsidiary, affiliate, or other foreign establishment (''foreign affiliate'') controlled by one or more domestic corporations is not regarded as a placement or deposit received from a U.S. resident if such funds are used in its foreign branches or that of other foreign affiliates of the controlling domestic corporation(s).

2. Credit extended to a foreign affiliate, controlled by one or more domestic corporations, is not regarded as credit extended to a U.S. resident if the proceeds will be used in its foreign business or that of other foreign affiliates of the controlling domestic corporation(s).

A domestic bank holding company (the BHC) and a foreign banking organization (the FBO), subject to the BHC Act, applied for the Board's permission to engage in operating a securities exchange under the authority of section 4(c)(8) of the BHC Act and section 225.24 of Regulation Y. The BHC proposed to control approximately 17 percent of the voting shares of group (the group), and the FBO planned to control approximately another 11 percent of the voting shares of the group. The group owned about 54.1 percent of a financial network subsidiary (FNS), which operated an electronic securities exchange (the exchange) for the secondary trading of equity and equity-related securities listed on the London Stock Exchange (LSE). The BHC and FBO indicated that the group planned to establish an office in the United States. In anticipation of the establishment of this office, the BHC and FBO requested the Board's approval to acquire their interests in the group. A BHC must obtain the Board's approval if a foreign company held by the BHC seeks to engage in business in the United States.

The exchange is a screen-based electronic market that provides securities trade matching, trade execution, and related services to U.S. and foreign market makers, broker-dealers, and institutional investors that become members of the exchange. Members may access the exchange and enter bid and ask quotations using electronic terminals that are linked to designated financial networks (for example, a Bloomberg terminal) or through a personal computer linked directly to the exchange. The exchange can be accessed from terminals located anywhere in the world. Trading, however, may occur only during the operating hours of the LSE. Orders entered in the exchange's system appear on separate electronic order books for each security, which display the best bid and ask quotes for the security in descending order. The exchange automatically and continuously matches equal bid and ask offers for each listed security on a first-come, first-served basis.

FNS does not take a principal position in securities, clear or settle the securities transactions executed on the exchange, or assume any principal risk for securities trades executed on the exchange. FNS and its shareholders are not obligated to guarantee any member's trades. Each member of the exchange must be a member of the London Clearing House, or must appoint a member of the London Clearing House to clear the member's trades on the exchange. Trades matched by the exchange are registered at the end of each business day with the London Clearing House in the name of the appropriate clearing member. London Clearing House then becomes the counterparty to each side of the trade until the trade is settled. The trade is settled through a designated system operated by a corporation established by the Bank of England to settle uncertificated U.K. equities.

The exchange is a recognized investment exchange under section 37(3) of the U.K. Financial Services Act of 1986, and is regulated and supervised by the U.K. Financial Services Authority (FSA), under the securities laws of the United Kingdom. While FNS makes its services available to customers in the United States, the SEC has granted it a limited volume exception from the registration requirements of the Securities Exchange Act of 1934. The SEC exemptive order permits FNS to operate in the United States without registering as a securities exchange provided (1) the exchange's average daily volume of trades involving U.S. members does not exceed $40 million, and (2) the exchange's worldwide average daily volume does not exceed 10 percent of the average daily trading volume on the LSE. The SEC exemptive order requires the exchange to comply with other conditions that are designed to ensure orderly and fair markets and to protect U.S. investors.

The Board had not previously determined by regulation or order that the operation of a securities exchange is closely related to banking within the meaning of section 4(c)(8) of the BHC Act. The principal function of a securities exchange is to provide a centralized facility for the execution, clearance, and settlement of securities transactions. The Board indicated in its order that banks and BHCs are authorized to provide securities brokerage services to their customers and, as part of those services, to execute and clear such transactions on a securities exchange. The Board also noted that BHC subsidiaries authorized to act as dealers in securities (section 20 subsidiaries) may provide securities execution, clearance, and settlement services in connection with their dealer operations. In addition, the Board noted that broker or dealer subsidiaries of banks and BHCs often become members of securities exchanges and thus acquire a small ownership (less than 5 percent) in a mutually owned exchange (for example, the New York Stock Exchange). Through the development of these relationships, banks and BHCs have gained considerable experience with and knowledge of the rules and operations of securities exchanges.

Banks and BHCs also provide services that are functionally and operationally similar to those of the exchange. Banks and BHC subsidiaries acting as securities brokers may execute cross-trades for their customers and thereby match equal bid and offer orders received from them. In addition, section 20 subsidiaries may, if authorized, act as a specialist or market maker on a securities exchange such as the NYSE or NASDAQ. A specialist generally maintains a book of current buy and sell orders received from other brokers and matches equal bid and offer quotes for execution. Market makers on NASDAQ also publish bid and ask prices at which they stand ready to execute transactions in the relevant security.

For the above reasons, and based on all the facts on record, the Board concluded that operating a securities exchange is an activity that is closely related to banking for the purposes of section 4(c)(8) of the BHC Act. The application was approved on November 8, 1999. See 2000 FRB 61 for the order and more specific information regarding the Board's approval.

A foreign banking organization (FBO)[1] subject to the BHC Act and several bank holding companies (BHCs), deemed to be BHCs (all referred to as the notificants) within the meaning of the BHC Act, requested the Board's approval under section 4(c)(8) of the BHC Act and section 225.24 of the Board's Regulation Y (12 C.F.R. 225.24) to retain 12.5 percent of the voting interests in Indent Company (Indent), and to engage through Indent and other nonbank subsidiaries in acting as a certification authority (CA) in the United States in connection with financial and nonfinancial transactions and other related activities. Indent represents a joint venture among the notificants and other commercial banks and foreign banking organizations. As proposed, Indent would act as the global rule-making and coordinating body for a network of financial institutions that would act as CAs and thereby provide services designed to verify or authenticate the identity of customers conducting financial and nonfinancial transactions over the Internet and other ''open'' electronic networks. To provide these services, Indent and its network of participating financial institutions (the identity system) would use digital certificates and digital signatures created through the use of public-key cryptography.

In a CA system using public-key cryptography, a company generates (or is assigned) a public-key/private-key pair and registers with a CA as the unique ''owner'' of the key pair.[2] Private keys and public keys are a set of different but related mathematical functions that can be used to encrypt and decrypt electronic communications. A message encrypted by a particular private key can be decrypted only by its corresponding public key. Although a private key and its corresponding public key are related, a private key cannot feasibly be derived from its corresponding public key. Thus, while a private key must be kept confidential by the company that is the registered owner of the key pair, the company's public key can be made publicly available without jeopardizing the confidentiality of the company's private key.

A company sending a business communication (for example, a purchase order) to another entity over an open electronic network like the Internet uses its confidential private key to digitally sign the message being sent. A digital signature is a compressed and encrypted version of the message to which it is attached. The entity receiving the digitally signed message then uses the sender's public key to decrypt the digital signature.[3] If the receiver successfully decodes the signature with the sender's public key, the receiver can be assured that the message was created using the sender's private key.[4]

To be assured that the message was actually sent by the purported sender, however, the receiver must confirm that the private-key/public-key pair used to sign and decode the message is uniquely ''owned'' by the purported sender. A CA provides this assurance by issuing ''digital certificates'' certifying that the relevant private-key/public-key pair is uniquely associated with the message sender and by verifying upon request the validity of such digital certificates.

The notificants and other financial institutions participating in the identity system (participants)[5] would create unique private-key/public-key pairs for, and issue digital certificates on behalf of, eligible customers that contract with one of the participants to receive Indent identity-authentication services.[6] Each participant would

1. Foreign banks may engage in permissible nonbanking activities in the United States directly through a U.S. branch or agency. A foreign bank, however, must receive the Board's approval under section 4(c)(8) of the BHC Act to engage in the United States in activities that are deemed to be closely related to banking.

2. A number of nonbanking companies currently operate CA systems that rely on public-key cryptography to provide identity-authentication services to senders and receivers of electronic communications.

3. The sender's public key may be attached to the digitally signed communication, or the receiver of the message may obtain the sender's public key from a publicly available database.

4. The receiver also can confirm that the message was not altered after it was signed by comparing the message received with the decrypted version of the message text embedded in the digital signature.

5. Participation in the identity system is available only to organizations that are engaged primarily in the business of providing financial services; are subject to regulation and examination by a government authority in their home country; and that meet certain eligibility criteria, such as minimum capital requirements and debt-rating criteria. A participant also must agree to be bound by the identity system operating rules and to execute certain participation agreements. Financial institutions would not be required to purchase an ownership interest in Indent to become a participant.

6. The participants may provide identity system–related services only to customers that have agreed to be bound by applicable provisions of Indent's operating rules and have signed the appropriate customer agreements. Indent's operating rules allow the participants to provide identity system–related services only to business entities, such as corporations and governmental organizations, and not to natural persons. Indent's operating rules and customer agreements would make each customer contractually responsible for ensuring that its private key is kept confidential.

act as a repository for the digital certificates that it has issued, that is, it would maintain a database containing information on the status of the outstanding, expired, or revoked digital certificates that it has issued to customers. The participants also would verify for third parties the validity of digital certificates issued to their customers and, upon request of the third party, may provide an explicit warranty as to the validity of the customers' digital certificates.[7] The participants also may process and transmit verification and warranty requests received from customers concerning digital certificates issued by other participants in the identity system. In addition, the participants may provide customers with a limited range of software and hardware that is required for customers to use the identity system.[8]

Indent would provide the infrastructure framework within which the participants would act as CAs and provide related services. The primary function of Indent would be to act as the "root certification authority" of the identity system, that is, issuing digital certificates to the participants that establish their status as CAs in the identity system and authenticating for customers of, and the other participants in, the identity system the identity of the participants.[9] Indent also would (1) establish and maintain the operating rules governing the identity system, including the minimum technical requirements for digital certificates and other components of the system; (2) monitor compliance by the participants with the identity system's operating rules and technical standards; and (3) monitor collateral requirements and aggregate warranty exposure for the participants in the identity system.[10]

Section 4(c)(8) of the BHC Act provides that a bank holding company may, with the Board's approval, engage in any activity that the Board determines to be closely related to banking. The Board previously has authorized BHCs under section 4(c)(8) of the BHC Act to act as CAs and provide identity-authentication services in connection with payment-related and other financial transactions conducted over electronic networks.[11] The Board has not previously authorized BHCs under section 4(c)(8) to act as CAs or provide identity-authentication services in connection with nonfinancial transactions.

Banks and BHCs have long provided identity-authentication services in connection with nonfinancial transactions conducted by third parties and for their own traditional banking and lending activities. For example, banks and BHCs are authorized to provide notary services to customers.[12] The role of a notary is to authenticate signatures on financial or nonfinancial documents for the benefit of third parties.[13] To verify a signature on a paper-based document, a notary must verify the identity of the person signing the document. The Board noted that the role a CA serves with respect to electronic documents is functionally similar to the role a notary serves with respect to paper-based documents.[14]

Banks have traditionally identified their customers to third parties through the issuance of letters of introduction or letters of reference.[15] In addition, banks and BHCs routinely authenticate the identity of customers and noncustomers in connection with their authorized check-cashing functions.[16]

7. The operating rules of the identity system would provide that a company relying on a digital certificate issued by the participant would have recourse against the participant only if the company purchased an explicit warranty from the participant, and then only up to the amount of the purchased warranty. The participant that issues a digital certificate could refuse to issue a warranty for a digital certificate for any bona fide reason. The identity system would limit the aggregate amount of warranties that the participant may have outstanding at any one time, and would require each participant to post collateral with Indent to cover its warranty exposure.

8. For example, the participants may provide smart cards containing digital certificates and smart-card readers to their customers.

9. Digital certificates issued by the participant to a customer are digitally signed by the participant with its own private key and are accompanied by a digital certificate issued by Indent. The digital certificates Indent issues would certify that the participant is an authorized participant in the identity system and that the private key the participant uses to digitally sign its certificates is uniquely associated with it, thereby authenticating the identity of the participant.

10. The activities of the notificants and Indent would be limited to providing the identity-authentication and related services described above. The notificants and Indent would not provide a general encryption or electronic message service, or any warranty of the underlying financial or nonfinancial transactions between customers whose identities are authenticated through the use of the identity system.

11. See Regulation Y, section 225.28(b)(14); 1997 FRB 602, 606; and 1982 FRB 505, 510.

12. See 1998 FRB 481.

13. 58 Am. Jur. 2d *Notaries Public* § 31 (2d ed. 1989).

14. The American Bar Association, for example, has noted that the issuance of digital certificates by CAs is "analogous to traditional certification processes undertaken by notaries with respect to documents executed with pen and ink." "Digital Signature Guidelines," published by the Information Security Committee of the Electronic Commerce and Information Technology Division, Section of Science and Technology, American Bar Association. (Aug. 1, 1996), p. 54.

15. Banks have drafted letters of introduction or letters of reference on behalf of their customers for the purpose of introducing the customer to other banks or third parties with which the customer seeks to do business.

16. Under the Uniform Commercial Code (UCC), a bank that accepts a check for deposit warrants to the drawee bank

Banks and BHCs also have long been authorized to issue signature guarantees to issuers of securities and their transfer agents in connection with the transfer of securities.[17] A bank issuing a signature guarantee warrants that the customer's signature endorsing a certificated security or authorizing the transfer of an uncertificated security is authentic. The issuing bank also warrants that the signer was an appropriate person to endorse the security or authorization (or, if the signature is by an agent, that the agent had actual authority to act on behalf of the appropriate person) and that the signer had legal capacity to sign. In light of these warranties, a bank providing a signature guarantee must verify the identity of the customer providing the endorsement or signing the instruction.[18]

Identity-authentication services are an integral part of many traditional banking functions. Banks and BHCs have developed sophisticated methods for authenticating the identity of customers and noncustomers that transact business or communicate with the bank or BHC through electronic means or otherwise. Many of these activities are operationally and functionally similar to the proposed activities, and make banks and BHCs particularly well equipped to provide the proposed services. For example, banks and BHCs maintain systems to electronically authenticate the identity of persons engaged in credit and debit card, automated teller machine (ATM), home banking, and wire transfer transactions with the institution.[19] Banks and BHCs also electronically authenticate the identity of persons in connection with the check and credit card verification services they are authorized to provide to merchants and other businesses.[20]

The Board noted that state banks and national banks have recently been authorized to act as CAs and to provide identity-authentication services in connection with financial and nonfinancial transactions conducted over electronic networks. Based on the foregoing, the Board concludes that acting as a CA and, more generally, authenticating the identity of customers conducting financial and nonfinancial transactions are activities that are closely related to banking within the meaning of section 4(c)(8) of the BHC Act.

Indent and the notificants also propose to engage in a number of activities as part of and in connection with their proposed CA activities. These activities include (1) processing, transmitting, and storing data necessary for the operation of the identity system, such as digital certificates, requests for verification of digital certificates, and warranty requests; (2) developing and marketing software and hardware necessary for operating the identity system; and (3) complying with, monitoring, and enforcing the collateral-posting requirements associated with identity warranties. In addition, Indent would establish operating policies, procedures, and guidelines for the identity system.

The Board's Regulation Y permits BHCs to provide data processing and data transmission services and facilities (including software and hardware) for the processing and transmission of financial, banking, or economic data, and to engage in activities related to making, acquiring, brokering, or servicing extensions of credit, such as posting collateral and monitoring collateral requirements.[21] Regulation Y also permits BHCs to engage in incidental activities that are necessary to the conduct of an activity that is closely related to banking. Indent and the notificants have represented that they would engage in the additional activities only in connection with their CA activities and would not engage in such activities separate or apart from their CA activities. The notificants also have committed that the data processing and data transmission activities of the notificants and Indent, including any proposed development or sale of hardware and software, will comply with the Board's regulations and interpretations. In light of the nature of these additional activities and the fact that they would be conducted only in connection with the CA activities of Indent and the notificants, and all the other facts of record, the Board concludes that these activities are encompassed within the activities previously approved by the Board by regulation or are incidental to

that all endorsements on the check are genuine, and the bank is liable to the drawee bank for the amount of the check plus expenses and lost interest if an endorsement on the check was forged.

17. Broker-dealer subsidiaries of BHCs also have provided signature guarantees.

18. A bank issuing a signature guarantee is liable to the issuer of the security or its transfer agent for any loss that results from a breach of any of these warranties by the bank.

19. Article 4A of the UCC encourages banks to develop and maintain commercially reasonable security procedures, such as algorithms or other encryption devices, for authenticating the identity of customers that transmit wire transfer instructions to the bank.

20. See Regulation Y, section 225.28(b)(2)(iii) and 1985 FRB 648.

21. See Regulation Y, section 225.28(b)(2) and (14). A BHC may develop and sell hardware and software that is designed and marketed for processing and transmitting financial, banking, or economic data. It may also develop and sell general purpose hardware so long as it does not constitute more than 30 percent of the cost of any packaged offering.

the permissible CA activities of Indent and the notificants and, therefore, are permissible under Regulation Y.[22]

Based on the facts stated in the Board's order, the Board determined that the certification authority and other activities discussed were closely related to banking under section 4(c)(8) of the BHC Act. The Board issued its approval order on November 10, 1999. See 2000 FRB 56. See the Board's order for more specific information and for the more detailed information and references in the order's footnotes.

22. The notificants may engage in data processing and data transmission activities, including the development and sale of hardware and software, pursuant to this order only to the extent such activities are necessary to permit the proper operation of the identity system. The notificants and Indent also must conduct their data processing and data transmission activities subject to the software and hardware limitations in Regulation Y.

A bank holding company (the applicant) applied under section 4(c)(8) of the Bank Holding Company Act and the Board's Regulation Y to engage de novo through a wholly owned subsidiary (the company) in privately placing limited partnership interests in a group of partnerships having a limited number of investors. The company was to serve as the investment adviser, administrator, and sole general partner of a series of seven partnerships (the partnerships) that would be sold to a number of institutional investors. The company would maintain an equity interest of approximately 1.25 percent of the total capitalization in each partnership.

The partnerships were to be engaged solely in investing in limited amounts of debt and equity securities, including interests in real estate investment equity trusts (REITs).[1] The partnerships, together with the applicant and its other subsidiaries, were not to hold more than 5 percent of any class of voting securities of any issuer, and not more than 25 percent of the total equity of any issuer.[2] The equity investments were to be held in accordance with section 4(c)(6) of the BHC Act and section 225.22(d)(5) of Regulation Y.

The company also proposed to privately place limited partnership interests with new sophisticated institutional investors and possibly form similar additional partnerships in the future. The company was not to privately place debt securities issued by the partnerships without prior approval from the Federal Reserve System. The applicant committed that the private placement of limited partnership interests would conform to the limitations and conditions for private placements in previous Board orders approving private-placement activities (for example, 1990 FRB 26 and 1989 FRB 829).[3] Each investor was required to have an initial minimum investment of $100,000. Investors with $250,000 or more under management by the company, however, would be permitted to invest in any partnership in any amount. The applicant would continue the company's practice of allowing existing investors in a partnership to add to their investment in the partnership in any amount. The application was approved on June 28, 1994 (1994 FRB 736).

Subsequently, another bank holding company (the BHC applicant) applied for the Board's approval under section 4(c)(8) of the BHC Act and section 225.23 of Regulation Y to engage de novo, through a wholly owned asset-management subsidiary (AMS), in establishing and serving as the general partner of limited partnerships (the limited partnerships) that would invest in a wide variety of commodities and exchange-traded and over-the-counter instruments including those specified in the Board order. AMS would be the general partner of each partnership and would hold a nominal equity interest in each one. In this case, AMS would not provide investment advice directly to the limited partnerships, but would employ unaffiliated investment advisers to manage the investments of the limited partnerships, pursuant to parameters set by AMS. Interests in the limited partnerships would be privately placed with institutional customers by the BHC applicant's subsidiary banks.

One or more of the limited partnerships could invest a substantial portion of their assets in commodity pools, which would require the applicant to register as a commodity pool operator (CPO). The interests purchased by the limited partnerships would consist of less than 5 percent of the outstanding voting securities of any commodity pool and less than 10 percent of the total equity of any commodity pool. The applicant proposed that the limited partnerships purchase such assets with debt. It further stated that it would not permit any limited partnership that invested in distressed debt instruments to use borrowed funds to purchase or carry distressed debt instruments or to use the distressed debt instruments as collateral in acquiring other assets. The applicant also indicated that the leverage employed by the limited partnerships would include margin credit from broker-dealers, reverse repurchase agreements, and short sales.

The limited partnerships would invest in debt and equity instruments and distressed debt instruments.[4] The applicant stated that invest-

1. The partnerships were not to invest in futures contracts or options on futures contracts on any financial or nonfinancial commodity, or knowingly invest in debt that, upon acquisition, is in default without the prior approval of the Federal Reserve System. The applicant further committed that it would not use the investments of the partnerships to obtain or exercise control over any issuer of securities owned or held by the partnerships. Also, no directors, officers, or employees of the applicant and its affiliates will serve as directors, officers, or employees of any issuer of which the applicant and its affiliates held more than 10 percent ownership of total equity.

2. The applicant committed that all subordinated debt of an issuer would be subject to this 25 percent limit.

3. See the current Regulation Y, section 225.28(b)(7)(iii), regarding private-placement services.

4. The Board had previously permitted bank holding com-

ments in debt and equity securities and distressed debt would be made in accordance with the BHC Act's limitations and those of previous Board decisions. (See 1995 FRB 1128 and section 3104.0.)

The limited partnerships, together with the applicant and its subsidiaries, would make investments not greater than 5 percent of any class of voting securities of any issuer, and not greater than 25 percent of the total equity, including the subordinated debt, of any issuer. No directors, officers, or employees of the applicant would serve as directors, officers, and employees of any issuer of which the applicant and its subsidiaries (that is, the limited partnerships) would hold more than 10 percent of the total equity. For this case, the Board required AMS to consolidate the assets and liabilities of the limited partnerships in the financial statements of AMS for regulatory capital purposes. In addition, AMS was required to establish an appropriate risk-management structure consisting of investment and position limits for each investment adviser before engaging in the proposed activities. Compliance and trading limits would be monitored by computerized systems to be established by the applicant. The Board approved the notice on April 24, 1996, subject to all the facts of record and the commitments furnished. See 1996 FRB 569. For more recent Board orders whereby bank holding companies propose to act as a CPO and to control a private limited partnership that invested solely in permissible investments for a bank holding company, see 1999 FRB 209, 1998 FRB 852, and 1998 FRB 361.

panies to sponsor, organize, and manage closed-end investment companies and unregistered limited partnerships that invest in securities.

3600.13.1 SERVING AS AND CONTROLLING A PRIVATE LIMITED PARTNERSHIP AS A COMMODITY POOL OPERATOR

A bank holding company applied for the Board's approval under section 4(c)(8) of the Bank Holding Company Act (BHC Act) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) to engage de novo through a wholly owned asset-management subsidiary (ASM) that would be established to serve as the general partner of limited partnerships (the partnerships) that would invest in a wide variety of commodities and exchange-traded and over-the-counter instruments, including interests in investment funds that invest in futures and options on futures on financial and nonfinancial commodities (commodity pools). It was indicated that the partnerships would not directly invest in futures or options on futures contracts for purposes other than hedging. The partnerships would purchase and sell derivative contracts on precious metals and financial commodities, instruments, and indices for hedging purposes. It was further stated that one of the limited partnerships may invest a substantial portion of its assets in commodity pools, which would require the ASM (the general partner) to become a registered commodity pool operator (CPO) with the Commodity Futures Trading Commission (CFTC). As such, the ASM would register as a CPO with the CFTC, and a portion of the general partner's activities would become subject to the recordkeeping, reporting, fiduciary standards, and other requirements of the Commodity Exchange Act (7 U.S.C. 2 et seq.), CFTC, and National Futures Association.

The Board previously has found that a subsidiary of a state member bank may serve as the CPO of investment funds engaged in purchasing and selling futures and options on futures on certain commodities.[1] In addition, the Board has permitted bank holding companies to trade futures and options on futures on financial and nonfinancial commodities.[2] For these reasons, the Board has concluded that serving as a CPO, and controlling as a CPO a private limited partnership that invests solely in investments that a bank holding company is permitted to make directly, under the circumstances of this case (1996 FRB 569) are closely related to banking. See also 1998 FRB 1075, 1998 FRB 852–854, 1998 FRB 361, and 1994 FRB 736.

1. See 1996 FRB 239.
2. See 1995 FRB 185.

3600.17.1 ENGAGING IN TITLE INSURANCE AGENCY ACTIVITIES PURSUANT TO REGULATION Y

A bank holding company applied under section 4(c)(8) of the BHC Act and section 225.23(a) of the Board's Regulation Y to acquire all the outstanding shares of a title insurance agency. The title insurance agency is to conduct activities pursuant to exemption G of the Garn–St Germain Depository Institutions Act of 1982 (the act) and section 225.28(b)(11)(vii) of Regulation Y. Title VI of the act amended section 4(c)(8) of the BHC Act to provide that insurance agency, brokerage, and underwriting activities are not ''closely related to banking'' and thus are not permissible activities for bank holding companies, unless the activities are included within one of seven specific exemptions (A through G) in section 4(c)(8).

The applicant claimed that it was authorized to operate a title insurance agency under exemption G, which authorizes those bank holding companies that engaged in insurance agency activities before 1971 to engage, or control a company engaged in, insurance agency activities. The company has been engaged in the sale of insurance related to extensions of credit by its subsidiary banks since 1939.

The bank holding company applicant was one of 16 active companies with grandfather rights under exemption G.[1] Previously, the Board determined (1985 FRB 171) that those companies that had received Board approval to engage in general insurance agency activities before 1971 would be grandfathered under exemption G with respect to the sale of any type of insurance that is within the scope of general insurance agency activities—even an insurance agency activity (such as title insurance) not actually offered by the applicant bank holding company before 1971. The Board found that there is no requirement in the statute that a company qualifying for exemption G engage only in those insurance agency activities it conducted with Board approval before 1971. Thus, although the Board may not have specifically approved title insurance before 1971, provided the proposed activity is encompassed within the authorization of insurance agency activities, the activity falls within exemption G.

The Board determined selling title insurance through a title insurance agency to be permissible pursuant to exemption G and the Board's regulations. The Board approved the application on November 17, 1988 (1989 FRB 31).

1. There are currently 12 companies remaining.

3600.21.1 UNDERWRITING AND DEALING IN COMMERCIAL PAPER TO A LIMITED EXTENT

A bank holding company applied for the Board's approval under section 4(c)(8) of the BHC Act and section 225.21(a) of the Board's Regulation Y to underwrite and deal in third-party commercial paper to a limited extent. As proposed, the activity will be conducted through a commercial finance subsidiary (the company). The company is to act for issuers as an underwriter of commercial paper, purchasing commercial paper for resale to institutional investors such as banks, insurance companies, mutual funds, and nonfinancial businesses. In addition, the company may place commercial paper as agent for issuers and advise issuers on the rates and maturities of proposed issues that are likely to be accepted in the market—activities previously approved by the Board (1987 FRB 138). The activities in this order (1987 FRB 367) differ from those previously authorized (1987 FRB 138) in that the applicant will underwrite and deal in commercial paper as principal.

The Board may not approve a proposal of a member bank affiliate if upon consummation it would be ‘‘engaged principally’’ in the flotation, underwriting, public sale, or distribution of commercial paper (hereafter referred to as ‘‘underwriting and dealing in’’) within the meaning of the former section 20 of the Glass-Steagall Act (12 U.S.C. 377). The Board concluded that even if placement of commercial paper were deemed to constitute an activity, the commercial lending subsidiary would not be ‘‘engaged principally’’ in underwriting and dealing in securities. The subsidiary's activity was not substantial under a former 5 percent limit on the subsidiary's gross income (increased to 25 percent, effective March 6, 1997) from its commercial paper activities and a former 5 percent limit on its market share. The company is required to restrict its commercial paper activities so it does not exceed these limits.

The Board concluded that underwriting and dealing in commercial paper is closely related to banking on the same basis as acting as placement agent and adviser to issuers in commercial paper (1987 FRB 138). Banks provide services that are operationally and functionally similar to the services of underwriting and dealing in commercial paper. Banking organizations are particularly well equipped to provide such services. In the Board's view, the underwriting and dealing activity represents a natural extension of commercial lending activities traditionally conducted by banks, involving little additional risk or new conflicts of interest, and potentially yielding significant public benefits in the form of increased competition and convenience.

The Board concluded that the applicant could conduct the activities to the extent and in the manner described in the order, consistent with the former section 20 of the Glass-Steagall Act and section 4(c)(8) of the BHC Act. The Board's approval extended only to commercial paper underwriting, dealing, placement, and advisory activity conducted in accordance with the limitations stated in the order. (1987 FRB 367)

3600.21.2 ENGAGE IN UNDERWRITING AND DEALING, TO A LIMITED EXTENT, IN MUNICIPAL REVENUE BONDS, MORTGAGE-RELATED SECURITIES, AND COMMERCIAL PAPER

On April 30, 1987, the Board approved by order the applications of three bank holding companies to engage through subsidiaries in underwriting and dealing in commercial paper, one- to four-family mortgage-backed securities, and municipal revenue bonds.[1] (For a complete description of the nonbanking activities authorized by the Board in this order, see 1987 FRB 473.) The subsidiaries are to be involved in underwriting and dealing in U.S. government securities as their major activity. Board approval could only occur if the affiliates would not be ‘‘principally engaged’’ in underwriting and dealing in ‘‘securities’’ under the provisions of the former section 20 of the Glass-Steagall Act.

A hearing was held on February 3, 1987, because of the important legal and factual issues involved. The Board reaffirmed its finding in its previous decisions (1987 FRB 138 and 367) that the applicants were not principally engaged in

1. The applicants had previously received Board approval under section 4(c)(8) of the BHC Act for the subsidiaries mentioned in the order to engage in underwriting and dealing in U.S. government and agency and state municipal securities that state member banks are authorized to underwrite and deal in under section 16 of the Glass-Steagall Act. The newly proposed underwriting and dealing activities were approved in addition to the previously approved activities.

the proposed securities activities if they limited their underwriting and dealing income from these securities to 5 percent of the total gross income of the affiliate, and if they limited their market share in each of these securities to 5 percent of the total domestic market.[2] The Board established a number of conditions to ensure that the underwriting activity would be consistent with safe and sound banking practices and would avoid conflicts of interest, undue concentration of resources, and other adverse effects.

The Board determined, consistent with its previous underwriting and dealing decisions in administering the Glass-Steagall Act, that a range of between 5 percent and 10 percent of gross revenue and market share is the appropriate framework for determining whether an affiliate is engaged principally in securities activities. The lower end of the range—5 percent—was the level applied at the time. The Board noted that it would review this level within a year on the basis of experience gained from operations to determine whether a higher level would be permissible. On September 21, 1989, the Board modified section 20 orders to increase from 5 percent to 10 percent the revenue limit on the amount of total revenues a section 20 subsidiary may derive from ineligible securities underwriting and dealing activities (increased to 25 percent, effective March 6, 1997) (1989 FRB 751).[3]

The Board's approval of the applications extends only to the activities conducted within the limitations of the order and is subject to the gross revenue limitation discussed above. Two of the applicants also proposed to underwrite and deal in consumer-receivable-related securities (CRRs). Although the companies noted certain similarities between these securities and mortgage-related securities, the Board did not believe that the record before the Board provided a sufficient basis for it to make a formal finding (as required by the BHC Act) that underwriting and dealing in CRRs is closely related to banking and a proper incident thereto. The Board noted that the market for CRRs was relatively new and untested compared with the market for one- to four-family mortgage-related securities and municipal revenue bonds. The Board indicated that it would reconsider the matter within 60 days on the basis of more complete information to be submitted by the applicants regarding the types of assets that would be securitized, the manner in which this would be accomplished, and other matters bearing on risk.

In a subsequent order, six BHCs applied for and received the Board's conditional approval (1987 FRB 731) for the activity, but the Board stayed its order for the same period of time applicable to the stay issued by the Second Circuit Court of Appeals (see footnote 2 and section 3600.21.3). After approving the order set out in 1987 FRB 731, the Board approved several other orders that rely on this order and the limitations imposed therein. (See the following Board orders: 1987 FRB 607, 616, 618, 620, 622, 731, 738, 742, 928; 1988 FRB 133, 500, 699, 700, 706, 819; 1989 FRB 33, 190, 396, 398, 520, 645, 647; 1990 FRB 79, 158, 256, 461, 554, 568, 573, 652, 682, 756; 1991 FRB 954; 1992 FRB 338; 1993 FRB 141, 716; and 1994 FRB 249, 346.)

The major difference between the three applications decided on April 30, 1987, and the two applications previously approved by the Board (1987 FRB 138 and 367) is that the underwriting would take place in an affiliate engaged in underwriting and dealing in U.S. government securities. This arrangement raised the major legal question of whether these government securities could serve as a basis for measuring the principal activity of the affiliate. In its approval, the Board took into account the fact that the Glass-Steagall Act specifically allows member banks to underwrite U.S. government securities, and that the act intends affiliates to have a broader scope for underwriting than member banks. On that basis, the Board had previously allowed affiliates of member banks to engage in underwriting of U.S. government securities.

2. The U.S. Court of Appeals for the Second Circuit upheld the Board's determination that the underwriting subsidiaries would not be engaged principally in ineligible securities underwriting and dealing under the above revenue limitation; the U.S. Supreme Court declined to review that decision (*Securities Industry Association v. Board of Governors of the Federal Reserve System*, 839 F.2d 47 (2d Cir. 1988), *cert. denied*, 108 S.Ct. 697 (1988)). The Supreme Court also let stand the lower court's determination that the 5 percent market share limitation was not adequately supported by the facts of record, thus sustaining elimination of the market share test that had been invalidated by the U.S. Court of Appeals. Accordingly, the Board decided not to impose a market share limitation on orders approved on August 4 and 8, 1988.

3. The Board in this order also modified its section 20 orders to permit underwriting and dealing in securities of affiliates if the securities are rated by a nonaffiliated, nationally recognized rating organization or are issued or guaranteed by the Federal National Mortgage Association, the Federal Home Loan Mortgage Corporation, or the Government National Mortgage Corporation, or represent interests in such obligations.

3600.21.3 ENGAGE IN LIMITED UNDERWRITING AND DEALING IN CONSUMER-RECEIVABLE-RELATED SECURITIES

Six bank holding companies applied for the Board's approval to engage in limited underwriting and dealing in consumer-receivable-related securities (CRRs). CRRs, which were first issued in 1985, consist of debt obligations that are secured by or represent an interest in a diversified pool of loans to or receivables from consumers, such as loans to individuals to finance the purchase of automobiles or personal credit card accounts.

The Board concluded that underwriting and dealing in CRRs is an activity closely related to banking on the basis that banks provide services that are operationally and functionally so similar to the services proposed that banking organizations are particularly well equipped to provide them. In accordance with section 16 of the Glass-Steagall Act, banks underwrite and deal in certain mortgage-related securities that are issued or guaranteed by the United States or by U.S. government agencies. Some of the securities represent interests in pools of mortgage loans for residential housing purposes made by banks and other financial institutions. Such securities are very similar to CRRs.

Both CRRs and bank-eligible mortgage-related securities represent interests in pools of loans made by financial institutions to individuals to finance the purchase of housing or consumer goods and services.

The techniques involved in underwriting and dealing in bank-eligible mortgage-related securities are also very similar to those that would be involved in conducting the approved activity with respect to CRRs. In each case, the underwriter must perform substantially identical functions of evaluating prepayment risk, analyzing credit and cash flow from a pool of numerous individuals' loans, negotiating or bidding, and distributing and dealing.

In addition, banks now directly perform some of the functions involved in the approved activity. Banks select the consumer loans that form the pool of interests that are then sold to investors. Banks also advise issuers of CRRs and assist issuers in privately placing these securities.

Because of the similarity between securities involved in CRRs and the previously approved bank-ineligible one- to four-family mortgage-related securities nonbanking activities set forth in a previous order (1987 FRB 473), the Board required that this activity be conducted in accordance with the same requirements established in that order. This includes a requirement that the securities be rated for investment quality by a nationally recognized agency.

The Board concluded, based on the reasons set forth in its previous order (1987 FRB 473), that the approved activity would not result in a violation of the former section 20 of the Glass-Steagall Act and is closely related and a proper incident to banking. The Board's approval of these applications is restricted to underwriting and dealing to a limited extent in securities representing an interest in or backed by a diversified pool of loans to or receivables from individuals for the purchase of consumer goods and services, and the limitations of section 225.25(b)(16) of Regulation Y. (1987 FRB 731)

3600.21.4 LIMITED UNDERWRITING AND DEALING IN DEBT AND EQUITY SECURITIES

Five bank holding companies applied for the Board's approval under section 4(c)(8) of the BHC Act for their wholly owned subsidiaries to underwrite and deal in, on a limited basis—

1. debt securities, including, without limitation, sovereign debt securities, corporate debt, debt securities convertible into equity securities, and securities issued by a trust or other vehicle secured by or representing interests in debt obligations; and
2. equity securities, including, without limitation, common stock, preferred stock, American Depositary Receipts, and other direct and indirect equity ownership interests in corporations and other entities.

Section 16 of the Banking Act of 1933 (the Glass-Steagall Act) prohibits a member bank from underwriting and dealing in these securities (referred to hereafter as ‘‘bank-ineligible securities’’). However, as far as the Glass-Steagall Act is concerned, an affiliate of a member bank may underwrite and deal in bank-ineligible securities so long as it is not engaged principally or substantially in that activity (12 U.S.C. 377).

The applicants had previously received Board approval to underwrite and deal in U.S. government and agency securities and state and municipal securities that state member banks are specifically authorized to deal in under section

16 of the Glass-Steagall Act (referred to hereafter as ‘‘bank-eligible securities’’). The Board had also authorized the subsidiaries to underwrite and deal in commercial paper, one- to four-family mortgage-backed securities, municipal revenue bonds, and consumer-receivable-related securities—all securities that member banks may not underwrite or deal in under section 16 of the Glass-Steagall Act.[4]

To ensure that the subsidiaries would not be principally or substantially engaged in underwriting or dealing in the ineligible securities in violation of the former section 20 of the Glass-Steagall Act, the Board's approval was made subject to the requirement that gross revenues from those ineligible securities activities would not exceed 5 percent of the subsidiary's total gross revenues on average (moving average) over any two-year period. (See 1989 FRB 192 and 196–197.) The Board increased this level to 10 percent on September 5, 1989.

The subsidiaries are also subject to a framework of structural and operating limitations established to avoid the potential for conflicts of interest, unsound banking practices, unfair competition, loss of public confidence in affiliate banks, and other adverse effects from the conduct of the bank-ineligible securities underwriting and dealing activity.

The Board recognized that underwriting and dealing in securities is a natural extension of activities currently conducted by banks, involving manageable risks and potential conflicts of interest when conducted in an organizational structure that insulates these activities from banking activities supported by the federal safety net of deposit insurance and access to Federal Reserve lending. The Board has acknowledged that certain bank holding companies have an existing expertise in securities underwriting, dealing, brokerage, investment advisory activities, and broad financial skills that make them well equipped to provide the new services.

The Board's approval of each application is subject to the conditions stated in previous orders (see 1989 FRB 192; 1990 FRB 158, 455, 573, 652, 683, 756; 1991 FRB 672; 1993 FRB 133, 719; and 1994 FRB 249, 449). The conditions consist of structural and operating limitations designed to avoid conflicts of interest and potential adverse effects, and other conditions designed to ensure safe and sound operations. The conditions include requirements, limitations, and prohibitions with regard to—

1. capital adequacy;
2. credit extensions to customers of the underwriting subsidiary;
3. maintaining the separateness of an underwriting affiliate's activity;
4. disclosures by the underwriting subsidiary;
5. marketing activities on behalf of an underwriting subsidiary;
6. investment advice by bank or thrift affiliates;
7. extensions of credit to the underwriting subsidiary and to purchasers or issuers of ineligible securities (or to major users of projects funded by industrial revenue bonds);
8. transfers of information;
9. reporting and recordkeeping requirements;
10. transfer of activities and formation of subsidiaries of an underwriting subsidiary to engage in underwriting and dealing; and
11. reciprocal arrangements and prohibitions against discriminatory treatment regarding unaffiliated securities firms.

3600.21.5 ACTING AS A DEALER-MANAGER IN CONNECTION WITH CASH-TENDER AND EXCHANGE-OFFER TRANSACTIONS

In connection with a bank holding company application to underwrite and deal in, to a limited extent, all types of equity securities through its section 20 nonbanking subsidiary, an applicant also proposed to act as a dealer-manager in connection with cash-tender and exchange-offer transactions. Dealer-managers generally act as agent for tender or exchange offerors in arranging or facilitating mergers, acquisitions, and other corporate transactions. All-cash tender offers do not, of themselves, involve the issuance, public sale, or distribution of securities. The Board thus concluded that all revenues derived from the section 20 company acting as a dealer-manager in connection with such tender offers may be treated as bank-eligible revenues for purposes of determining compliance with the Board's 10 percent revenue limitation (changed to 25 percent, effective March 6, 1997) on bank-ineligible securities activities. The Board approved the application on November 24, 1993 (see 1994 FRB 49, footnote 5).

4. See the following Board orders: 1987 FRB 473, 607, 616, 618, 620, 622, 731, 738, 742, 928; 1988 FRB 133, 500, 699, 706, 819; 1989 FRB 33, 190, 396, 398, 520, 645, 647; 1990 FRB 79, 158, 256, 461, 554, 568, 573, 652, 682, 756; 1991 FRB 672; 1993 FRB 133, 719; and 1994 FRB 249, 449.

3600.21.6 UNDERWRITING "PRIVATE OWNERSHIP" INDUSTRIAL DEVELOPMENT BONDS

A bank holding company (the notificant) provided notice under section 4(c)(8) of the Bank Holding Company Act (BHC Act) (12 U.S.C. 1843(c)(8)) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) of its proposal to engage de novo through its section 20 subsidiary (the company) in underwriting, to a limited extent, certain "private ownership" industrial development bonds. The bonds are issued for the provision of the following governmental services: water facilities, sewer facilities, solid waste disposal facilities, electric energy and gas facilities, and local district heating or cooling facilities (collectively, traditional governmental services). The notificant controls one bank subsidiary.

The company is currently engaged in limited underwriting and dealing in certain municipal revenue bonds, activities permissible under section 20 of the Glass-Steagall Act (12 U.S.C. 377).[5] The company is a broker-dealer registered with the Securities and Exchange Commission (SEC) under the Securities Exchange Act of 1934 (15 U.S.C. 78a et seq.) and is a member of the National Association of Securities Dealers, Inc. (NASD). Thus, the company is subject to the recordkeeping and reporting obligations, fiduciary standards, and other requirements of the Securities Exchange Act of 1934, the SEC, and the NASD. The notificant engages directly and through subsidiaries in other permissible nonbanking activities.

The Board previously determined that the activities of underwriting and dealing in municipal revenue bonds, including industrial development bonds, are so closely related to banking as to be proper incidents thereto within the meaning of section 4(c)(8) of the BHC Act.[6] Certain bank holding companies previously requested approval to underwrite and deal in only municipal revenue bonds, as opposed to a full range of debt securities. Their requests were limited to underwriting and dealing in industrial development bonds that are "public ownership" industrial development bonds. Public ownership industrial development bonds are those "tax-exempt bonds where the issuer, or the governmental unit on behalf of which the bonds are issued, is the sole owner for federal income tax purposes of the financed facility."[7]

The notificant plans to engage through the company in underwriting private ownership industrial development bonds issued solely for the provision of traditional governmental services. It committed to conduct this activity subject to the same limitations and other conditions that govern underwriting and dealing in public ownership industrial development bonds.[8]

The underwriting risk and the risk analysis required to underwrite private ownership industrial development bonds issued for traditional governmental services is essentially the same as the risk and analysis related to underwriting traditional public ownership bonds. For each, the funds for the repayment of the bonds are derived from revenue generated by the financed facility, including revenue resulting from a service contract between the owner/lessor of the financed facility and a state or local government or political subdivision, pursuant to which the state or local government or political subdivision agrees to purchase the output of the facility.[9] The notificant committed that all the private ownership bonds that the company would

5. See 1993 FRB 716.

6. *Citicorp, J.P. Morgan & Co. Incorporated, and Bankers Trust New York Corporation*, 1987 FRB 473, *aff'd sub nom. Securities Industry Ass'n v. Board of Governors of the Federal Reserve System*, 839 F.2d 47 (2d Cir.), *cert. denied*, 486 U.S. 1059 (1988), as modified by order approving modifications to section 20 orders, 1989 FRB 751 ("*Citicorp/Morgan/Bankers Trust*"). See also *J.P. Morgan & Co. Incorporated, et al.*, 1989 FRB 192, *aff'd sub nom. Securities Industry Ass'n v. Board of Governors of the Federal Reserve System*, 900 F.2d 360 (D.C. Cir. 1990).

7. See 1987 FRB 502. Examples of financed facilities include airports and mass-commuting facilities.

8. *Citicorp/Morgan/Bankers Trust*. All the bonds that the notificant proposed that the company underwrite would qualify as "exempt facility bonds" under the Internal Revenue Code (the code). See 26 U.S.C. 142. The types of exempt facility bonds that the company would underwrite may, subject to certain volume caps and other limitations, be tax-exempt under the code even if the proceeds of the bonds are used to finance facilities that are privately owned. See 26 U.S.C. 103, 141, 142, 146, and 147.

9. Typically, in the case of public ownership bonds, the governmental unit that issues the bonds owns the financed facility and repays the bonds from the revenue generated by the facility and this service contract. The governmental unit may also enter into a contract with a third party to operate the financed facility. In the case of the private ownership bonds that the notificant plans to underwrite, the governmental unit that issues the bonds either uses the proceeds of the bonds to acquire or construct a facility, which the governmental unit then leases to a third party, or lends the proceeds of the bonds to a third party to acquire or construct the facility. The third party agrees to make lease payments or loan repayments to the governmental unit that enable the governmental unit to pay debt service on the bonds. As security for the lease or loan agreement, the third party assigns and pledges the revenues generated by the facility and a service contract with a state or local government or political subdivision.

underwrite would be rated "investment quality" by a nationally recognized rating agency to the same extent as are the municipal revenue bonds that the company currently underwrites.

Considering these circumstances, the Board concluded that underwriting and dealing in private ownership bonds issued for the provision of traditional governmental services is a permissible activity if conducted subject to the conditions and prudential limitations set forth in *Citicorp/Morgan/Bankers Trust* (1987 FRB 473 and 1989 FRB 751 (Modification Order)) and agreed to in 1993 FRB 716. The notification was approved on October 24, 1995 (see 1995 FRB 1116).

A foreign bank subject to the Bank Holding Company Act applied for the Board's approval to engage in various nonbanking activities, one being to purchase mortgage loans and to issue securities for its own account, through a wholly owned subsidiary or third party servicers, and to sell securities guaranteed by the Government National Mortgage Association (GNMA). Because National Banks are specifically authorized under the Glass–Steagall Act (12 U.S.C. 24) to issue and sell securities guaranteed by GNMA, as well as to underwrite and deal in such securities, the Board concluded that the issuance and sale of GNMA securities is closely related to banking (1988 FRB 573). In addition, the Board determined that the statutory exemption reflects a Congressional determination that GNMA securities are not the type of securities that would lead to unsound speculation or that the public interest in the issuance and sale of GNMA securities by banks outweighs any potential harm resulting therefrom. Also, the Board previously determined that underwriting and dealing in GNMA certificates is of sufficiently low risk to be generally permissible activities for bank holding companies (12 C.F.R. 225.25(b)(16)).

A foreign bank, subject to Section 4 of the BHC Act, applied for the Board's permission to acquire, through its wholly owned subsidiary, all the shares of a company located in New York, New York. The acquired company would engage in several nonbanking activities. Two of the activities, not previously approved by the Board for BHCs, consisted of acting as a sales tax refund agent for the State of Louisiana and Cashing U.S. Dollar Payroll Checks Drawn on Unaffiliated Banks. Both activities were found to be closely related to banking subject to the facts and conditions found in the Board order and briefly discussed below. The application was approved on August 15, 1990 (1990 FRB 860).

3600.24.1 ACTING AS A SALES TAX REFUND AGENT FOR THE STATE OF LOUISIANA

The company being acquired serves as the State's exclusive sales tax refund agent for its tax-free shopping program for foreign visitors. Under the program, foreign visitors present sales invoices evidencing sales taxes paid in Louisiana to the company's office in the state. It refunds the tax in U.S. dollars to the visitor, less a handling fee. A portion of the handling fee is then remitted to the State and local tax authorities refund to the company the amount of tax refunds advanced. The Board found the activity to be closely related to banking since banks: (1) routinely forward to taxing authorities tax receipts delivered to the bank on taxes due; (2) commonly act as fiscal agent for government authorities which involves disbursing funds on behalf of state and local governments.

3600.24.2 CASHING U.S. DOLLAR PAYROLL CHECKS DRAWN ON UNAFFILIATED BANKS

The company being acquired also cashes, and the Applicant plans to continue cashing, U.S. dollar payroll checks on a limited basis, primarily to accommodate employees in airport facilities that lack banking services, but where the company maintains offices. Since check cashing is a fundamental banking activity performed routinely by banks, and the company being acquired proposed to cash only checks drawn on unaffiliated banks, the Board found the activity to be closely related to banking. The Board stipulated, however, that the Applicant was not to use the acquired company's offices as branches of the Applicant or any affiliated bank.

Permissible Activities by Board Order (Providing Government Services) Section 3600.25

A bank holding company (the notificant) requested the Board's approval, under section 4(c)(8) of the BHC Act and section 225.24(a) of Regulation Y, to acquire through its wholly owned subsidiary a cash-express company, certain assets of an exchange company, and another firm to engage in various nonbanking activities. Many of the nonbanking activities had previously been determined by the Board to be closely related to banking in Regulation Y, by order, or by interpretation. In addition to those nonbanking activities already approved, the notificant requested the Board's approval to engage in providing various governmental service activities at the offices of the cash-express company:

1. postage stamps and postage-paid envelopes
2. vehicle registration services, including the sale, distribution, and renewal of license plates and license tags for motor vehicles
3. public-transportation tickets and tokens
4. notary public services

The Board noted that banks are permitted to provide customer access to the type of government services involved in the proposal, whereby the banks may be acting in an agency capacity or accomplishing the distribution of some of the services using automated teller machines (ATMs).[1] The Board thus concluded that the proposed nonbank activities are closely related to banking. Based on all the facts and commitments provided by the notificant, and the representations and conditions relied upon in reaching a decision, the Board approved the proposal on April 2, 1998 (1998 FRB 481).

1. See 12 C.F.R. 7.1010 and OCC Interpretive Letter No. 718 (March 14, 1996) (postage stamps, acting as an agent for the state in selling and renewing license plates and license tags, and public-transportation tickets from ATMs). See also OCC Conditional Approval Letter No. 267 (January 12, 1988)(notary services).

A BHC Applicant requested the Board's permission under section 4(c)(8) of the BHC Act to acquire all the outstanding shares of a company engaged in title insurance agency and real estate settlement activities. The Board previously determined that title insurance agency activities are permissible under section 4(c)(8)(G) of the BHC Act, for which the BHC Applicant qualifies.

The real estate settlement services consist of: (1) reviewing the status of the title in the title commitment, resolving any exceptions to the title, and reviewing the purchase agreement to identify any requirement in it in order to ensure compliance with them; (2) verifying payoffs on existing loans secured by the real estate and verifying the amount of and then calculating the pro rating of special assessments and taxes on the property; (3) obtaining an updated title insurance commitment to the date of closing, preparing the required checks, deeds, affidavits, and obtaining any authorization letters needed; (4) establishing a time and place for the closing, conducting the closing, and ensuring that all parties properly execute all appropriate documents and meet all commitments; (5) collecting and disbursing funds for the parties, holding funds in escrow pending satisfaction of certain commitments, preparing the HUD settlement statement, the deed of trust, mortgage notes, the Truth-in-Lending statement, and purchaser's affidavits; and (6) recording all of the documents required under law.

In reviewing the proposed activity, the Board noted that real estate settlement services are provided by the Applicant's bank subsidiaries in connection with their origination of mortgage loans, and banks within the Applicant's state are generally permitted to conduct real estate settlement activities. It was further noted that banks routinely prepare collateral security agreements and other documentation required to close loans in accordance with federal and state lending requirements as part of the general lending activities authorized under the Board's Regulation Y.

The Board concluded that aspects of the proposed real estate settlement activities are directly linked to permissible title insurance agency activities by BHCs. These activities can directly affect the insured risks under a title insurance policy. Title insurance agents have special experience in assessing potential title defects that can arise in real estate settlement. Title insurance agents thus have the expertise to generally engage in real estate settlements.

For these reasons, the proposed real estate settlement activities conducted through a permissible title insurance agency, were deemed by the Board to be closely related to banking for purposes of section 4(c)(8) of the BHC Act. The Board approved the application by order on October 15, 1990 (1990 FRB 1058).

A bank holding company (the applicant) applied under sections 3(a)(3) and 4(c)(8) of the BHC Act to acquire another company (the company), thereby indirectly acquiring its subsidiary (the subcompany) as well as the subsidiary bank and nonbank companies of the company and the subcompany. Upon consummation of the transaction, the company and subcompany would be subject to the provisions of the BHC Act. Both companies applied for permission under section 3(a)(1) of the BHC Act to become a bank holding company.

The applicant also applied for the Board's permission to engage, through one subsidiary of the subcompany (the adviser), in providing administrative and certain other services to mutual funds, nonbanking activities that the Board has not previously considered under section 4(c)(8) of the BHC Act. The applicant also applied for the Board's permission to acquire certain other nonbanking subsidiaries of the company (as listed in appendix B of the order) to engage in making or servicing loans, providing trust services, and providing investment advisory nonbanking services pursuant to section 225.28(b)(1), (b)(5), and (b)(6) of Regulation Y.

In addition, the applicant provided notice of its intent to indirectly acquire a foreign trust company, a trust administration company, and an advisory company. The companies engage in activities that are permissible under section 211.10 of Regulation K.

3600.27.1 GLASS-STEAGALL ACT ISSUES IN PROVIDING ADMINISTRATIVE SERVICES

The administrative services the applicant proposed to provide through the adviser and its affiliates raised a number of issues under the Glass-Steagall Act. Under that act, a company that owns a member bank may not control "through stock ownership or in any other manner" a company that engages principally in distributing, underwriting, or issuing securities.

Because mutual funds continuously issue and redeem securities, the Board in 1972 issued an interpretation setting out its position on the Glass-Steagall Act as it governs the relationship between mutual funds and companies that own member banks (12 C.F.R. 225.125). The Board found that the Glass-Steagall Act prohibits affiliates of banks from sponsoring, organizing, or controlling mutual funds or distributing their shares.

The Board also found, however, that the Glass-Steagall Act does not prohibit all relationships between a bank holding company and a mutual fund and that it is permissible, under the BHC Act and the Glass-Steagall Act, for bank holding companies to provide investment advice to mutual funds. Also, the Board found that the Glass-Steagall Act does not prohibit bank holding companies from providing certain other services to mutual funds, such as acting as custodian, transfer agent, or registrar.[1] Banks and affiliates of banks may serve as investment adviser, transfer agent, custodian, and registrar. *They may not act as distributor to the fund.* The application raised the question whether it was consistent with the Glass-Steagall Act for an affiliate of a member bank to act as an administrator to a mutual fund.

3600.27.2 PERMISSIBILITY OF PROPOSED ADMINISTRATIVE-SERVICES ACTIVITIES

The adviser furnishes a variety of services to open-end investment companies (mutual funds) and closed-end investment companies in the United States. Because certain of the activities of the adviser and its affiliates are prohibited by the Glass-Steagall Act, the applicant has taken steps and has committed to terminate the

1. The Board imposed a number of restrictions on the relationship between bank holding companies and mutual funds to avoid conflicts of interest and to address potential safety-and-soundness concerns. The Board's rule includes restrictions preventing a bank holding company or any of its subsidiaries from—

- acting as investment adviser to any investment company that has a name similar to the holding company or any of its subsidiary banks;
- purchasing for its own account shares of any investment company for which the holding company serves as investment adviser;
- purchasing in its sole discretion in a fiduciary capacity shares of an investment company advised by the holding company; or
- extending credit to an investment company advised by the holding company as collateral for a loan used to purchase shares of the investment company.

In addition, the rule requires that, in cases in which a customer purchases or sells securities of the fund through the holding company or is advised by the holding company to purchase shares of the fund, the customer be informed in writing of the holding company's involvement with the fund, and be informed that the shares of the fund are not federally insured and are not guaranteed by, or obligations of, a bank.

adviser's role as a sponsor of new mutual funds. The applicant also committed that it would not acquire those of the adviser's subsidiaries that engaged in the distribution of mutual fund shares. The applicant further committed that it would not be involved in the distribution of the shares of any mutual fund. The applicant represented to the Board, that, after the acquisition of the company, neither the adviser nor any of its affiliates would be obligated by any agreement to engage in any sales activities in connection with any mutual fund's shares and would not enter into any distribution agreement with any mutual fund, unless permitted to do so by a change in current law.

The adviser will not—

1. engage in the development of marketing plans except to give advice to the distributor regarding regulatory compliance;
2. engage in advertising activities with respect to the funds and will not be involved in the preparation of a fund's sales literature, except to review it for the sole purpose of ensuring compliance with pertinent regulatory requirements; or
3. permit employees of the adviser to engage in sales activities at meetings or seminars (such activities would be conducted solely by the fund's distributor).

It was noted that the applicant did not propose providing administrative services to those mutual funds that are marketed and sold primarily to customers of any of the applicant's subsidiary banks.

The Board believes that it is permissible under the Glass-Steagall Act for the applicant to provide the following administrative services to mutual funds as proposed:

1. maintaining and preserving the records of the fund, including financial and corporate records
2. computing the fund's net asset value, dividends, and performance data and financial information regarding the fund
3. furnishing statistical and research data
4. preparing and filing with the Securities and Exchange Commission (SEC) and state securities regulators registration statements, notices, reports, and other material required to be filed under applicable laws
5. preparing reports and other informational materials regarding the fund, including proxies and other shareholder communications, and reviewing prospectuses
6. providing legal and regulatory advice to the fund in connection with its other administrative functions
7. providing office facilities and clerical support for the fund
8. developing and implementing procedures for monitoring compliance with regulatory requirements and compliance with the fund's investment objectives, policies, and restrictions as established by the fund's board
9. providing routine fund accounting services and liaison with outside auditors
10. preparing and filing tax returns
11. reviewing and arranging for payment of fund expenses
12. providing communication and coordination services with regard to the fund's investment adviser, transfer agent, custodian, distributor, and other service organizations that render recordkeeping or shareholder communication services
13. reviewing and providing advice to the distributor, fund, and investment adviser regarding sales literature and marketing plans to ensure regulatory compliance
14. providing the distributor's personnel with information about fund performance and administration
15. participating in seminars, meetings, and conferences designed to present information to brokers and investment companies, but not in connection with the sale of shares of the funds to the public, concerning the operation of the funds, including administrative services provided by the bank holding company to the funds
16. assisting existing funds in the development of additional portfolios
17. providing reports to the fund's board regarding fund activities

A mutual fund administrator provides services that are essentially ministerial or clerical. The administrator does not have policymaking authority or control over the mutual fund. The policymaking functions rest with the board of directors of the mutual fund. The board of directors is responsible for the selection and review of the major contractors to the fund, including the investment adviser and, in certain circumstances, the administrator.

The Investment Company Act of 1940 requires that at least 40 percent of the board of directors of a mutual fund be disinterested persons who are not affiliated with the investment adviser, with any person that the SEC has determined to have a material business or professional relationship with the fund, with any employee or officer of the fund, with any registered broker or dealer, or with any other interested or affiliated person. These unaffiliated board members must approve the fund's contracts with its investment adviser, underwriter, and often its administrator. The applicant committed that the adviser will provide administrative services only to mutual funds whose board of directors consists of a majority of disinterested persons.

In situations in which the applicant's subsidiaries serve as administrator to the mutual fund, the Board permitted one representative of the administrator to serve as a director of the fund. The applicant contended that such an interlocking director would facilitate the provision of administrative services by providing the fund with a person knowledgeable in the operation of the fund who would be in a position to advise the board of directors on administration.

The applicant proposed that a director interlock would be used only in situations in which a company unaffiliated with it serves as the investment adviser to the mutual fund. With regard to the adviser's serving as an administrator, this interlocking director would be deemed an interested person and would be excluded from those actions that must be taken by disinterested board members, such as the approval of an investment advisory contract or a contract for the administrator. The applicant committed that the adviser would serve as administrator only to mutual funds for which a majority of the board of directors are disinterested individuals. The Board believed that, in this proposed arrangement, the applicant would not control a mutual fund if one employee of the adviser or an affiliate[2] would serve as a director of a mutual fund to which the advisor provides administrative services.

The applicant plans, in a small number of cases, to provide mutual funds with a combination of administrative, investment advisory, and other services. The OCC has permitted national banks that serve as investment adviser to mutual funds also to provide some administrative services to those mutual funds. In addition, a number of national banks have been providing these and other services as ''subadministrator'' to mutual funds that are advised by the bank or an affiliate.

In the Board's opinion, permitting a bank holding company that serves as investment adviser to a mutual fund and also in essence provides ministerial or supporting functions as administrator to that fund would not significantly increase the bank holding company's ability to control the mutual fund. In other words, the adviser would not, by virtue of becoming an administrator to a fund that it or an affiliate advises, become involved in policymaking functions of these funds to a greater extent than when it provides solely investment advisory services. The Board believes that control would continue to rest with the board of directors of the mutual fund.

With regard to providing a combination of advisory and administrative services, the applicant further committed that it would not have any director or officer interlocks with these mutual funds. It would also not have any director or officer interlocks with mutual funds to which it provides both advisory and administrative services.

In providing the combination of services, the applicant would be subject to the Board's interpretation on investment advisory activities (12 C.F.R. 225.125) and would therefore be required to conform the adviser's activities to the interpretation within two years. On this condition, and subject to the commitments made by the applicant, the Board concluded that the proposal was permissible under the Glass-Steagall Act.

3600.27.3 BOARD'S CONCLUSION ON PROVIDING ADMINISTRATIVE SERVICES

The Board found the applicant's proposed activities to be closely related to banking because (1) it had previously determined by regulation that a bank holding company could act as investment adviser to a mutual fund; (2) national banks, including national bank trust departments, provide administrative services to mutual funds; and (3) it had also permitted bank holding companies to provide certain individual financial data processing services (calculation of investment values and tax consulting) by a mutual fund administrator. The Board thus approved the application on April 21, 1993 (1993 FRB 626), based on the facts of record and all of the commitments and representations made by the applicant, and subject to the terms and conditions set forth in the order.

2. This director cannot serve as an officer, director, or employee of the applicant, its bank, or any subsidiary bank or bank holding company of the applicant.

A foreign banking organization (FBO), subject to the provisions of the Bank Holding Company Act, had requested the Board's approval to acquire, through a wholly owned subsidiary (the company), substantially all the assets of an asset-management partnership (the partnership). The company would be an investment adviser registered with the Securities and Exchange Commission (SEC) under the Investment Company Act of 1940. The company's acquisition of the partnership would also include a membership interest in a services firm that would provide transfer-agency services to mutual funds advised by the company (the funds).

The FBO, among other things, proposed to provide marketing support to a mutual fund by directly contacting broker-dealers, 401(k) plan providers, financial planners, insurance companies, and other financial intermediaries to recommend the funds. It would be primarily responsible for the development of marketing plans and the preparation of advertising and sales literature materials for the funds. The Board had not previously considered whether a bank holding company could provide promotional or marketing services to the extent that was proposed.

3600.28.1 CONTROL CONSIDERATIONS INVOLVING PROMOTIONAL AND MARKETING ACTIVITIES

Under the Glass-Steagall Act, a company that owns a member bank may not own or control "through stock ownership or in any other manner" a company that engages principally in distributing, underwriting, or issuing securities.[1] The Board has found that this provision prohibits affiliates of banks from sponsoring, organizing, or controlling a mutual fund. The Board previously has determined, however, that the Glass-Steagall Act does not prohibit a bank holding company from providing advisory and administrative services to a mutual fund.[2]

The proposed promotional and marketing activities would not, it was believed, cause the FBO to control the funds or to be involved in the underwriting and distribution of the funds' securities to the public. The proposed promotional activities involved contact only with financial intermediaries. The activities are similar to the activities previously approved by the Board. The Board had previously permitted bank holding companies to present information about the operations of the mutual funds advised and administered by the bank holding company at meetings or seminars for brokers of mutual funds.[3] In addition, the Office of the Comptroller of the Currency (OCC) had also authorized subsidiaries of national banks to provide marketing and advertising support to mutual funds in connection with their brokerage and advisory services.

As for the distribution and sales of the funds, it was proposed that an independent distributor be given that responsibility.[4] The independent distributor would serve as the principal underwriter of the funds and would enter into sales agreements with financial intermediaries to sell shares of the funds on their behalf.[5] Actual sales would be conducted by the independent distributor or by an independent broker-dealer for the funds.

The FBO did not propose to solicit retail customers to purchase shares in particular funds, to accept orders for the purchase of shares, or to engage in any retail sales activities. Neither the company nor any of its employees would receive transaction-based income or commissions in connection with the company's promotional or marketing activities.

The company would have primary responsibility for preparing the advertising and marketing materials. The independent distributor, however, would be responsible for placing all advertisements. The independent distributor would also have legal responsibility, under the rules of the National Association of Securities Dealers (NASD), for the form and use of all advertising and sales literature prepared by the company, and would also be responsible for filing these materials with the NASD or SEC.

For the reasons cited, the Board believed that the promotional and marketing activities pro-

1. 12 U.S.C. 221a and 377.
2. See 12 C.F.R. 225.28(b)(6) and 12 C.F.R. 225.125.
3. See 1993 FRB 626 (footnote 15).
4. The FBO committed that none of its U.S. affiliates, including the company, would be obligated by any agreement to engage in any sales activities with regard to shares of the funds, nor would such affiliates enter into any distribution agreement with the funds without the prior approval of the Board.
5. The funds could enter into distribution agreements with intermediaries, but in no event could the company enter into such agreements.

posed by the FBO would not involve the company in the underwriting or distribution of shares of the funds for the purposes of the Glass-Steagall Act.

3600.28.2 MANAGEMENT INTERLOCK CONTROL CONSIDERATIONS

The FBO also proposed that the chief executive officer serve as the chairman of the four-member board of trustees of the funds and that no more than three officers or employees of the company serve as junior-level officers of the funds. The employees would serve as assistant secretary, assistant treasurer, or assistant vice president of the funds, and would be supervised by the board of trustees or senior-level officers. These employees would have no policymaking authority at the funds and would not be responsible for, or involved in, making recommendations on policy decisions. No employee or officer of the company would serve as a senior-level officer of the funds.

The Board had previously authorized a bank holding company to have director and officer interlocks with mutual funds that the bank holding company advises or administers.[6] The Board concluded that the proposed interlocks between the company and the funds, in this case, would not compromise the independence of the boards of trustees of the funds, compromise the independent distribution of the funds, or result in control of the funds by the FBO.

Based on the facts given, the Board concluded that the control of the funds would rest with the independent members of the boards of trustees of the funds, and that the proposed interlocks between the company and the funds would not compromise the independence of the boards of the funds or permit the FBO to control the funds. The Board concluded that the proposal was consistent with the Glass-Steagall Act. The notice was approved on June 16, 1997. See 1997 FRB 679, 1998 FRB 1075–77, 1998 FRB 852–853, and 1998 FRB 680–82.

6. See 1996 FRB 1129.

A bank holding company gave notice under section 4(c)(8) of the Bank Holding Company Act (BHC Act) (12 U.S.C. 1843(c)(8)) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) of its intention to engage de novo through its mortgage subsidiary in providing employment histories to third parties for a fee.

The employment histories to be provided by the mortgage subsidiary would include the names of past and current employers of an individual and the salary and length of employment for each position, if the individual has consented to the release of such information. The mortgage subsidiary would compile an individual's employment history from information available from state departments of employment services and other similar sources. This information would be provided for a fee to any third-party credit grantor for the purpose of assessing the creditworthiness of a prospective borrower.[1]

3600.29.1 CREDIT-RELATED EMPLOYMENT HISTORIES

The mortgage subsidiary will provide employment histories to third-party credit grantors, including depository and nondepository grantors, for use in making decisions to extend credit only with the express consent of the individual involved. The bank holding company committed that the mortgage subsidiary will comply with the Fair Credit Reporting Act (15 U.S.C. 1681 et seq.) (FCRA) and all applicable state and federal laws and regulations.

In the normal course of their lending activities, banks collect and analyze employment and salary information, including names of past and current employers and salary histories. The Board previously determined that providing past credit information, which includes employment history information, to a credit grantor who is considering a borrower's application for credit is an activity that is closely related to banking and permissible for bank holding companies.[2] Accordingly, the Board concluded that providing employment histories to third-party credit grantors for use in making decisions to extend credit is an activity that is closely related to banking.

3600.29.2 NON-CREDIT-RELATED EMPLOYMENT HISTORIES

The bank holding company also intends to provide employment histories to third-party depository institutions and their affiliates, including credit unions and their affiliates, for use in the regular course of their business, including the hiring of employees. The mortgage subsidiary would provide this information to such entities only with the express consent of the individual involved. Regardless of whether the customer is a third-party depository institution or other credit grantor, the activity would only involve providing employment information. The bank holding company does not plan to provide any additional service, such as analyzing an individual's creditworthiness. The bank holding company committed that its mortgage subsidiary will comply with the FCRA and all applicable state and federal laws and regulations in performing the proposed activity.

The Board had not previously determined whether providing such employment information to third parties for a fee is closely related to banking under section 4 of the BHC Act and, therefore, permissible for bank holding companies. The Board had previously permitted bank holding companies to provide employment information, including employment histories, to depository institutions and their affiliates in connection with the provision of career counseling services (see section 3600.15.1.1).[3] To the extent that these organizations use the information to be provided by the mortgage subsidiary for other purposes, it will only be used in connection with the operation of their banking business.

The Board thus concluded that providing employment histories for use by depository institutions and their affiliates in the regular course of their business is an activity that is closely related to banking. For these reasons, the Board, on May 8, 1995, approved the bank holding company's notice to provide such employment information (1995 FRB 732). The

1. Credit grantors could include lessors if the leasing transaction was the functional equivalent of an extension of credit.

2. See Regulation Y, section 225.25(b)(24) (12 C.F.R. 225.25(b)(24)). The bank holding company committed that it would not promote its mortgage subsidiary as a provider of employment information to non–depository institutions for general business purposes unrelated to credit decisions.

3. See 1994 FRB 51.

approval was specifically conditioned on compliance with the commitments made in connection with the notice.

3600.30.1 REAL ESTATE TITLE ABSTRACTING ACTIVITIES

A bank holding company (the notificant) gave notice under section 4(c)(8) of the Bank Holding Company Act (the BHC Act) (12 U.S.C. 1843(c)(8)) and section 225.23 of the Board's Regulation Y (12 C.F.R. 225.23) of its intention to acquire a title abstracting company (the company) and thereby engage in real estate title abstracting in the state of Iowa.[1] Real estate title abstracting, as proposed by the notificant, is limited to reporting factual information concerning the interests or ownership of selected real property. An abstracter obtains this information by performing a title search of records maintained at a local public records office to determine the ownership history of the property, including any liens, encumbrances, mortgages, or future interests affecting it. The abstracter then prepares a written report, also known as an ‘‘abstract of title,'' that recites the results of the title search. Because Iowa state law does not permit the sale of title insurance, real estate lenders obtain the opinion of an attorney certifying that title to a particular parcel of real property is free of defects. The abstract of title provides the factual information necessary for the attorney to determine whether a lender would have an unencumbered security interest in the property to be mortgaged.

The notificant proposes to provide real estate title abstracting services to affiliated and unaffiliated lenders in an Iowa county. The company would perform the proposed activities in connection with real estate loans made by affiliates or unaffiliated companies and, in certain cases, when no financing is provided, such as in connection with intrafamily transfers of real estate and property distributed as part of estate planning.

The notificant would not provide any insurance against title defects, guarantee any title, or provide any certification with respect to a title. The notificant would be liable for damages caused by negligence in performing a title search but would not be responsible for any defects in the title.[2] The equivalent of title insurance in Iowa is provided by the attorney who certifies that the title is free from defects. The Board has not previously determined that providing real estate title abstracting is closely related to banking under section 4(c)(8) of the BHC Act and, therefore, permissible for bank holding companies.

The Board believes that the proposed real estate title abstracting activities are integrally related to the provision of loans secured by real estate. A bank must be aware of any encumbrances on property that serves as collateral for a loan made by the bank. Banks in the state typically rely on an attorney's opinion, based on information in an abstract of title, to determine that they have a secured position in real estate serving as collateral. The abstract of title provides information necessary to determine the adequacy of the real estate collateral for the loan and is an integral part of secured real estate lending in Iowa. Thus, the bank has a particular need for the information in the abstract of title. Accordingly, the Board believes that the proposed activities are integrally related to the provision of secured real estate lending and, therefore, are closely related to banking.

The Office of the Comptroller of the Currency (OCC) has authorized national banks to conduct this activity.[3] The OCC has concluded that the performance of a title search and the preparation of an abstract of title are necessary parts of the real estate lending process and that it would be convenient and useful under the applicable standards in the National Bank Act for national banks to be able to perform these tasks themselves.[4]

The proposed activities are not equivalent to providing title insurance—an activity that is not generally permissible under section 4(c)(8) of the BHC Act.[5] Title insurance generally includes providing an indemnification against losses resulting from a title defect discovered after the conveyance of property. Title insurance typically protects a purchaser or lender against claims not identified by a title search or claims not specifically exempted by the title insurance policy. The notificant does not propose to certify or guarantee title and would not be liable to the purchaser or the lender for any title defects.

1. The notificant would merge the company into its wholly owned leasing subsidiary.

2. Title abstracters may insure against liability for negligence by purchasing an errors and omissions policy.

3. OCC Interpretative Letter No. 450, September 22, 1988.

4. National banks are not permitted to sell title insurance.

5. Section 4(c)(8) provides that insurance agency, brokerage, and underwriting activities are not ‘‘closely related to banking'' and, thus, are not permissible activities for bank holding companies, unless the activities are included within one of seven specific exemptions (A through G) in section 4(c)(8) (12 U.S.C. 1843(c)(8)(A)–(G)).

The Board concluded, based on all the facts of record, that the proposed activities are closely related to banking and approved the notice on June 30, 1995. (See 1995 FRB 805.) Approval of the proposal was specifically conditioned on the notificant's compliance with the commitments made in connection with the notice.

3600.30.2 AIRCRAFT TITLE ABSTRACTING ACTIVITIES

An attorney representing a bank holding company (BHC) requested an opinion as to whether the providing of title abstracts on U.S.-registered aircraft would be a permissible activity for a new subsidiary of a BHC. The aircraft title abstracting activities would be limited to reporting factual information concerning the ownership history of the relevant aircraft and the existence of liens or encumbrances affecting the aircraft. The information would be obtained by performing a title search of records. The title search would be documented in a written report, known as an ‘‘abstract of title,’’ describing the factual information located by the title search concerning the existing title owner of the aircraft, previous transfers of the aircraft's title, and the existence of any liens or encumbrances affecting title to the aircraft.[6] The subsidiary would provide the information to affiliated and unaffiliated lenders and other parties in connection with aircraft financing and sales transactions. The aircraft title abstracting activities would not include providing insurance against defects in the title of any aircraft, guarantee any aircraft title, or provide any certification with respect to an aircraft title. Based on facts and information provided and other facts, the Legal Division staff issued an opinion on October 7, 2002, that concluded that the proposed aircraft title abstracting to be conducted by the subsidiary would be within the scope of the title abstracting activities previously authorized by the Board on June 30, 1995. (See 1995 FRB 805, 806.)

6. The attorney requesting the opinion reported that federal law requires that all changes in title of, and liens and encumbrances affecting, U.S.-registered aircraft must be filed with the Federal Aviation Administration.

The BHC Act states that a nonbank activity is impermissible unless explicitly exempt from the general prohibition of section 4. While this could cause an unlimited list of impermissible activities, the Board has compiled a list of activities which have been specifically determined to be impermissible (see Manual section 3000.0, Appendix 3).

The inspection objective is to determine whether a specific activity conducted by a bank holding company or its subsidiary is permissible for the bank holding company. The Board has ruled specific activities to be impermissible although it has stated also that certain impermissible activities may be engaged in under limited special circumstances.

In addition, a bank holding company may be entitled to grandfather privileges which are considered as either permanent (where there is no deadline for termination of an activity) or temporary, in which case the activity must have been terminated prior to December 31, 1980. A holding company may be granted an exemption from section 4 of the Act (i.e., family, hardships, etc.) which allows it to engage in activities that would otherwise be impermissible. Because of the variety of factors which must be considered, the examiner should exercise care when determining the permissibility of an activity for a bank holding company.

The subsections of this chapter present a *selected number* of those activities which have been determined to be impermissible for bank holding companies. While an activity is permissible only after it has been determined as such by the Board, it must be remembered that in determining permissibility, the Board has in some instances (i.e., data processing services, courier services, etc.) included restrictions which would limit the overall nature or performance of the activity. Therefore, even the permissible activities may become impermissible if the actions of the bank holding company are not in accordance with the stated restrictions.

The Board of Governors has ruled that land development[1] is impermissible for bank holding companies. However, for land acquired through foreclosure, a limited amount of development may be allowed in an effort to minimize the potential loss on the project. Each case must be considered separately to determine if it warrants additional development.

The basic determination of impermissibility was established by the Board in denying a portion of the application by UB Financial Corp., Phoenix, Arizona, to retain the H. S. Pickrell Company, Phoenix, Arizona (1972 FRB 429). The order stated in part, ‘‘The Board is of the opinion that the activities of purchasing and selling of land or participating as a joint venturer in real estate development are not so closely related to banking as to be a proper incident thereto, and that insofar as the application pertains to those activities, it should be denied.’’

The determination that limited development for land acquired through foreclosure is permissible is contained in a Board order dated November 1, 1973, in connection with an application by Liberty National Corporation, Oklahoma City, Oklahoma, to retain Liberty Mortgage Company, Oklahoma City, Oklahoma (1973 FRB 919), in which it is indicated that a limited amount of real estate development might be permissible if necessary to minimize losses on real estate acquired in connection with debts previously contracted.

1. The Board, by specific order, has permitted a limited incursion into this area as an accommodation to BHCs acquiring thrifts or to thrifts that qualify as ‘‘banks’’ and seek to form bank holding companies (1986 FRB 487, 731)

3700.2.1 PREMIUM FUNDING

Insurance premium funding, sometimes known as equity funding, is the financing of the sales of mutual fund shares and life insurance policies as a package. It should not be confused with loans made to an insured for the purpose of paying premiums on hazard insurance (insurance premium financing); in that case the lender may be named loss payee or owner of the policy and the lender has the right to submit the policy for cancellation in order to collect the amount owed. Insurance premium financing is a permissible activity pursuant to Section 225.25(b)(1) of Regulation Y (Refer to 1974 FRB 310).

The Board has determined insurance premium funding to be impermissible for bank holding companies (12 C.F.R. 225.126). This determination is based on the policies contained in sections 20, 21, and 32 of the Banking Act of 1933 (the Glass–Steagall Act Provisions) as described in the opinion of the United States Supreme Court in Investment Company Institute v. Camp, 401 U.S. 617 (1971).

''In the Board's opinion, the Glass–Steagall Act provisions, as interpreted by the U.S. Supreme Court, forbid a bank holding company to sponsor, organize or control a mutual fund'' (12 C.F.R. 225.125). In enacting the Glass–Steagall Act, Congress indicated that affiliations of commercial banks and securities companies give rise to a potential conflict of interest and unsound banking practices. Pursuant to section 4(c)(8) of the Act, the Board is required to consider whether the performance of a particular nonbank activity by a holding company produces benefits to the public that outweigh possible adverse effects, such as potential conflict of interest and unsound banking practices. Therefore, the potential conflict of interest and unsound banking practices arising in the affiliation of commercial banks and mutual funds precludes the Board from approving insurance premium funding as a permissible banking activity.

3700.2.2 LIFE INSURANCE UNDERWRITING

The life insurance discussed in this section is that life insurance which is not sold in connection with a credit transaction by a bank holding company or its subsidiary. The Board has ruled that this activity is impermissible for bank holding companies (12 C.F.R. 225.126). The Board developed its position during consideration of the application of First Oklahoma Bancorporation, Inc., Oklahoma City, Oklahoma, for prior approval pursuant to section 4(c)(8) of the Act to acquire sufficient additional shares of Underwriters Life Insurance Company, Oklahoma City, Oklahoma, so as to own at least 80 per cent of the outstanding shares and thereby to engage in the activity of underwriting life insurance not sold in connection with a credit transaction by a bank holding company or a subsidiary.

In acting on the First Oklahoma application, the Board relied on an earlier decision denying an application by Transamerica Corporation, San Francisco, California, to retain its shares of Occidental Life Insurance Company of California (1957 FRB 1014). In the Transamerica case, a hearing examiner found that the life insurance underwriting activities of Occidental were not so closely related to banking to be a proper incident to managing and controlling banks. In the First Oklahoma case, the application was presented on the question of whether the activities of Underwriters Life were so closely related to banking or managing or controlling banks as to be a proper incident thereto. The Board determined in First Oklahoma, that there was no reasonable basis for the contention that the activities of Underwriters Life were permissible.

The activity of acting as an underwriter (reinsurer) for credit life and credit accident and health (disability) insurance is, however, considered a permissible activity (12 C.F.R. 225.135).

3700.2.3 SALE OF LEVEL-TERM LIFE INSURANCE

The Board has stated that the sale of level-term life insurance is not covered by section 225.25(b)(8)(ii) of Regulation Y. This position was stated in its order approving the application by Fidelity Corporation of Pennsylvania, Rosemount, Pennsylvania, to acquire Local Finance Corporation, Providence, Rhode Island, excepting those proposed activities of level-term life insurance sales (1973 FRB 472). Insurance that does not decline in coverage as the outstanding loan balance is reduced results in the insured party carrying more insurance than is necessary to cover the outstanding loan balance. Because of this position, the Board would not allow the sale of this type of insurance by the applicant and its subsidiary.

3700.2.4 UNDERWRITING REAL ESTATE MORTGAGE GUARANTEE INSURANCE

Mortgage guaranty insurance is essentially a limited guarantee of a mortgage loan. Such insurance typically covers the top 20 or 25 percent of a mortgage loan. In the event of default by the borrower, the lender acquires title to the property and then submits a claim to the insurer. The insurer then has a choice of two options: (1) take title to the property and pay the lender the unpaid principal and interest; or (2) pay the lender the 20 or 25 percent insured portion of the loan, with the lender retaining title to the property.

The Board has determined that ''the underwriting of mortgage guarantee insurance is principally a credit determination, similar to those made by banks in their regular course of business'' (1974 FRB 727). Therefore, this activity is considered closely related to banking for purposes of permissibility under section 4(c)(8) of the Act. However, the Board noted that the private mortgage insurance industry was relatively young and still developing with a limited, untested, operating history. In addition, the Board believed that the times were such that it was ''desirable for bank holding companies generally to slow their present rate of expansion and direct their energies toward strong and efficient operations within their existing activities, rather than toward expansion into new activities'' (the go-slow policy), and, therefore, concluded that it would not be appropriate to adopt the underwriting of mortgage guarantee insurance as permissible for bank holding companies.

3700.2.5 UNDERWRITING PROPERTY AND CASUALTY INSURANCE

On May 12, 1978, the Board denied NCNB Corporation's application to retain its indirect subsidiaries, Superior Insurance Company and Superior Claim Service, both of Florence, North Carolina. These companies engaged, respectively in the activities of underwriting property and casualty insurance related to extensions of credit by NCNB's affiliates, in adjusting insurance claims and in appraising and valuing property in connection therewith. Neither of these activities had previously been determined by the Board to be closely related to banking. The Board concluded that the circumstances presented did not provide a reasonable basis for believing that the proposed activity was closely related to banking or managing and controlling banks (1978 FRB 506).

3700.2.6 TITLE INSURANCE

The Board issued a letter (See Board letter re Independence Bancorp, Inc., dated 3/17/86) to a bank holding company which filed an application with the Board to acquire a *de novo* title abstract company which planned to engage in, among other things, the sale of title insurance. The sale of title insurance had not been previously approved by the Board as a permissible nonbanking activity. In responding to the application, the Board determined that the proposed title insurance activities were not closely related to banking.

The Board's discretion to decide what types of insurance activities are closely related to banking was removed by the Garn–St Germain Depository Institutions Act of 1982 (''Garn Act''), which amended section 4(c)(8) of the BHC Act. The Garn Act stated that ''it is not closely related to banking or managing or controlling banks for a bank holding company to provide insurance as a principal, agent, or broker. . . .'' The Garn Act lists certain specific exceptions to this general prohibition, none of which permits the sale of title insurance. The Board thus concluded that the Garn Act does not allow it the discretion to approve this type of nonbanking activity.

3700.3.1 BROKERAGE

Real estate brokerage is the negotiating of a real estate contract between a buyer and seller for which the broker receives a fee or commission and in which the broker takes no possessory interest in the subject matter of the contract. The Board has stated that this activity is considered impermissible for bank holding companies. The Board's position was expressed in its order approving an application by Boatmen's Bancshares, Inc., St. Louis, Missouri, to acquire Williams, Kurrus and Company, St. Louis, Missouri (1972 FRB 428). The Board stated that it had determined that real estate brokerage activities were not so closely related to banking or managing or controlling banks as to be a proper incident thereto. Since Boatman's had not demonstrated to the Board's satisfaction that the real estate brokerage field activities are so closely related to banking or managing or controlling banks as to be a proper incident thereto, the Board approved the Boatman's application on the condition that Boatman's terminate its real estate brokerage activities.

3700.3.2 SYNDICATION

The Board ruled that this activity is not permissible for bank holding companies. The Board's position was developed during consideration of the application of BankAmerica Corporation, San Francisco, California, for prior Board approval to engage *de novo* under section 4(c)(8) of the Act in the activity of real estate syndication through a subsidiary, BankAmerica Realty Services, Inc., San Francisco, California. The Board concluded that the subsidiary's proposed activities of organizing, promoting, selling partnership interests, and acting as the sole general partner of real estate syndicates went beyond the functions performed by an advisory company to a real estate investment trust permissible under section 225.25(b)(4) of Regulation Y.

The Board also stated that it felt that the policies contained in sections 20 and 32 of the Banking Act of 1933 (the Glass–Steagall Act Provisions) must be considered in conjunction with section 4(c)(8) of the Act. These policies, described in the opinion of the United States Supreme Court in Investment Company Institute v. Camp, 401 U.S. 617 (1971), forbid a bank holding company to sponsor, organize or control an open-ended investment company (mutual fund) or a closed-end investment company primarily or frequently engaged in the issuance, sale and distribution of securities. Because the activities of real estate syndication resemble the issuance, sale and distribution of securities of a closed-end investment company, this activity is not permissible for a bank holding company (12 C.F.R. 225.125).

The Board has stated that general management consulting is not so closely related to banking or managing or controlling banks as to be a proper incident thereto. This ruling is contained in the Board's order denying the application of First Commerce Corporation, New Orleans, Louisiana, to acquire W. R. Smolkin & Associates, Inc., New Orleans, Louisiana. In its order the Board describes general management consulting as follows:

"... including, but not limited to, the provision of analysis or advice as to a firm's (i) purchasing operations, such as inventory control, sources of supply, and cost minimization subject to constraints; (ii) production operations, such as quality control, work measurement, product methods, scheduling shifts, time and motion studies, and safety standards; (iii) marketing operations, such as market testing, advertising programs, market development, packaging, and brand development; (iv) planning operations, such as demand and cost projections, plant location, program planning, corporate acquisitions and mergers, and determination of long-term and short-term goals; (v) personnel operations, such as recruitment, training, incentive programs, employee compensation, and management-personnel relations; (vi) internal operations, such as taxes, corporate organization, budgeting systems, budget control, data processing systems evaluation, and efficiency evaluation; or (vii) research operations, such as product development, basic research, and product design and innovation." (1972 FRB 674) The Board denied the case and determined that the activity of providing general management consulting services could lead to unwanted conflict of interest situations for BHCs that advised clients that were also customers of its own subsidiary banks. The Board also desired to maintain a distinct separation between banking and commerce.

In its order denying the application of Marine Midland Banks, Inc., Buffalo, New York, to acquire Carter H. Golembe Associates, Inc., Washington, D.C., the Board further defines the concept of management consulting by stating that Golembe, "... provides consulting services on a confidential basis to banks, bank holding companies and bankers' associations. It makes bank feasibility studies and renders advice with respect to geographic expansion, product extension, mergers and acquisitions and applications to State and federal regulatory agencies. A portion of Golembe's consulting services also relates to internal bank operations, such as marketing, trust and bank credit card operations and loan or interest rate policies. Other studies and analyses are performed upon request of individual banks. Golembe also provides advice with respect to the organization and operation of State Bankers' associations and serves as a consultant to various banking groups with respect to legislative and regulatory matters affecting the banking industry. The foregoing consulting services furnished by Golembe are considered by the Board to be but a specialized form of management consulting." (1972 FRB 676)

Management consulting to nonaffiliated commercial banks and nonbank depository institutions has been determined by the Board to be a permissible activity for bank holding companies under section 4(c)(8) of the Act (Regulation Y, section 225.25(b)11, as amended).

The Board has ruled that this activity is impermissible for bank holding companies. However, bank holding companies may conduct property management activities for three types of property as follows:

1. Property held in a fiduciary capacity;
2. Property owned by the holding company or its subsidiary for its own bank and bank-related operations;
3. Property acquired by the holding company or its subsidiary as a result of a default on a debt previously contracted.

The Board announced on June 30, 1972, that it would not include this general activity on the list of permissible activities. Because the Board did not intend to limit any authority given by statute or regulation to a holding company or its subsidiary concerning property management, the Board described in its order the three types of property, as shown above, for which a holding company or its subsidiary could engage in property management activities (1972 FRB 652).

In addition to the prohibition of property management activities in general, the Board has ruled that the operation of a commercial parking lot is impermissible. In its order approving the application by Multibank Financial Corporation, Boston, Massachusetts, to acquire the B. M. C. Durfee Trust Company, Fall River, Massachusetts, a commercial bank, the Board stated that operating a commercial parking lot was not considered closely related to banking and conditioned its approval on divestment of the parking lot operation (1973 FRB 679).

The Board through its rulemaking authority did not include operating a travel agency on the list of permissible activities for bank holding companies. This activity is considered not to be closely related to banking or managing or controlling banks (1976 FRB 148). The Board referenced a decision of the United States Court of Appeals for the District of Columbia, Courier Association vs. Board, 516 F. 2d 1229 (1975).

The Board felt the only relevant criteria for this activity was whether banks have generally provided the service. The Board noted that there were few bank-affiliated travel agencies, most of which had only been recently established. The Board concluded that operating a travel agency was not closely related to banking.

On June 1, 1978, the Comptroller of the Currency issued Banking Circular No. 108, which requested all national banks then operating travel agencies, to divest themselves of those agencies within a reasonable period of time not to exceed three years. The Comptroller's office concluded that the continued operation of a travel agency by a national bank is inappropriate and may expose the bank to a substantial risk of loss by litigation. This action by the Comptroller precludes bank holding companies from relying on section 4(c)(5) of the Act to conduct travel agencies. Thus, holding companies have no authority to engage in travel agency activities under the Act unless grandfathered.

On April 2, 1979, the Board issued a letter, a copy of which went directly to all bank holding companies engaging in the activity of operating a travel agency pursuant to section 4(c)(5) of the Act, indicating that no bank holding companies could engage in the activity solely pursuant to section 4(c)(5) and that those engaged in such activity had to terminate the activity by December 31, 1980 (Z–8421 on office copy only).

Subsequently, a bank holding company applied to the Board to acquire a company (''Company'') that engages in a variety of data processing and data transmission activities for customers. The Company's data bases that are provided to customers included a program by which customers could receive airline and hotel information and could make airline and hotel reservations. The Board determined that the receipt of such information and the ability to make airline and hotel reservations was not closely related to banking. Accordingly, the Board required, as a condition for approval of the application, the bank holding company to eliminate the travel reservation service from the roster of third party data base programs provided by Company (Refer to 1986 FRB 497).

As part of the Security Pacific Corporation's (bank holding company) application to acquire Duff & Phelps, Inc. (Company), which engaged in investment advisory, investment management, and financial advisory services, the Board, on December 11, 1984, denied the Applicant's request to engage in the activity of providing credit ratings on bonds, preferred stock and commercial paper. Private credit ratings were included as part of the investment research reports sold to institutional investors. The Company also provided credit ratings on a fee basis for companies that request public disclosure. As part of the public rating process, the rated company is given the opportunity to make a presentation to the Company's Credit Rating Committee.

In this situation, the Security Pacific Corporation had a vested interest in the ratings of the corporations to which it lends in the ratings of municipal bonds it underwrites, in the ratings of the commercial paper and municipal bonds for which it provides backup lines of credit, and in the ratings of fixed-income securities which it holds for trades. Numerous potential conflicts existed such as: possible inadvertent releases of confidential information obtained during the credit rating process; the advance release to the Applicant of credit ratings for companies to which the Applicant had very large loans outstanding; the potential for pressures by the Applicant on the Company to modify favorably the credit rating of one of the Applicant's major customers; and the subtle pressure on the Company's staff resulting from ownership by Applicant about companies in which the Applicant had a substantial interest. Similar conflicts could have also arisen between the Company's credit rating function and the Applicant's investment of trust assets.

The Applicant acknowledged the potential conflicts but argued that various steps could be taken to ameliorate them and bring them within a manageable framework. The Applicant therefore proposed a number of techniques for isolating the credit rating activities of the Company from influence by the Applicant, including the establishment of a separate corporation with a number of independent directors, a prohibition on contacts between the Applicant and the members of the Company's Credit Rating Committee, and also certain record keeping requirements for that committee.

The Board considered these positive suggestions as well as others to assure full disclosure of the relationships between the Applicant and any of the companies that would be rated by the Company as well as a prohibition on the Company rating the Applicant's securities, securities which the Applicant has underwritten, or securities for which the Applicant provided a guarantee or backup letter of credit. The Board, however, believed that the conflicts in the relationship between a major lender and a credit rating company were so pervasive that they could not be overcome through adoption of an information barrier. The employees of the Company would inevitably be aware of interests of the Applicant in firms being rated by them and, it seems reasonable to assume that this knowledge could, at times, influence their decisions.

The Board's concerns regarding conflicts of interest with respect to the credit rating activity were not based on any doubts regarding the integrity of the parties to the application, but rather were based on the Board's responsibility to assess the possible adverse effects that might be associated with an affiliation between a bank holding company and a public credit rating organization. Thus the Board was acting in furtherance of one of the general purposes of the Bank Holding Company Act, "to prevent possible future problems rather than to solve existing ones." The Board, in view of the pervasive conflicts of interest between the Applicant's existing operations and the Company's credit rating business, decided against approving the performance of public credit ratings.

Currency options are a new and innovative aspect of foreign exchange. A currency option represents the contractual right (but not the obligation) to purchase or sell a predetermined amount of currency at a specific price at any time before a specific date. Currency-options advocates argue that currency options eliminate the risk of a loss due to exchange movements and give the holder a chance to profit if the currency fluctuation is favorable. They require a premium to be paid when the contract is entered into. The premiums can run from about 1.5 percent to 5 percent, depending on the expiration date and the exercise price of the option.

Currency options are traded on two types of markets: the over-the-counter, or interbank market, and on three regulated exchanges, the Chicago Mercantile Exchange (CME), the Chicago Board Options Exchange (CBOE), and the Philadelphia Exchange (PHLX). The CBOE, a securities exchange, uses multiple ‘‘market makers’’ instead of specialist positions; the CME, a commodities exchange, like other commodities exchanges, does not use specialist positions.

Most of the writing of currency options is currently done by banks which will customize the option, with maturity dates and currency values in excess of the standardized exchange contracts. Banks developed the over-the-counter market where they trade currency options among themselves, and banks are also the largest customers on the exchanges where they hedge the risks associated with their foreign-exchange positions.

In general, the specialist system is unique to securities exchanges, and specialists exist for the purpose of achieving certain market results. Commodity exchanges do not use the services of specialists. The rules of the Securities and Exchange Commission permit the designation of specialists to ‘‘engage in a course of dealings for . . . their . . . own account to assist in the maintenance, so far as practicable, of a fair and orderly market . . .’’ provided that the securities exchanges adopt the following types of rules governing specialists: minimum capital requirements, rules to suspend or remove specialists if they fail to perform their designated market functions, rules restricting dealing activities to those reasonably necessary to permit the specialist to maintain a fair and orderly market or necessary to permit him or her to act as an odd-lot dealer, provisions governing his or her brokerage activities in specialist securities, and procedures to provide for the effective and systematic surveillance of the activities of specialists (17 C.F.R. 240.11(b)(1)). In addition, the IRS formerly granted special tax treatment to specialists transactions.

The rules of the PHLX require that odd-lot orders must be given to the specialist. The specialist functions as a broker with respect to certain transactions that cannot be executed by floor traders immediately, for example, stop-loss orders and limit orders. All such orders are given to the specialist for execution and become part of his ‘‘book’’; PHLX rules address priority of orders (customers’ orders receive priority) and conflicts of interest by governing specialists’ trades and those of affiliated persons and firms in ‘‘securities’’ in which the person is designated as specialist.

There is one specialist position for each currency option traded on the PHLX, and the primary function of a specialist is to act as market maker, as necessary, for its assigned currency option. The specialist thus undertakes all activity, including dealing for its own account, to the extent necessary, as required to maintain a fair and orderly market in options on a particular currency. In essence, the specialist makes a continuous two-sided market in the assigned currency option when market forces do not.

Although currency options are functionally equivalent to other instruments which banks regularly deal in for their own account, the applicant’s proposed activities were not considered as closely related to banking. The applicant’s analysis did not focus on the critical components of the proposed specialist activities, which are distinct from the foreign-exchange brokerage and dealing activities generally conducted by banks. Because the proposed specialist activities are to be carried out in the context of market making on a regulated exchange, they were significantly different from the foreign-exchange activities currently conducted by banks. When a bank engages in foreign-exchange trading, it does so to service the needs of its customers and to generate trading profits. However, unlike traditional foreign-exchange trading, bank customers are not serviced directly by a specialist. Instead, the exchange benefits from the specialist’s efforts if markets are perceived to be deep and liquid. Depth and liquidity make the contracts viable and the exchange profitable, and do not directly benefit the bank’s customers.

The applicant’s original proposal implicitly acknowledged that banks have not traditionally been involved with trading on stock exchanges, and thus have not generally possessed the experience and expertise in trading, hedging, and managing aggregate exposure required for the successful operation of a specialist position. The applicants originally proposed to engage in the activities through a joint venture because they lacked the requisite trading expertise to profitably undertake the activity alone. In its discussion of the management of risk exposure of the specialist, the applicants originally stated, ‘‘The choice of the appropriate hedge to start with and the monitoring over the life of the option of that hedge are specialized and difficult tasks that require expertise and experience.’’ Conducting exchange specialist activities requires the floor-trading experience and back-office capabilities of an experienced exchange member.

As of December 1984, only one commercial bank, Bank of America, acted as a specialist in exchange-traded currency options. In January 1984, the Office of the Comptroller of the Currency granted permission for Bank of America to act as the specialist in PHLX-traded options on the Deutschemark through a joint venture subsidiary with Tague Securities Corporation. The Board, however, was not bound to a determination that specialist activities were closely related to banking simply because one bank engages in the activity. Bank of America apparently considered it necessary to conduct its specialist activity through a joint venture with a securities firm, which reinforced the view that the activity requires experience and expertise not generally possessed by banks.

Given the applicant’s acknowledgment of the importance of floor-trading expertise and experience to the specialist function, and the substantive absence of bank involvement in such an activity, the Board concluded that the proposed activities were not closely related to banking and thus denied the applicant’s request.

A bank holding company applied to acquire all the voting shares of a company (''Company'') that engages in a variety of data processing and data transmission activities for customers such as securities and commodities exchanges, brokerage firms, commercial banks, savings and loan associations, insurance companies, and investment managers. In addition to engaging in other nonbanking activities, the company designs and assembles the hardware that is used in connection with the services it provides. The Board had not previously considered whether the assembly of hardware designed for the processing and transmission of banking, financial and economic data is closely related to banking or permissible as an incidental activity.

The bank holding company stated that Company's assembly of hardware was incidental to its provision of data processing services because such assembly was necessary to assure the availability, reliability, and quality of components used by Company, and that stock quotation firms like Company could only assure such product characteristics by the design and assembly of the hardware that provides the quotation information. In support of the argument, the bank holding company asserted that competitors of Company also design and assemble the hardware that provides the Company service.

In view of the fact that finished hardware of the type provided by Company is available, and, in fact, is marketed by companies providing services similar to Company, the Board found that the continuation of Company's design and assembly of hardware activities could not be considered ''necessary'' to the Company's provision of its permissible data processing services, and thus could not be considered incidental to Company's provision of permissible services. As a condition for approval of the bank holding company's application to acquire all of the voting shares of Company, the Board required the bank holding company to divest of Company's hardware assembly activities within two years of the acquisition (Refer to 1986 FRB 497).

In 1971 and again in 1984, the Board issued for public comment proposals to expand the activities permissible to bank holding companies under section 4(c)(8). Included in those proposals was the provision of armored car services. The proposals would have authorized bank holding companies to provide fully insured transportation of cash, securities, and valuables (primarily between commercial customers and financial institutions) and such ancillary services as coin wrapping, change delivery, mail delivery, payroll-check cashing, servicing of automatic teller machines, and leasing safes to commercial customers.

In response to both the 1971 and 1984 proposals, the Board received various comments against adding this activity to the Regulation Y list of permissible nonbanking activities, primarily from armored car operators and their trade associations. The commenters maintained that the activity is not closely related to banking but, rather, is essentially a transportation activity requiring no banking expertise.

In view of the issues raised by the comments on this activity and the minimal interest by bank holding companies, the Board decided not to add the activity to the Regulation Y list of permissible activities. However, the Board stated it would consider individual applications for this activity (1973 FRB 898); 51 *Federal Register* 39,999 (1986). The Board expressed no opinion as to whether the activity would meet the *National Courier* test and would be a proper incident to banking.

In 1988, a bank holding company (the applicant) filed an application to engage in armored car activities through a de novo nonbank subsidiary. After notice of the application was published, the Board received comments opposing the proposal and was requested to order a formal hearing. In response, the Board published an order requiring a formal public administrative hearing on the application. One issue, among others, that the Board directed to be considered was whether the proposed armored car services were ‘‘so closely related to banking or managing or controlling banks as to be a proper incident thereto’’ under section 4(c)(8) of the BHC Act.

An administrative hearing was held on June 16 and July 11, 1989, before an administrative law judge (ALJ). The ALJ issued a recommended decision in which he concluded that the proposed armored car activities were not ‘‘closely related to banking’’ and recommended that the Board deny the application. The ALJ found that none of the *National Courier* criteria were demonstrated by the record. The ALJ's conclusion relied on certain operational distinctions between the proposed armored car services and the services banks traditionally perform themselves.

Following receipt of exceptions to the recommended decision, the Board reviewed the entire record of the proceedings and determined that the ALJ had erred in concluding that armored car services were not ‘‘closely related to banking.’’ The Board concluded that, even accepting the factual findings, the slight operational distinctions cited in the recommended decision were not significant. The Board found that although there may be some distinctions between bank-provided armored car services and the proposed full-service, for-hire armored car service, the nature of the customers served and the economic basis of the services provided do not fundamentally alter the nature of the services. It was therefore clear to the Board that the services then provided by the applicant as well as other banks and bank holding companies to themselves and their customers are sufficiently ‘‘operationally and functionally similar’’ to the proposed service as to equip banking organizations particularly well to perform the proposed service, and hence fulfill the second *National Courier* test.

The Board also noted that bank holding companies are permitted to provide courier services for unaffiliated parties under section 225.25(b)(10) of Regulation Y. The only essential difference between the two services relates to the intrinsic value of the materials transported. The Board concluded that the services themselves were certainly functionally and operationally similar, thereby lending additional support to its favorable finding under the second *National Courier* test.

The Board also found that the third *National Courier* test was met, that the applicant had demonstrated ‘‘the dependence of banks on a specialized form of the proposed services.’’ The Board found that the record amply demonstrated that banks are highly dependent upon the specialized transportation services provided by armored cars, which transport cash and valuables with a high degree of security. The applicant was proposing to engage in just those specialized services; it did not propose to start a general moving or trucking service. The record therefore supported a determination that the third *National Courier* test was also satisfied. Accordingly, the Board found, based on the record before it, that providing for-hire armored car services to the general public was an activity that is closely related to banking.

This determination, however, is only one of two steps needed for the Board to approve a nonbank activity for a bank holding company. The Board must also find that the activity is a ‘‘proper incident thereto.’’ On this issue, the ALJ declined to make any factual or legal determinations concerning the proper-incident test or state branching laws. However, under the Board's rules (12 C.F.R. 262.4 (1990)), the ALJ was required to provide a recommended decision with regard to *all* unresolved issues prior to a final Board determination (12 C.F.R. 263.11). A final disposition on the application therefore was not possible at that juncture, and the Board remanded the case to the ALJ for a recommended decision on the proper-incident standard and other unresolved issues (see 1990 FRB 676).

In accordance with the Board's remand order, a second formal hearing was held before the ALJ. Additional evidence and post-hearing briefs were submitted, including evidence on the proper-incident test, in support of this and other unresolved issues. The ALJ then issued his supplemental decision, which again recommended denial of the application. The ALJ found that, in this case, the applicant's record failed to provide a definitive proposal on which the Board could make a determination under the proper-incident test. The ALJ found that the applicant had offered only a skeletal structure and operation plan that was fleshed out only to a limited extent at the hearings. In addition, the ALJ found the application and other facts of record to be deficient with regard to possible public benefits and adverse effects. The ALJ further determined that the record had not shown that the proposed activity, as structured, would be lawful under the branch-banking laws of the states in which the applicant proposed to operate.

Based on its review of the ALJ's supplemental decision and the remainder of the record, the Board determined that the record failed to support a finding that the proposed armored car activities, in this particular instance, would be a ‘‘proper incident’’ to banking. The Board therefore adopted the ALJ's recommendation to deny the application, but only on the narrow grounds of inconsistency of the proposal, as then structured, with section 23B of the Federal Reserve Act.

In its order, the Board stressed that the burden of proof is upon an applicant to establish that the nonbanking activity it proposes to conduct—in this case the provision of armored car services—is *not only* closely related to banking, *but also* a ‘‘proper incident thereto.’’ The Board's review of the entire proceeding disclosed certain aspects of the application that appeared on its face to violate the arm's-length transaction requirement of section FRA 23B. In the Board's view, a proposal to engage in nonbanking activities pursuant to section 4(c)(8) will not produce net benefits to the public, as required under the public-benefit test, if it violates the kind of statutory requirement, such as section 23B, that was specifically intended to prevent unsafe or unsound banking practices when a bank affiliate engages in nonbanking activities.

The first potential violation would arise from the fact that the proposed service by the bank holding company's nonbank subsidiary to its bank affiliate would cost more than the bank was paying for similar armored car services provided by an unaffiliated provider. The Board noted that although there may be a justification for the higher pricing structure that would meet the standards set forth in section 23B, no justification appeared in the record. The Board could therefore only conclude that the bank may not be obtaining services from the nonbank provider ‘‘on terms . . . at least as favorable to such bank . . . as those prevailing for comparable transactions with or involving other nonaffiliated companies,’’ as required by section 23B.

The second potential violation of section 23B arose from the absence of a ‘‘precise breakdown of the services the nonbank subsidiary will purchase from the bank holding company's subsidiary bank and the projected cost of those services,’’ as called for in the Board's prior order in this matter. The applicant provided no detailed cost figures for the wide variety of services the applicant's banking subsidiary was to provide to the nonbank subsidiary. The bank holding company proposed to charge the bank subsidiary an ‘‘estimated’’ percentage (the fee was admitted to have had no ‘‘factual basis’’ reflected in the record) of the nonbank subsidiary's direct operating expenses to cover all of the services provided by the bank holding company's banking subsidiary to its nonbanking subsidiary. Under section 23B, the provision of services by a bank to an affiliate must be paid for on an arm's-length basis. This requires, where there are no comparable transactions between a bank and a nonaffiliate, that the bank's provision of services to its affiliate be on terms that in good faith would be offered to, or would apply to, nonaffiliated companies. The Board found that the banking subsidiary would not in good faith have provided back-office services to an unaffiliated armored car company by charging a flat fee that had no factual basis and without determining the relationship of the fee to the actual costs of providing the services. Therefore, the potential violations of section 23B, on their face, constrained the Board to deny the application as it was structured (see 1993 FRB 352).

The Board noted its denial did not affect the Board's prior ruling in the case that armored car services are closely related to banking, and was without prejudice to the filing of a new proposal from which a favorable proper-incident finding could be made.

Impermissible Activities (Computer Output Microfilm Service) Section 3700.11

The authority of bank holding companies under section 225.25(b) of the Board's Regulation Y to engage in data processing activities is intended to limit those activities to providing facilities that perform banking functions, such as check collection, or other similar functions for customers that are depository or other similar institutions, such as mortgage companies. With respect to this activity, the Board issued an interpretation that authorizes bank holding companies to provide the formatting for computer output microfilm only as an output option for data otherwise permissibly processed by the holding company system (1982 FRB 552).

A foreign banking organization subject to the BHC Act applied for the Board's approval under section 4(c)(8) to engage *de novo* through its subsidiary (Company), in the exchange and clearance of: (1) exchange traded securities options and other securities and (2) futures and options on futures that relate to financial instruments. The proposed customer base was comprised primarily of market makers and other professional floor traders dealing for their own accounts. Most of the professional traders were expected to be market makers and specialists, including individuals, small partnerships, or small corporations, that were to trade primarily on the Chicago Board of Options Exchange (CBOE).[1]

Previously, the Board approved the execution and clearance of financial instruments as a permissible nonbanking activity.[2] Under Board precedent, the nonbanking subsidiary engaged in such services has generally serviced a broad range of retail and/or institutional customers. Under this proposal, Company was to clear trades for a specialized customer base comprised primarily of professional floor traders that executed trades for their own accounts.

Nonbanking subsidiaries of BHCs, operating in accordance with prior Board approvals, have generally performed both execution and clearance services. By performing both services, the nonbank subsidiary is able to control risk because it executes the majority of the transactions that it clears. The nonbank subsidiary can refuse to execute an order that it deems inappropriate or it can require additional funds or collateral from the customer *in advance of* and as a condition to executing the transaction.

Unlike prior Board cases, Company plans to provide primarily clearing services. As a clearing agent, it would guarantee the financial performance of its customers to the clearing organization of the exchanges on which it operates.[3]

After the start of trading on any day, Company would be obligated to settle each trade entered into by its customers even when the customer may not have the financial resources to honor its obligation. Since the trades have already been executed by the time that they would be presented to Company by these professional floor traders, Company would be unable to decline transactions that posed unacceptable risk. On an intraday basis, professional traders, who are not employees of Company and who trade in relatively volatile instruments, could expose Company to financial risks beyond the trader's capacity to repay and beyond Company's own resources.

The applicants proposed to limit the risk exposure created by Company's activities through the establishment of risk guidelines and procedures that were intended to monitor the intraday trading activities of its floor traders. No such system had been developed for the industry for monitoring the intraday activities of floor traders on a real-time basis. Most of Company's traders would primarily operate on exchanges that used an open outcry system rather than an electronic trading system. As a result, Company may not know its real-time committed positions until the end of the trading day and therefore the possibility existed that a floor trader could exceed Company's risk limits and incur substantial losses before Company could act to mitigate its credit risk exposure. Professional floor traders generally operate with much higher levels of leverage than the average brokerage customer of a securities firm. Since most of Company's customers were to be market makers, such traders could at times take positions contrary to the market.

1. Market makers on the CBOE are floor traders that perform a dealer function by trading for their own accounts, at their own risk, and for their own profit. Market makers compete with other market makers assigned to the same class of options. In contrast, floor brokers on the CBOE generally act only as an agent, executing customer and firm proprietary orders.

2. Refer to sections 225.25(b)(3) (trust companies engaging in agency activities related to the clearing of securities); 225.25(b)(15) (securities brokerage activities); 225.25(b)(18) (execution and clearance of futures and options on futures) of the Board's Regulation Y.

3. With this arrangement clearing firms may also be liable for the obligations of other members of the exchange. Generally, losses of a failed member firm are covered in the following order:

1. by the assets of the failed firm;
2. by the excess capital of the clearing organization;
3. by the guarantee fund of the clearing organization; and
4. by direct assessments made on surviving member firms.

Since member clearing firms are the ultimate source of capital for both the clearing association and the guarantee fund, the surviving firms will bear the ultimate burden of any loss.

Such circumstances potentially expose the clearing firms to substantial losses. If the clearing firm exhausts all or most of its capital in funding the obligations of floor traders that have lost substantial amounts of money in trading, parent companies of the clearing firm may have to cover the firm's remaining contingent liabilities. Such risks may be acceptable for some nonbanking institutions currently providing these services, but they may be inappropriate for U.S. domiciled banking organizations.

The Board carefully considered the benefits of the proposal, including the Applicants entry into a concentrated market, its experience with similar activities on foreign exchanges, and Company's proposed risk management systems. The Board concluded that the proposal, as it was currently structured (including the absence of an effective means to monitor and limit the potential credit risk exposure to the parent bank holding company) involved potential adverse effects that outweighed the potential public benefits. The Board thus determined that the balance of public interest factors that it is required to consider under section 4(c)(8) of the BHC Act were not favorable. The application was denied by the Board on January 9, 1991 (1991 FRB 189).

The Gramm-Leach-Bliley Act (the GLB Act) became effective on March 11, 2000. The GLB Act authorized affiliations among banks, securities firms, insurance firms, and other financial companies. To further this goal, the GLB Act amended section 4 of the BHC Act to allow a bank holding company (BHC) or foreign bank that qualifies as a financial holding company (FHC) to engage in a broad range of activities that (1) the GLB Act defines as financial in nature or incidental to a financial activity, or (2) the Board, in consultation with the Secretary of the Treasury, determines to be financial in nature or incidental to a financial activity. Furthermore, section 4 of the BHC Act authorizes an FHC to engage in designated financial activities, including insurance and securities underwriting and agency activities, merchant banking, and insurance company portfolio investment activities.

The GLB Act includes conditions that must be met for a BHC or a foreign bank to be deemed a ''financial holding company'' and engage in expanded activities. The GLB Act also allows an FHC to seek Board approval to engage in any activity that the Board determines (1) is complementary to a financial activity and (2) does not pose a substantial risk to the safety and soundness of depository institutions or the financial system generally. BHCs that do not qualify as FHCs are limited to engaging in those nonbanking activities that were permissible under section 4(c)(8) of the BHC Act before enactment of the GLB Act.

The GLB Act provides that, in most cases, an FHC may engage in or acquire the shares of a company that is engaged in financial activities without obtaining prior approval from the Board. An FHC is instead required to provide a *post-commencement* notice to the Board within 30 days after commencing a financial activity or acquiring a company. See section 4(k) of the BHC Act. Prior approval from the Board is required to acquire or engage in the activities of a savings association.

3900.0.1 FHC SUPERVISORY OVERSIGHT AUTHORITY

Under the GLB Act, the Federal Reserve has supervisory oversight authority and responsibility for BHCs, including BHCs that operate as FHCs. The GLB Act sets forth parameters for operating relationships between the Federal Reserve and other regulators. The statute differentiates between the Federal Reserve's relations with (1) depository institution regulators and (2) functional regulators, which include insurance, securities, and commodities regulators. There should be minimal, if any, noticeable change in the well-established relationships between the Federal Reserve as BHC (including FHC) supervisor and the bank and thrift supervisors (federal and state). The Federal Reserve's relationships with functional regulators will, in practice, depend on the extent to which an FHC is engaged in functionally regulated activities; those relationships will also be influenced by existing working arrangements.

The Federal Reserve's supervisory oversight role is that of an umbrella supervisor concentrating on a consolidated or group-wide analysis of an organization. Umbrella supervision is not an extension of more traditional bank-like supervision throughout an FHC. The FHC framework is consistent with and incorporates principles that are well established for BHCs. The FHC supervisory policy focuses on addressing supervisory practice for and relationships with FHCs, particularly those that are engaged in securities or insurance activities. See SR-00-13.

3900.0.2 ROLES OF SUPERVISORS

The Federal Reserve is responsible for the consolidated supervision of FHCs. In this regard, the Federal Reserve will assess the holding company on a consolidated or group-wide basis with the objective of ensuring that the holding company does not threaten the viability of its depository institution subsidiaries. The manner in which the Federal Reserve fulfills this role will likely evolve along with the activities and structure of FHCs, and it may differ depending on the mix of banking, securities, and insurance activities of an FHC.

Depository institution subsidiaries of FHCs are supervised by their appropriate primary bank or thrift supervisor (federal and state). The GLB Act did not alter the role of the Federal Reserve, as holding company supervisor, vis-a-vis the primary supervisors of FHC-associated bank and thrift subsidiaries. Traditionally, the Federal Reserve has relied to the fullest extent possible on those supervisors.

Nonbank (or nonthrift) subsidiaries engaged in securities, commodities, or insurance activities are supervised by their appropriate functional regulators. Such functionally regulated subsidiaries include a broker, dealer, investment adviser, and investment company registered with and regulated by the Securities and Exchange Commission (SEC) (or, in the case of an investment adviser, registered with any state); an insurance company or insurance agent subject to supervision by a state insurance regulator; and a nonbank subsidiary engaged in activities regulated by the Commodity Futures Trading Commission (CFTC).

3900.0.3 FHC SUPERVISION OBJECTIVES

The Federal Reserve, as umbrella supervisor, will seek to determine that FHCs are operated in a safe and sound manner so that their financial condition does not threaten the viability of affiliated depository institutions. Oversight of FHCs (particularly those engaged in a broad range of financial activities) at the consolidated level is important because the risks associated with those activities can cut across legal entities and business lines. The purpose of FHC supervision is to identify and evaluate, on a consolidated or group-wide basis, the significant risks that exist in a diversified holding company to assess how these risks might affect the safety and soundness of depository institution subsidiaries.

Accordingly, the Federal Reserve will focus on the financial strength and stability of FHCs, their consolidated risk-management processes, and overall capital adequacy. The Federal Reserve will review and assess the internal policies, reports, and procedures and the effectiveness of the FHC consolidated risk-management process. The appropriate bank, thrift, or functional regulator will continue to have primary responsibility for evaluating risks, hedging, and risk management at the legal-entity level for the entity or entities that it supervises.

FHC supervision is not intended to impose bank-like supervision on FHCs, nor is it intended to duplicate or replace supervision by the primary bank, thrift, or functional regulators of FHC subsidiaries. Rather, FHC supervision seeks to protect the depository institution subsidiaries of increasingly complex organizations with significant interrelated activities and risks, while not imposing an unduly duplicative or onerous burden on the subsidiaries of the organization. Effective financial holding company supervision requires—

1. strong, cooperative relationships between the Federal Reserve and primary bank, thrift, and functional regulators and foreign supervisors (these relationships respect the individual statutory authorities and responsibilities of the respective supervisors, but also allow for enhanced information flows and coordination so that individual responsibilities can be carried out effectively without creating duplication or excessive burden);
2. substantial reliance by the Federal Reserve on reports filed with or prepared by bank, thrift, and functional regulators, as well as on publicly available information for both regulated and nonregulated subsidiaries; and
3. continued reliance on the risk-focused supervision and examination process and on market discipline.

3900.0.4 FHC SUPERVISION IN PRACTICE

The supervisory activities of the Federal Reserve fall into three broad categories: (1) information gathering, assessments, and supervisory cooperation; (2) ongoing supervision; and (3) promotion of sound practices and improved disclosure.

3900.0.4.1 Information Gathering, Assessments, and Supervisory Cooperation

To fulfill its GLB Act responsibilities, the Federal Reserve needs to interact closely and exchange information with the primary bank, thrift, and functional regulators. The Federal Reserve will foster strong relationships with senior management and the boards of directors of FHCs, and have access to timely information from FHCs. These relationships will need to include heads of significant business lines and key internal-audit, control, and risk-management officials in order to understand how risk-management and internal-control policies and procedures established at the consolidated level are being implemented and assessed. To achieve these objectives, Federal Reserve supervisory staff will take the following actions:

1. *Regularly assess an FHC's centralized risk-management and control processes.* Such assessments are necessary to understand an organization's overall risk profile, identify

material contributions to core risks, and determine how such risks are being managed and controlled on a consolidated basis.
2. *Perform limited, targeted transaction testing.* The purpose of this transaction testing is to verify that the risk-management systems of the FHC are adequately and appropriately measuring and managing areas of risk for the organization, and to confirm that laws and regulations applicable to the FHC and within the jurisdiction of the Federal Reserve are being observed.
3. *Have periodic discussions with FHC senior management and boards of directors.* Such discussions will enable the Federal Reserve to build relationships with key personnel and to understand changing activities and the evolving risk profile of the consolidated organization. Periodic discussions also will provide a forum for supervisory staff to present any findings or concerns related to the activities of the group as a whole or to business lines that cut across legal entities.
4. *Have periodic discussions with key personnel.* Discussions will be held with the personnel responsible for corporate management and control functions, such as heads of business lines, risk management, internal audit, and internal control.

When performing the above tasks, Federal Reserve supervisory staff, to the extent possible, will coordinate their actions with those of the primary bank, thrift, and functional regulators of the FHC's subsidiaries. For example, to understand the risks and risk-management systems of an FHC at the consolidated level, the Federal Reserve will need information concerning assets or liabilities booked in significant bank, thrift, and functionally regulated subsidiaries within the FHC group. The primary bank, thrift, and functional regulators of such subsidiaries also may need information from the FHC to perform their respective statutory mandates. To assist in sharing needed information, Federal Reserve supervisory staff should do the following:

1. *Have periodic meetings with the primary bank, thrift, and functional regulators of an FHC's subsidiaries.* The purpose of these meetings is to develop an understanding of the risk profiles of the individual regulated legal entities and their relation to the FHC's overall risk profile. These meetings also should be used, when appropriate, to share information regarding supervisory plans and to coordinate supervisory activities and follow-up, as needed.
2. *Review the examination findings of primary bank, thrift, and functional regulators (and their self-regulatory organizations) together with other relevant information.* The purpose of this review is to develop a consolidated picture of the FHC's financial condition and risk profile, the effectiveness of risk-management and internal-control policies, and the implications for the affiliated depository institutions.
3. *Make available to primary bank, thrift, and functional regulators, to the extent permissible, pertinent information regarding the FHC.* Included is information on the financial condition, risk-management policies, and operations of an FHC that may have a material impact on individual regulated subsidiaries, as well as information concerning transactions or relationships between the regulated subsidiaries and other subsidiaries within the FHC group. This process will assist supervisors in performing their statutory and supervisory responsibilities over regulated subsidiaries.
4. *Participate in the sharing of information among international supervisors, consistent with applicable law.* The purpose of this exchange is to ensure that an FHC's global activities are supervised on a consolidated basis and to minimize material gaps in supervision.
5. *Review internal-audit and management reports and publicly available information (including market information on equity and debt prices of the consolidated organization), as well as reports and statistics collected by other regulators, including regulators of depository institution subsidiaries.* To limit regulatory burden, this information should be obtained, to the fullest extent possible, from (1) the parent organization; (2) primary bank, thrift, and functional regulators of the FHC's regulated subsidiaries; and (3) publicly available sources, such as externally audited financial statements.

3900.0.4.2 Ongoing Supervision

3900.0.4.2.1 FHC Structure, Management, and the Applications Process

The Federal Reserve is responsible for understanding the consolidated organization's legal, organizational, and risk-management structure; major business activities; and risk exposures and risk-management systems. The Federal Reserve needs to understand the nature and degree of involvement of the board of directors in overseeing their organization's risk-management and control process at the consolidated group level. The Federal Reserve, when considering any formal application, declaration, or notification at the FHC level, will coordinate, as appropriate, with primary bank, thrift, and functional regulators.

3900.0.4.2.2 Reporting and Examination

The Federal Reserve will rely, to the fullest extent possible, on reports that an FHC or its subsidiaries are required to file with federal or state authorities (or self-regulatory organizations) or on reports that are prepared by the federal or state authorities. The Federal Reserve will rely on routinely prepared management reports, publicly reported information, and externally audited financial statements. The Federal Reserve also will rely to the fullest extent possible on the examination of an FHC's bank and nonbank subsidiaries by their appropriate primary bank, thrift, and functional regulators (and their self-regulatory organizations).

If supervisory staff requires a specialized report from a functionally regulated subsidiary of an FHC, staff will first request it from the subsidiary's appropriate functional regulator. In the event that the report is not made available to the Federal Reserve, supervisory staff may obtain the report directly from the functionally regulated subsidiary if it is necessary to assess—

1. a material risk to the FHC or any of its depository institution subsidiaries;
2. compliance with any federal law that the Federal Reserve has specific jurisdiction to enforce against the FHC or a subsidiary; or
3. the FHC's systems for monitoring and controlling financial and operational risks that may pose a safety-and-soundness threat to a depository institution subsidiary.

The Federal Reserve may examine a functionally regulated subsidiary under certain circumstances. Before examining a functionally regulated subsidiary, supervisory staff should first seek to obtain the necessary information from the appropriate functional regulator. If an examination is determined to be necessary, the Federal Reserve should coordinate its actions with the appropriate functional regulator. An examination may be conducted when the Federal Reserve has reasonable cause to believe (or reasonably determines) that—

1. the subsidiary is engaged in an activity that poses a material risk to an affiliated depository institution,
2. the examination is necessary to be adequately informed about the FHC's systems for monitoring and controlling the financial and operational risks that may pose a safety-and-soundness risk to a depository institution subsidiary; or
3. the subsidiary is not in compliance with any federal law that the Board has specific jurisdiction to enforce (and the Board cannot determine compliance by examining the FHC or its affiliated depository institutions).

The Federal Reserve, consistent with its current practice, will continue relying to the fullest extent possible on the work performed by bank, thrift, and functional regulators to validate that material risks are measured and managed adequately at the regulated subsidiary level. Where necessary and appropriate, and consistent with (1) through (3) immediately above, the Federal Reserve may conduct or participate in reviews at banks, thrifts, or functionally regulated subsidiaries to validate that risk-management and internal-control policies established at the consolidated level are being implemented effectively.

For an FHC subsidiary that is not supervised by a bank, thrift, or functional regulator, the Federal Reserve will obtain information from the subsidiary, as appropriate and necessary, to assess the financial condition of the FHC as a whole. In addition, the Federal Reserve will conduct examinations of such subsidiaries, if necessary, to be informed about (1) the nature of the subsidiary's operations and financial condition, (2) the subsidiary's financial and operational risks that may pose a threat to the safety and soundness of any depository institution subsidiary of the FHC, and (3) the systems for monitoring and controlling such risks. Under the GLB Act, the Federal Reserve may not examine any subsidiary of an FHC that is an investment company registered with the SEC and that is not itself a BHC.

3900.0.4.2.3 Capital Adequacy

The Federal Reserve is responsible for assessing consolidated capital adequacy for FHCs, with the ultimate objective of protecting the insured depository subsidiaries from the effects of disruptions in the nonbank portions of the organization. Capital adequacy will be assessed in relation to the risk profile of the consolidated organization. The Federal Reserve will review the FHC's internal risk assessment and related capital-analysis process for determining the adequacy of its overall capital position. Such a review will include consideration of current and future economic conditions, business-development plans for the future, possible stress scenarios, and internal risk-control and audit procedures. As BHCs, FHCs are subject to the Federal Reserve's holding company capital guidelines, which set forth minimum capital ratios that serve as tripwires for additional supervisory scrutiny and corrective action. The Federal Reserve will review these requirements as they apply to FHCs and may, if warranted, adapt the manner in which they apply to FHCs that engage in a broad range of financial activities.

Although the Federal Reserve is responsible for assessing the consolidated capital adequacy of FHCs, the primary bank, thrift, or functional regulators of FHC subsidiaries will continue to set and enforce applicable capital requirements for the regulated entities within their jurisdiction. Under the GLB Act, the Federal Reserve may not establish separate capital adequacy requirements for an FHC subsidiary that is in compliance with the capital requirements of its functional regulator.

Consistent with current practice, the Federal Reserve will continue to place significant reliance on the primary bank, thrift, or functional regulator's analysis of the capital adequacy of a regulated subsidiary. That analysis will be a significant input in the Federal Reserve's assessment of an FHC's consolidated capital adequacy, especially when a securities broker-dealer or insurance company is a predominant part of an FHC.

Several issues become particularly important when assessing the consolidated capital adequacy of FHCs with functionally regulated subsidiaries. The capital adequacy requirements that have been established for banking, securities, and insurance entities by their respective regulators reflect varying definitions of the elements of capital and varying approaches to asset and liability valuations. Yet techniques for assessing capital adequacy must be able to identify situations such as double or multiple leverage or double-gearing. In such cases, the actual capital protection may be overstated.

3900.0.4.2.4 Intra-Group Exposures and Concentrations

Intra-group exposures, including servicing arrangements and risk concentrations, have the potential to threaten the condition of regulated entities. Intra-group exposures may be significant at large, complex FHCs, especially those that operate their businesses on global lines that cut across legal entities within the firm. The Federal Reserve's focus in this area is the potential impact of intra-group exposures and concentrations on insured depository institution subsidiaries of an FHC.

Risk concentrations can take many forms, including exposures to one or more counterparties or related entities, industry sectors, and geographic regions. For risk concentrations, the holding company supervisor is uniquely positioned to understand the combinations of exposures within an organization across all legal entities. This understanding is critical at the group level—risk concentrations that are prudent on a legal-entity basis may aggregate to an unsafe level for the consolidated organization. The Federal Reserve will monitor intra-group exposures and risk concentrations as follows:

1. The appropriate primary bank and thrift regulators will continue to monitor and enforce section 23A and 23B restrictions at the bank or thrift level. The Federal Reserve will focus on assessing whether the FHC monitors and ensures compliance with these statutory requirements. The Federal Reserve plans to begin collecting data from each depository institution subsidiary of BHCs, including FHCs, on their covered transactions with affiliates that are subject to sections 23A and 23B and will share that data with primary bank and thrift regulators.
2. Functional regulators will continue to monitor and enforce any intra-group exposure restrictions that may apply to the regulated entities under their jurisdictions.
3. The Federal Reserve will focus on understanding and monitoring related-party exposures at the group level (including areas such as servicing agreements, derivatives exposures, and payments-system exposures). An important emphasis will be the extent to which risk management in a group's subsidiary depository instutions depends on transactions with affiliates.
4. The Federal Reserve will focus on manage-

ment's effectiveness in monitoring and controlling intra-group exposures and risk concentrations. The Federal Reserve will consider how an organization's risk-management processes measure and manage group-wide risk concentrations.

3900.0.4.2.5 Enforcement Powers

The Federal Reserve is authorized generally to take enforcement action against FHCs and their nonbank subsidiaries. The primary bank and thrift supervisors have the authority to take enforcement action against the banks and thrifts under their respective jurisdictions. Under the GLB Act, the Federal Reserve may take enforcement action against a functionally regulated subsidiary of an FHC, but only when such action is necessary to prevent or redress an unsafe or unsound practice or breach of fiduciary duty that poses a material risk either to (1) the financial safety, soundness, or stability of an affiliated depository institution or (2) the domestic or international payments system. In such circumstances, the Federal Reserve may only take the action if it is not reasonably possible to protect effectively against the material risk through an action directed at or against an affiliated depository institution.

Under any circumstances, the Board may take enforcement action against a functionally regulated subsidiary to enforce compliance with any federal law that the Federal Reserve has specific jurisdiction to enforce against the subsidiary. If the Federal Reserve believes that an enforcement action against a functionally regulated entity is necessary, the Federal Reserve will notify the entity's appropriate functional regulator and, whenever practical, will coordinate such an action with any action taken by the functional regulator. It is expected that the Federal Reserve will not take an enforcement action against a functionally regulated subsidiary (or a person associated with the subsidiary) if the problem involves factors and statutes that are the primary responsibility of the functional regulator.

Under the existing bank holding company framework, the Federal Reserve coordinates enforcement actions with the primary bank and thrift regulators, possibly with some adaptation of the action for the holding company context (such as limitations on parent company debt or dividends). The Federal Reserve will continue to coordinate enforcement actions with these regulators. Similarly, the Federal Reserve will coordinate with functional regulators when formulating and issuing enforcement actions that involve or may have an impact on functionally regulated subsidiaries.

3900.0.4.3 Promotion of Sound Practices and Improved Disclosure

The Federal Reserve can promote sound practices in a number of ways, such as by monitoring trends in risk exposures and risk-management practices across the FHC population through a combination of efforts, including—

1. regular discussions, centered on specific issues and emerging risks, with FHC management;
2. regular meetings with primary bank, thrift, and functional regulators to explore and discuss issues of mutual interest or concern;
3. interagency working groups or specialty teams to gain early insight into risks that cut across the various entities of a conglomerate or groups of conglomerates; and
4. industry conferences on relevant topics of interest.

These initiatives will contribute to the development of sound practices that the Federal Reserve and the primary bank, thrift, and functional regulators can communicate to the senior management and boards of directors of the FHCs, as well as to the senior management of their bank and nonbank subsidiaries.

Improved transparency and public disclosure can meaningfully supplement the efforts of supervisors to monitor the increasingly complex and global activities of diversified banking organizations. Consistent with sound accounting principles, practices, and depository institution safety-and-soundness practices, the Federal Reserve will participate in efforts to enhance disclosures that will illuminate group-wide activities, risk exposures, risk management, controls, and intra-group exposures.

3900.0.4.4 Supervisory Response to Challenges Posed by FHCs

The Federal Reserve's response to the supervisory challenges of FHCs has been in the context of the consolidated supervision of BHCs.[1]

1. The Federal Reserve's framework for supervising large complex banking organizations (LCBOs) is described in SR-99-15. See section 2124.04.

Examples include greater reliance on risk-focused supervision; strengthening relationships with senior management; improving coordination with other federal, state, and international regulatory and supervisory authorities; greater reliance on specialty teams, sound-practices papers, and public disclosures; and simplification of the applications process.

The more diversified FHCs present new supervisory challenges. To address these challenges, the Federal Reserve will continue to strengthen—

1. cooperative arrangements with bank and thrift regulators, the SEC, the CFTC, state insurance and securities regulators, and foreign supervisors;
2. relationships with the FHC management and personnel responsible for significant risk-management functions and, when necessary, the management of the organization's nonbank subsidiaries;
3. information flows that provide supervisors with relevant, up-to-date information without imposing an unwarranted burden on financial organizations;
4. techniques for evaluating capital adequacy for FHCs engaged in an expanded range of nonbank financial activities;
5. public disclosures and market discipline;
6. techniques for assessing the overall risk profile of FHCs and the implications for affiliated depository institutions; and
7. incentives for FHCs to continually review and improve their risk-management processes, internal controls, and audit practices.

The Federal Reserve is committed to working constructively and cooperatively with all regulators involved in overseeing the activities of FHCs and their bank and nonbank subsidiaries.

To become a financial holding company (FHC), a domestic bank holding company (BHC) must file a written declaration with the appropriate Federal Reserve Bank. This declaration should contain the following information:

1. A statement that the BHC elects to be an FHC.
2. The name and head-office address of the company and each depository institution controlled by the company. For purposes of the election process for both domestic BHCs and foreign banks, the term "depository institution" here means any national bank, state-chartered bank, federal branch of a foreign bank, insured branch of a foreign bank, savings association, savings bank, and industrial bank. It also includes any trust company that engages in the business of receiving deposits other than trust funds. (See 12 U.S.C. 1813.) A depository institution does not have to have FDIC insurance.
3. A certification that all depository institutions controlled by the company are well capitalized as of the date the company files its declaration.
4. The capital ratios for all relevant capital measures (as defined in section 38 of the Federal Deposit Insurance Act), as of the close of the previous quarter, for each depository institution controlled by the company on the date the company files its declaration.
5. A certification that all depository institutions controlled by the company are well managed as of the date the company files its declaration. (See SR-00-1.)

A depository institution is well managed if, at the most recent inspection or examination or subsequent review by its appropriate federal banking agency, the institution received (1) at least a satisfactory composite rating and (2) at least a satisfactory rating for management, if such a rating is given. In the case of a depository institution that has not received an inspection or examination rating, a depository institution is well managed if the Board has determined, after a review of the depository institution's managerial and other resources and after consulting with the depository institution's appropriate federal and state banking agency, that the institution is well managed. In addition, a depository institution that results from the merger of two or more depository institutions that are well managed will be considered to be well managed unless the Board determines otherwise after consulting with the appropriate federal banking agency for each depository institution involved in the merger.

A depository institution that results from the merger of a depository institution that is well managed with one or more depository institutions that are not well managed or that have not been examined will be considered to be well managed, if the Board determines that the resulting institution is well managed. The Board makes this determination after a review of the managerial and other resources of the resulting institution and after consulting with the appropriate federal and state banking agencies for the institutions involved in the merger, as applicable.

The Gramm-Leach-Bliley Act (the GLB Act) also requires that all the insured depository institutions controlled by the FHC at the time of the declaration must be rated satisfactory or better under the Community Reinvestment Act (CRA). When determining whether the insured depository institutions controlled by a BHC meet the CRA requirement, the Federal Reserve excludes an institution that was acquired during the 12 months preceding the date the company filed its declaration. To qualify for this exception, (1) the company must have submitted the depository institution's affirmative correction plan to the appropriate federal banking agency, and (2) the agency must have accepted the plan.

A BHC must file its declaration to become an FHC with the appropriate responsible Reserve Bank. A BHC's election to become an FHC is effective on the thirty-first day after the date that a complete declaration was received, unless the Board notifies the company before that time that the election is ineffective. The Board or the appropriate Federal Reserve Bank also may notify a BHC in writing that its election to become an FHC is effective before the thirty-first day after the date that a complete declaration was filed.

When an FHC's declaration becomes effective, it may engage in the expanded financial activities available to such companies. If, however, the Board has timely notified a BHC that its declaration is ineffective, the BHC will not be considered an FHC and may not begin to engage in any expanded activities.

A company that is not a BHC may simultaneously submit an application under section 3(a)(1) of the Bank Holding Company Act (BHC

Act) to become a BHC and to request to become an FHC on consummation of that transaction. The company must (1) state that it seeks to become an FHC on consummation of its section 3 proposal to become a BHC and (2) certify that each depository institution that would be controlled by the company on consummation of the section 3 proposal will be both well capitalized and well managed on the date of consummation. To coordinate action on these two requests, the acceptance of the declaration as complete does not occur until the date the company lawfully consummates its section 3 proposal and becomes a BHC. A simultaneous declaration will not be effective if the Board notifies the company at any time before consummation that (1) any depository institution that would be controlled by the company on consummation will not be well capitalized and well managed or (2) any insured depository institution that would be controlled by the company on consummation has not achieved at least a satisfactory rating at its most recent CRA examination. An insured depository institution that is controlled or would be controlled by a company filing a simultaneous declaration and section 3(a)(1) application to become a BHC may not be excluded for the purposes of evaluating the CRA performance record under this provision or the general FHC certification requirements of section 225.82(d) of Regulation Y.

In most cases, an FHC may, without providing prior notice to or obtaining prior approval from the Board, conduct an activity that is financial in nature or incidental to a financial activity (a financial activity). (See section 225.85(a)(1) of Regulation Y.) An FHC may conduct a financial activity by engaging directly in the activity or by acquiring and retaining the shares of any company that is engaged exclusively in one or more financial activities. An FHC may conduct a financial activity at any location inside or outside of the United States, subject to the laws of the jurisdiction in which the activity is conducted. A company acquired or to be acquired by an FHC also may engage in other activities that are permissible for an FHC, in accordance with any applicable notice, approval, or other requirements.

An FHC may acquire more than 5 percent of the voting shares or control of a company that is not engaged exclusively in activities that are financial in nature, incidental to financial activities, or otherwise permissible for the acquiring FHC. (See section 225.85(a)(3) of Regulation Y.) To do so, the acquisition must meet three requirements:

1. The company to be acquired must be substantially engaged in activities that are financial in nature, incidental to a financial activity, or otherwise permissible for the FHC under section 4(c) of the BHC Act. A company is considered to be substantially engaged in permissible activities if at least 85 percent of the company's consolidated total annual gross revenues is derived from and at least 85 percent of the company's consolidated total assets is attributable to the conduct of activities that are financial in nature, incidental to a financial activity, or otherwise permissible for an FHC under section 4(c) of the BHC Act. An FHC's management should consult with Board staff if they are uncertain whether a proposed acquisition meets this standard.
2. The FHC must comply with the notice requirements of section 225.87 of Regulation Y. The acquired company must conform, terminate, or divest, within two years of the date the FHC acquires shares or control of the company, all activities that are not financial in nature, incidental to a financial activity, or otherwise permissible for the FHC under section 4(c) of the BHC Act. Although an FHC may acquire any percentage of shares or control of a company engaged in limited impermissible activities, the FHC needs only to provide a post-transaction notice if such an acquisition results in control of the company.
3. After being acquired by an FHC, the company engaged in impermissible activities may not engage in or acquire a company engaged in any activity that is not permissible for the FHC.

Section 225.85(c) of Regulation Y identifies two circumstances in which Board approval is still required to engage in financial activities. First, prior approval in accordance with section 4(j) of the BHC Act and section 225.24 of Regulation Y is required to acquire more than 5 percent of the voting shares or control of a savings association or any company that owns, operates, or controls a savings association. Second, the Board may, in the exercise of its supervisory authority, require an FHC to provide it with prior notice or obtain prior Board approval if circumstances warrant. The GLB Act did not change in any way the requirement that a company receive prior Board approval under section 3 of the BHC Act before acquiring shares or control of a bank.

Section 225.87(a) of Regulation Y requires an FHC that commences an activity, or that acquires control or shares of a company engaged in an activity under section 225.86 of Regulation Y, to provide written notice to the appropriate Reserve Bank within 30 calendar days after commencing the activities or consummating the acquisition. The notice must be provided on the FR Y-10 form, obtained from the Board or any Reserve Bank. This requirement also applies to an activity that the FHC may engage in under section 4(c)(8) of the BHC Act that is incorporated under section 4(k) of the act.

There are two circumstances in which notice to the Board is not required to engage in an activity: (1) when an FHC acquires shares of a company without acquiring control of the company, or (2) when an FHC is engaged in securities underwriting, dealing, or market-making activities described in section 4(k)(4)(E), merchant banking investment activities conducted pursuant to section 4(k)(4)(H), or insurance company investment activities conducted pursuant to section 4(k)(4)(I) of the BHC Act, and has provided the System with the appropriate notice regarding the relevant activity. (See section 225.87(b) of Regulation Y.) Under these circumstances, the FHC must provide written notice to the Board within 30 days after acquiring, as part of a merchant banking activity under section 4(k)(4)(H) or an insurance company investment activity under section 4(k)(4)(I) of the BHC Act, more than 5 percent of any company at a cost that exceeds 5 percent of the FHC's tier 1 capital or $200 million, whichever is less.

3901.0.1 SUPERVISORY CONCERNS

In some instances, a U.S. BHC or a foreign bank may meet the statutory requirements to be an FHC, but its capital strength and managerial resources are less than satisfactory on a consolidated basis. In this situation, the Federal Reserve may have supervisory concerns about the consolidated entity although it technically qualifies as an FHC. The Federal Reserve may, in the exercise of its supervisory authority, restrict or limit the conduct of new activities or future acquisitions of an FHC, or take other appropriate action, if it finds that the FHC does not have the financial or managerial resources to conduct the activity or make the acquisition. This supervisory action could be based, for example, on a determination that the company does not have adequate capital or risk-management systems to conduct a specific activity in a safe and sound manner and may involve the issuance of cease-and-desist orders, the execution of written agreements, or other appropriate supervisory action.

3901.0.2 HOLDING COMPANY FAILS TO CONTINUE MEETING FHC CAPITAL AND MANAGEMENT REQUIREMENTS

If a domestic bank holding company has made an effective election to be an FHC, and the Board finds that any depository institution subsidiary owned or controlled by the company ceases to be well capitalized or well managed, the company must execute an agreement acceptable to the Federal Reserve Board to comply with all applicable capital and management requirements. This agreement should be executed within 45 days after the Board notifies the company that it is not in compliance with the applicable requirements for an FHC. (See section 225.83 of Regulation Y.)

At the request of the bank holding company, the Federal Reserve Board may extend the 45-day period. The request should state why an extension is necessary. The agreement must explain the specific actions that the bank holding company will take to correct all areas of noncompliance, provide a schedule for all such actions, and provide any other information the Board may require, and be acceptable to the Board.

During the period of noncompliance, the Federal Reserve Board may impose limitations or conditions on the activities of the company. In addition, the company must obtain the Board's approval before conducting any of the activities that are newly authorized for FHCs by the GLB Act. Section 225.83 of Regulation Y also sets forth the consequences of failing to correct the noncompliance within a period of 180 days. Such consequences may include divestiture of ownership or control of any depository institution the company owns or controls, or the cessation of the expanded activities permitted for FHCs.

3901.0.3 DEPOSITORY INSTITUTION SUBSIDIARY FAILS TO MAINTAIN A SATISFACTORY OR BETTER CRA RATING

The Federal Reserve Board prohibits an FHC from engaging in any additional activity[1] or acquiring control of a company engaged in any activity under section 4(k) and 4(n) of the BHC Act if any insured depository institution controlled by the FHC fails to maintain a satisfactory or better CRA rating.

1. With respect to engaging in any additional activities, see section 225.84 of Regulation Y for the exceptions.

3901.0.4 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

Subject	*Laws*[1]	*Regulations*[2]	*Interpretations*[3]	*Orders*

3903.0.1 FINANCIAL HOLDING COMPANY QUALIFICATION REQUIREMENTS FOR FOREIGN BANKS

A foreign bank that owns or controls a U.S. bank (and any company that controls the foreign bank) must comply with the same requirements as a domestic bank holding company (BHC) that elects to be treated as a financial holding company (FHC). Either entity is thus able to engage in authorized financial activities under the Gramm-Leach-Bliley Act (GLB Act). If a foreign bank does not own a subsidiary bank in the United States, but instead operates through a branch, agency, or commercial lending company located in the United States, the foreign bank (and any company that controls the foreign bank) is subject to the Bank Holding Company Act (BHC Act) as if the foreign bank or company were a BHC. Such foreign banks may, like U.S. BHCs, also elect to be treated as FHCs. Foreign banks electing to be treated as FHCs must meet ‘‘well-capitalized’’ and ‘‘well-managed’’ standards comparable to those that are applicable to U.S. depository institutions. Futher, any U.S. branches of the foreign bank that are FDIC-insured must be rated satisfactory or better under the Community Reinvestment Act (CRA).[1] (See section 225.90 of Regulation Y.)

To be treated as an FHC, a foreign bank (or a company that owns or controls a foreign bank) that operates in the United States only through U.S. branches, agencies, or commercial lending subsidiaries must file a written declaration with the appropriate Reserve Bank. This declaration must contain items 1 through 6 below. Foreign banks or companies that operate in the United States through U.S. branches, agencies, or commercial lending companies and through a U.S. subsidiary bank are not required to provide item 1, but they must provide the items domestic BHCs are to provide.

1. a statement that the foreign bank or company elects to be treated as an FHC
2. the risk-based capital ratios and the amounts of tier 1 capital and total assets of the foreign bank as of the close of the most recent quarter, and as of the close of the most recent audited reporting period
3. a certification that the foreign bank meets the standards to be well capitalized that are set out in section 225.90(b)(1)(i) and (ii) or section 225.90(b)(2) of Regulation Y, as of the date the foreign bank or company files its election
4. a certification that the foreign bank is well managed, as defined in section 225.90(c)(1) of Regulation Y, as of the date the foreign bank or company files its election
5. a certification that all U.S. depository institutions controlled by the foreign bank or company (including thrifts and nonbank trust companies) are well capitalized and well managed as of the date the foreign bank or company files its election
6. the capital ratios and all relevant capital measures (as defined in section 38 of the Federal Deposit Insurance Act) for all U.S. depository institution subsidiaries of the foreign bank or company as of the end of the previous quarter

The well-capitalized and well-managed tests in items 2, 3, and 4 above apply to each foreign bank that has U.S. operations in the form of a branch, agency, or commercial lending company subsidiary that is part of a foreign banking organization seeking certification as an FHC.

For those foreign banks whose home-country supervisors have adopted risk-based capital standards consistent with the Basel Accord, their tier 1 and total risk-based capital ratios, as calculated under the home-country standard, must be at least 6 percent and 10 percent, respectively. The Board will determine the comparability of the foreign bank's capital under the listed comparability factors in section 225.92(e) of Regulation Y. Among these factors are the composition of the foreign bank's capital, accounting standards, long-term debt ratings, the ratio of tier 1 capital to total assets, reliance on government support to meet capital requirements, the foreign bank's anti–money laundering procedures, whether the foreign bank is subject to comprehensive consolidated supervision, and other factors that may affect the analysis of capital and management.[2] For those foreign banks whose

1. Under the GLB Act, the capital and management standards the Board must apply to foreign banking organizations that elect to become FHCs should be comparable to the standards applied to domestic institutions, giving due regard to the principle of national treatment and equality of competitive opportunity.

2. The Board may consider whether the overall level of the foreign bank's capital and other factors indicate that addi-

home-country supervisors have not adopted the Basel Accord and for any other foreign banking organizations that otherwise do not meet the capital standards noted above, the foreign bank may be considered well capitalized by obtaining from the Board a prior determination that its capital is otherwise comparable to the capital that would be required of a U.S. banking organization to become an FHC. The pre-clearance process provided by section 225.91(c) of Regulation Y can be used to obtain this determination.

A foreign bank will be considered well managed if—

1. the branches, agencies, and commercial lending subsidiaries of the foreign bank have received at least a satisfactory composite rating at their most recent examination;[3]
2. the home-country supervisor of the foreign bank consents to the foreign bank expanding its activities in the United States to include FHC activities;[4] and
3. the Board determines that the management of the foreign bank meets standards comparable to those required of a U.S. bank owned by an FHC.

The Board believes that, as a general rule, the top tier foreign bank in a foreign banking group that requests an FHC determination should be subject to comprehensive consolidated supervision by the home-country supervisor.

As a general matter, a foreign bank will *not* be determined to be well capitalized and well managed when it is not subject to comprehensive consolidated supervision. When a foreign bank has not been determined by the Board to be subject to comprehensive consolidated supervision, and the Board has not deemed any other bank from the country where the foreign bank is chartered to be subject to comprehensive consolidated supervision, the foreign bank must use the pre-clearance process provided by section 225.91(c) of Regulation Y—even if it otherwise meets the objective screening criteria. The Board may review a foreign bank's home-country supervision through the pre-clearance process and make a comprehensive consolidated supervision determination in that context. The Board will try to make a determination on pre-clearance requests within 30 days of receipt.[5]

There may be limited situations when an exceptionally strong bank from a country that has not yet fully implemented comprehensive consolidated supervision should be considered for FHC status. Such a foreign bank can qualify for FHC status if (1) the home-country supervisor has made significant progress in adopting and implementing arrangements for the consolidated supervision of its banks, and (2) the foreign bank demonstrates significant financial strength, such as through high levels of capital or exceptional asset quality. The Board anticipates, however, that a foreign bank that is not subject to comprehensive consolidated supervision will be granted FHC status only in rare instances.

As in the case of domestic BHCs, each U.S. depository institution subsidiary of a foreign bank is required to meet all the well-capitalized and well-managed standards in order for the foreign bank or company to obtain FHC status in the same manner as required for U.S. BHCs. In addition, all the U.S. insured depository institutions controlled by the foreign bank or company must be rated satisfactory or better under the CRA. If the foreign bank operates a U.S. branch that is FDIC-insured, the branch must be rated satisfactory or better under the CRA.

tional analysis should be undertaken to assess comparability. The Board will not impose a specific standard for the foreign bank's ratio of tier 1 capital to total assets (the leverage ratio), but a foreign bank's leverage ratio may be among the factors taken into account in the comparability review.

3. The Federal Reserve's foreign bank examination process includes the assignment of a combined assessment (the combined ROCA rating) of a foreign banking organization's (FBO's) U.S. branch, agency, and commercial lending operations through the regular examination cycle. (See SR-00-14.) The combined ROCA rating will be factored into the FBO's overall combined U.S. operations rating, which will continue to be a single composite rating that reflects the U.S. supervisors' collective assessment of all operations (that is, banking and nonbanking) of the FBO in the United States. If a foreign bank wishes to obtain FHC status, but does not have the assignment of a combined U.S. banking assessment as part of the regular examination cycle, the foreign bank can contact its responsible Federal Reserve Bank or engage in the pre-clearance process. If a foreign banking group contains more than one foreign bank with U.S. banking offices, each such foreign bank in the group must have a satisfactory composite U.S. banking assessment in order for the foreign banking group or any of its subsidiaries to obtain FHC status.

4. The home-country supervisor should consider the FBO's consolidated capital and management before providing its consent to the expansion. If the home country has no formal consent process, the Board will consult with the supervisor to assure itself that the supervisor considers the capital and management of the bank to satisfy its home-country standards and that the supervisor has no objections to the expansion.

5. If the Board makes an affirmative comprehensive consolidated supervision determination through the FHC pre-clearance process, the determination will be relied on for the foreign bank to establish additional branches and agencies under the Foreign Bank Supervision Enhancement Act.

An election by a foreign bank or company to be treated as an FHC will become effective on the thirty-first day after the date that an election was received by the appropriate Reserve Bank, unless the Board notifies the foreign bank or company before that time that the election is ineffective or unless the period for the Board's determination is extended with the consent of the foreign bank or company making the election. The date the Federal Reserve Bank receives the declaration should be considered the first day of the 30-day review period. The Board or the Reserve Bank also may notify a foreign bank or company in writing that its election to become an FHC is effective before the thirty-first day after the election was filed. A foreign bank or company should file the declaration (or pre-clearance request) with the responsible Reserve Bank.

If the election is determined to be effective, the foreign bank or company may engage in the financial activities available to FHCs. The GLB Act requires that an FHC that engages in an activity, or that acquires control or shares of a company engaged in an activity, under section 4(k) of the BHC Act provide written notice to the appropriate Reserve Bank within 30 calendar days after commencing the activities or acquisition. The notice should describe the activity commenced or identify the name of the company acquired and describe its activities.

3903.0.2 FOREIGN BANK FAILS TO CONTINUE MEETING FHC CAPITAL AND MANAGEMENT REQUIREMENTS

If a foreign bank or company has made an effective election, and the Board finds that the foreign bank; any foreign bank that is controlled by the foreign bank and maintains a U.S. branch, agency, or commercial lending company; or any U.S. depository institution owned or controlled by the foreign bank or company ceases to be well capitalized or well managed, the foreign bank or company must execute an agreement acceptable to the Federal Reserve Board to comply with all applicable capital and management requirements. This agreement should be executed within 45 days after the Board notifies the foreign bank or company that it is not in compliance with the applicable requirements for an FHC. (See section 225.93 of Regulation Y.) At the request of the foreign bank or company, the Board may extend the 45-day period. (The request should state why an extension is necessary.) The agreement must explain the specific actions that the foreign bank or company will take to correct all areas of noncompliance, provide a schedule for all such actions, provide any other information the Board may require, and be acceptable to the Board. During the period of noncompliance, the Board also may impose limitations or conditions on the U.S. activities of the foreign bank or company. Section 225.93 of Regulation Y also sets forth the consequences of failing to correct the noncompliance within a period of 180 days. Such consequences may include termination of the foreign bank's U.S. branches and agencies and divestiture of its commercial lending company subsidiaries, or cessation of the expanded activities permitted for FHCs. The foreign bank may also choose to cease engaging in activities not permitted for a foreign bank under sections 2(h) and 4(c) of the BHC Act.

3903.0.3 INSURED BRANCH FAILS TO MAINTAIN A SATISFACTORY OR BETTER CRA RATING

When an insured branch of a foreign bank, or an insured depository institution controlled by a foreign bank, fails to maintain a satisfactory or better CRA rating, section 225.94 of Regulation Y applies the provisions of section 225.84 to the foreign bank and to any company that owns or controls the foreign bank. For these purposes, the insured branch is treated as an "insured depository institution." An FHC is thus prohibited by the Board from engaging in any additional activity or acquiring control of a company engaged in activities under section 4(k) or 4(n) of the BHC Act.(See section 225.84 of Regulation Y.)

1. 12 U.S.C., unless specifically stated otherwise.
2. 12 C.F.R., unless specifically stated otherwise.
3. *Federal Reserve Regulatory Service* reference.

The Gramm-Leach-Bliley Act (GLB Act) amended the Bank Holding Company Act (BHC Act) to allow a BHC or foreign bank that qualifies as a financial holding company (FHC) to engage in a broad range of activities that the GLB Act defines as ‘‘financial in nature.’’ Section 4(k)(4)(A)–(E) of the BHC Act defines the following activities as financial in nature:

1. lending, exchanging, transferring, investing for others, or safeguarding money or securities
2. insuring, guaranteeing, or indemnifying against loss, harm, damage, illness, disability, or death, or providing and issuing annuities, and acting as principal, agent, or broker for purposes of the foregoing, in any state
3. providing financial, investment, or economic advisory services, including advising an investment company (as defined in section 3 of the Investment Company Act of 1940)
4. issuing or selling instruments representing interests in pools of assets permissible for a bank to hold directly
5. underwriting, dealing in, or making a market in securities

These activities include activities that the Board had previously determined to be impermissible for BHCs, such as acting as principal, agent, or broker for purposes of insuring, guaranteeing, or indemnifying against loss, harm, damage, illness, disability, or death, and issuing annuity products. Permissible insurance activities as principal include reinsuring insurance products.

An FHC acting under section 4(k)(4)(B) of the BHC Act may conduct insurance activities without regard to the restrictions on the insurance activities imposed on BHCs under section 4(c)(8).

Providing claims administration and risk-management services. Legal counsel representing an FHC sought an opinion as to whether an insurance agency owned by an FHC may engage in certain insurance claims activities, as described below, under section 4(k)(4)(B) of the BHC Act. In particular, it was asked whether such an insurance agency may engage in the following claims administration activities in connection with its insurance sales activities: (1) collecting insurance premiums, (2) holding insurance premiums in trust, (3) establishing an insurance-claims-paying account, (4) adjusting insurance claims (which would include obtaining facts about claims, investigating the veracity of claims, and estimating losses relating to claims), (5) negotiating with insureds and their representatives concerning insurance claims, and (6) paying and settling insurance claims. A representation was made that insurance agents typically perform these claims administration services for an insurance underwriter in connection with insurance policies sold by the agents on behalf of an insurance underwriter.

With respect to the insurance risk-management activities provided in connection with insurance sales activities, a legal opinion was requested as to whether an insurance agency or broker owned by an FHC could engage in the following activities: (1) assessing the risks of a client seeking insurance and identifying the client’s exposures to loss; (2) designing programs, policies, and systems (such as workplace safety programs) to reduce the client’s risks; (3) advising clients about risk-management alternatives to insurance (such as self-insurance, securitization, or derivatives); and (4) negotiating insurance coverages, deductibles, and premiums for an insurance client. It was represented that insurance agents and brokers provide these risk-management services to their customers in connection with the sale of insurance products, including, in particular, commercial property and casualty insurance, and other insurance activities. It also was understood that the proposed risk-management services would (1) be related to managing insurable risks, (2) be advisory in nature, and (3) not allow the risk manager to control or perform operations of its clients.

Board staff noted that most states require a person performing one or more of the insurance claims administration services listed above to be licensed by, or registered with, the appropriate insurance authority of the state either as an insurance company, an insurance agent, or a third-party administrator (TPA).[1] The legislative history of the GLB Act also suggests that Con-

1. For example, the Model Third Party Administrator Statute adopted by the National Association of Insurance Commissioners (NAIC) requires a person who collects premiums or adjusts or settles claims for an insurer in connection with the sale of life or health insurance policies or annuities to register with the relevant state insurance authority as a TPA if the person is not already registered with the state as an insurance company, agent, or broker. See the NAIC Model Third Party Administrator Statute, sections 1.A and 11 (1996).

The NAIC’s Model Managing General Agents Act also requires a person to register with the relevant state insurance authority if the person adjusts or pays claims for an insurer and engages in certain other activities on behalf of an insurer.

gress believed that insurance-related claims administration services are a necessary part of the insurance sales and underwriting activities authorized by section 4(k)(4)(B).[2]

State insurance laws generally do not require companies that provide insurance risk-management services to obtain a special insurance license. States generally do require a license of any person that negotiates insurance coverages, deductibles, and premiums for another.[3]

In a legal opinion dated July 10, 2002, Board staff opined that the specific insurance claims administration services listed above are encompassed within the insurance activities authorized by section 4(k)(4)(B) of the BHC Act, and that the services may be conducted by an FHC when they are provided by an insurance agent or broker in connection with its other insurance sales activities. In addition, Board staff believes that the specific insurance risk-management services listed above are encompassed within section 4(k)(4)(B) insurance activities, and the services may be conducted by an FHC if they (1) are provided by an insurance agent or broker in connection with its other insurance sales activities, (2) involve managing insurable risks, (3) are advisory in nature, and (4) do not allow the FHC to control, or perform operations of, the person to which the services are provided.[4]

Acting as a third-party administrator. Other legal counsel representing a BHC that had elected to become an FHC requested an opinion on whether acting as a TPA on behalf of an insurance company is an activity that is permissible for an FHC under the BHC Act. The BHC proposed to invest in a company that acts as a TPA for licensed insurance companies that underwrite and sell credit life insurance. A TPA provides one or more insurance companies with administrative and related services that support and assist the sale of insurance products by the insurance company. A TPA may provide some or all of the following services to an insurance company: (1) assisting the insurance company in designing its insurance programs (which would include policy and certificate development and issuance); (2) determining whether a prospective insured meets the insurance company's established underwriting guidelines; (3) collecting and processing insurance premiums; (4) processing, adjudicating, and paying claims on behalf of the insurance company; (5) investing excess cash and maintaining bank accounts for the insurance company; (6) establishing risk reserves for the insurance company; (7) advising on, and arranging for, reinsurance or stop-loss insurance for the insurance company; (8) preparing and filing tax returns and regulatory reports for the insurance company and providing other related services designed to ensure that the insurance company remains properly licensed and in compliance with applicable governmental regulations; (9) providing accounting and recordkeeping services to the insurance company in connection with its insurance activities; and (10) providing insurance-product sales training to employees of the insurance company. It was represented that the BHC may engage in some, but not all, of the activities in its capacity as a TPA.

The Board's staff noted that the activities listed above are directly related to the provision and sale of insurance by a third-party insurance company and constitute an integral part of the regulated insurance activities of the third-party insurance company. Most states consequently require a person performing one or more of these services for an insurance company to be licensed by, or registered with, the appropriate insurance authority of the state either as an insurance company or agent or as a TPA. In addition to the previously stated requirements, the Model Third Party Administrator Statute (Model TPA Statute) requires a person to register as a TPA if the person accepts insurance contracts for an insurer that meet the insurer's underwriting guidelines, assists an insurer in the overall planning and coordination of its insurance program, or collects premiums or adjusts claims for an insurer.[5]

See NAIC Model Managing General Agents Act, sections 2.C and 3 (1993).

2. See H.R. Rep. No. 106-74, part I, p. 122 (1999) ("Activities such as administering, marketing, advising or assisting with . . . claim administration or similar programs shall be deemed to be incidental to insurance activities as described in [section 4(k)(4)(B)].").

3. See NAIC Producer Licensing Model Act, sections 2. K and 3 (2000).

4. A BHC or an FHC may provide advice to customers concerning financial matters, including insurance, self-insurance, securitizations, and derivatives, under 12 C.F.R 225.28(b)(6) and may provide management consulting advice to customers regarding nonfinancial equity matters, such as workplace safety, subject to Regulation Y's limits and restrictions. See 12 C.F.R. 225.28(b)(9) (management consulting activities permissible for all bank holding companies) and 225.86(b)(1) (management consulting activities permissible for all FHCs).

5. See the NAIC Model TPA Statute, sections 1.A and 11 (1996). A person generally does not have to register as a TPA if the person is currently registered with the state as an insurer or as an insurance agent or broker. See Model TPA Statute, section 1.A.(3) and (4).

Similarly, the NAIC's Model Managing General Agents

In a legal opinion dated July 10, 2002, the Board staff opined that the above-listed services are encompassed within the insurance activities authorized by section 4(k)(4)(B) of the BHC Act when provided to, or on behalf of, an insurance company in connection with the sale or underwriting of insurance. Staff concluded that an FHC could, under section 4(k)(4)(B) of the BHC Act, provide these services to a third-party insurance company.

Section 4(k)(4)(F) of the BHC Act also defines as financial in nature any activity that the Board determined to be closely related to banking under section 4(c)(8) of the BHC Act by a regulation or order that was in effect on November 12, 1999. Section 225.86(a)(1) of Regulation Y cross-references the long-standing ''laundry list'' of nonbanking activities (at section 225.28(b)) permissible by regulation for BHCs. Section 225.86(a)(2) lists nonbanking activities approved for BHCs by Board order as of November 12, 1999.[6] All activities an FHC may engage in pursuant to section 225.86(a) must be conducted subject to the terms and conditions in Regulation Y and the Board orders authorizing those activities.

Section 4(k)(4)(G) of the BHC Act also defines ''financial in nature'' as any activity (1) in which a BHC may engage outside the United States, and (2) that the Board has determined, by regulation or interpretations issued under section (4)(c)(13) of the BHC Act that were in effect on November 11, 1999, to be usual in conducting banking or other financial services abroad.[7] Section 225.86(b) lists three activities that the Board has found to be usual in connection with the transaction of banking or other financial operations abroad. These activities are—

1. providing management consulting services, including services to any person with respect to nonfinancial matters, so long as the services are advisory and do not allow the FHC to control the person to whom the services are provided (these services go beyond the management consulting services that are allowed under section 225.28(b)(9) of Regulation Y and are incorporated by reference at section 225.86(a)(1));
2. operating a travel agency in connection with financial services offered by the FHC or others; and
3. organizing, sponsoring, and managing a mutual fund, so long as the fund does not exercise managerial control over the companies in which it invests and the FHC reduces its ownership, if any, of the fund to less than 25 percent of the equity of the fund within one year (or such longer time as the Board permits) after sponsoring the fund.

The activities that a BHC is authorized to engage in outside the United States under sections 211.8 and 211.10 of Regulation K have been either (1) authorized for FHCs in a broader form by the GLB Act (for example, underwriting, distributing, and dealing in securities and underwriting various types of insurance) or (2) authorized in the same or a broader form in Regulation Y (for example, data processing activities; real and personal property leasing; and acting as agent, broker, or adviser in leasing property).[8] The remaining activities authorized by section 4(k)(4) of the BHC Act are those activities that are defined to be ''financial in nature'' under section 4(k)(4)(H) and (I). These are merchant banking activities conducted under section 4(k)(4)(H) through a securities affiliate or an affiliate thereof, or through an affiliate of an insurance company (as defined in section 4(k)(4)(I)(ii)) when the affiliate is registered under the Investment Advisers Act of 1940 and provides investment advice to an insurance company or is an affiliate of such a registered company. Under section 4(k)(4)(I), these merchant banking activities may be conducted by an insurance company. These activities must be conducted in accordance with the restrictions and limitations under subpart J of Regulation Y, sections 225.170 through 225.177.

Section 4(k)(1)(A) of the BHC Act also allows FHCs to engage in activities that the Board, in coordination with the Secretary of the Treasury, determines to be financial in nature or incidental to such financial activity. Section 225.86(d) of

Act requires a person to register with the relevant state insurance authority, if the person manages all or part of the business of an insurer or, subject to certain conditions, accepts or rejects policies for the insurer and either adjusts or pays claims for the insurer or negotiates reinsurance for the insurer. See the NAIC Model Managing General Agents Act, sections 2.C and 3 (1993).

6. Section 20 company activities are not included in this list. Section 4(k)(4)(E) of the BHC Act authorizes FHCs to engage in securities underwriting, dealing, and market-making activities in a broader form than was previously authorized by Board order.

7. See sections 211.8 and 211.10 of Regulation K (12 C.F.R. 211.8 and 211.10).

8. The Board also has approved, under section 4(c)(13) of the BHC Act, activities in individual orders. Section 4(k)(4)(G) of the BHC Act does not authorize an FHC to engage in activities that the Board has authorized a BHC to provide in individual orders.

Regulation Y lists only one activity, acting as a finder, that has been authorized under this provision. (See section 3910.0 in this manual.) Section 4(k)(1)(B) of the BHC Act allows FHCs to seek Board approval to engage in any activity that the Board determines to be complementary to a financial activity and not to pose a substantial risk to the safety and soundness of depository institutions or the financial system generally.

Other permissible activities under section 4(k)(4)(E) of the BHC Act are underwriting and dealing in or making a market in securities without any limitation on revenues that can be derived from bank-ineligible securities. These activities must be conducted in accordance with applicable restrictions and limitations found in the BHC Act and any regulations or supervisory guidance adopted by the Board. The Board adopted an interim rule pertaining to these activities, effective March 11, 2000.[9] It imposed two restrictions on FHCs engaged in securities underwriting, dealing, or market-making activities. All intraday extensions of credit by a bank, thrift, or U.S. branch or agency of a foreign bank to an affiliated company engaged in these activities under section 4(k)(4)(E) must be on market terms consistent with section 23B of the Federal Reserve Act (FRA). In addition, a foreign bank that is an FHC must ensure that its U.S. branch or agency making a loan to or purchasing securities from such an affiliated company complies with sections 23A and 23B of the FRA as if the branch or agency were a member bank.

Section 4(k)(5) of the BHC Act requires the Board and the secretary of the Treasury to define three categories of activities as financial in nature, as well as the extent to which these activities are financial in nature or incidental to a financial activity. These three categories encompass a wide range of activities:

1. lending, exchanging, transferring, investing for others, or safeguarding financial assets other than money or securities
2. providing any device or other instrumentality for transferring money or other financial assets
3. arranging, effecting, or facilitating financial transactions for the account of third parties

The above categories include activities in which FHCs and national banks and their financial subsidiaries are already permitted to engage. For example, the categories include safe deposit services, electronic funds transfer activities, credit and stored-value card activities, and securities brokerage, as well as finder activities. The categories are intended to allow FHCs and financial subsidiaries to engage in activities that were not otherwise permitted for these companies. The procedure below allows an FHC or financial subsidiary to obtain a determination from the Board and the secretary of the Treasury that an activity is financial in nature or incidental to a financial activity pursuant to section 4(k)(5).

An FHC's request for the Board to determine whether an activity falls within one of the three categories listed above must be in writing. The request must—

1. identify and define the activity for which the determination is sought, specifically describing what the activity would be and how the activity would be conducted, and
2. provide information that supports the requested determination, including information on how the proposed activity falls into one of the three categories, as well as any other information the Board requires concerning the proposed activity.

9. This interim rule added paragraph (g) to section 225.4 of Regulation Y, which imposed the two restrictions.

In making its determination, the Board will take into account the same factors that it must consider when determining whether an activity is financial in nature or incidental to a financial activity. These factors include, among other things, changes in the marketplaces in which FHCs and banks compete, changes in technology for delivering financial services, and whether the activity is necessary or appropriate to allow FHCs and their affiliates, or banks and their subsidiaries, to compete effectively with any company seeking to provide financial services in the United States.

If an activity is listed in more than one provision of section 4 of the BHC Act, the FHC may choose to conduct the activity under any applicable provision. The FHC is subject only to the procedures and limitations that the chosen source of authority imposes on the activity.

3905.0.1 ACTIVITIES THAT ARE PERMISSIBLE FOR FHCs UNDER SECTION 225.86(a) OF REGULATION Y

Activities That Are Financial in Nature or That Are Incidental to a Financial Activity	*Manual Section 3600.*
1. Nonbanking activities listed in section 225.28(b) of Regulation Y that have been determined to be so closely related to banking as to be a proper incident thereto (see section 3000.0.2).	
2. Any nonbanking activity that the Board has determined by order (those in effect on November 12, 1999) to be so closely related to banking as to be a proper incident thereto. The activities are—	
a. providing administrative and other services to mutual funds;	27
b. owning shares of a securities exchange;	6
c. acting as a certification authority for digital signatures, and authenticating the identity of persons conducting financial and nonfinancial transactions (includes transactions abroad);	7
d. providing employment histories to third parties for use in making credit decisions and to depository institutions and their affiliates for use in the ordinary course of business;	29
e. check-cashing and wire-transmission services;[1]	
f. in connection with offering banking services, providing notary public services, selling postage stamps and postage-paid envelopes, providing vehicle-registration services, and selling public-transportation tickets and tokens; and	25
g. real estate title abstracting.	30

1. See 1990 FRB 860 and 1995 FRB 1130.

An FHC or other interested party may request that the Board, in consultation with the Secretary of the Treasury, determine that an additional activity is financial in nature or incidental to a financial activity. The written request should (1) identify and define the activity, specifically describing what the activity would involve and how the activity would be conducted; (2) explain in detail why the activity should be considered financial in nature or incidental to a financial activity; and (3) provide information supporting the request and any other information the Board requests concerning the proposed activity. (See section 225.88(b) of Regulation Y.)

An FHC may request an advisory opinion from the Board on whether a proposed specific activity falls within the scope of an activity already determined to be a financial activity and listed in section 225.86 of Regulation Y. The request must be in writing and provide (1) a detailed description of the activity, product, or service about which the company proposes to engage in or provide; (2) an explanation supporting an interpretation on the scope of the permissible financial activity; and (3) any other information the Board requests. (See section 225.88(e) of Regulation Y.)

An FHC may request approval to engage in an activity that is complementary to a financial activity. The written request must (1) identify the proposed complementary activity, specifically describing what the activity would involve and how it would be conducted; (2) identify the financial activity for which the proposed activity would be complementary and provide information to support a finding that the proposed activity should be considered complementary to the identified financial activity; (3) describe the scope and relative size of the proposed activity, as a percentage of projected FHC revenues and on the basis of assets associated with conducting the activity; (4) discuss the risks that conducting the proposed activity pose to the subsidiary depository institutions of the FHC and the financial system in general; (5) describe the potential adverse effects of conducting the activity and explain the proposed measures the FHC would take to address these potential effects; and (6) provide any other information the Board requests. (See section 225.89(a) of Regulation Y.)

3905.0.2 SECURITIES UNDERWRITING, DEALING, AND MARKET-MAKING ACTIVITIES

The GLB Act also authorizes securities underwriting, dealing, and market making without regard to whether such securities may be sold by a bank. This activity includes underwriting or distributing shares of open-end investment companies commonly referred to as mutual funds.

Securities underwriting activities conducted under section 4(k)(4)(E) of the BHC Act may be conducted without regard to the 25 percent revenue limitation that is applicable to section 20 nonbank subsidiaries of BHCs engaged in securities underwriting and dealing, as authorized by Board order under section 4(c)(8). In addition, dealing may be done without regard to the 5 percent limitation on ownership of voting securities.

The operating standards applicable to section 20 companies do not apply to FHCs that engage in securities underwriting, dealing, and market making under section 4(k)(4)(E) of the BHC Act, with two exceptions. First, intraday extensions of credit to a securities firm from an affiliated bank or thrift or U.S. branch or agency of a foreign bank must be on market terms consistent with section 23B of the FRA. Second, foreign banks that are FHCs or that are treated as FHCs are required to comply with the restrictions of sections 23A and 23B of the FRA with respect to lending and securities-purchase transactions between the U.S. branch or agency of a foreign bank and a U.S. securities affiliate. The operating standards and revenue limit continue to apply to BHCs that are not FHCs and to FHCs that continue to conduct securities activities pursuant to section 4(c)(8) of the BHC Act.

3905.0.3 LAWS, REGULATIONS, INTERPRETATIONS, AND ORDERS

3907.0.1 MERCHANT BANKING INVESTMENT AUTHORITY

The Gramm-Leach-Bliley Act (GLB Act) and the Board's Regulation Y permit financial holding companies (FHCs) (but not bank holding companies (BHCs) generally) to make investments as part of a bona fide securities underwriting or merchant or investment banking activity.[1] These investments may be made in any type of ownership interest in any type of nonfinancial entity (portfolio company), and they may include any amount up to all of the ownership interests in the company. The investments that may be made are substantially broader in scope than the investment activities that are otherwise permissible for BHCs.

The authority section 4(k)(4)(H) of the Bank Holding Company Act (BHC Act) grants to FHCs to make merchant banking investments (MBIs) is an alternative to any other authority that the FHC may have to make investments in nonfinancial companies under other provisions of the BHC Act, except as specifically noted in the rule. For example, the rule's provisions do not apply to investments acquired as part of securities underwriting, dealing, or market-making activities conducted under section 4(k)(4)(E) of the BHC Act; investments made by insurance underwriting subsidiaries of an FHC in accordance with section 4(k)(4)(I) of the BHC Act; investments made under section 4(c)(6) or (7) of the BHC Act; or investments made overseas under the Board's Regulation K (12 C.F.R. 211).[2] As described below, the BHC Act allows an FHC to make MBIs if it controls a securities affiliate or controls both an insurance underwriter and a registered investment adviser. The GLB Act does contain certain limitations on MBIs made by FHCs, and it provides a framework for MBIs that is designed to help maintain the separation between banking and commerce to ensure the safety and soundness of depository institutions. All MBIs made by an FHC under section 4(k)(4)(H) must comply with the Board's rule.

3907.0.2 PERMITTED INVESTMENTS

Under section 4(k)(4)(H) of the BHC Act and the Board's rule, an FHC may acquire or control *any* amount of shares, assets, or a full range of ownership interests in a company or other entity that is engaged in an activity that is *not* financial in nature, incidental to a financial activity, or otherwise permissible for the FHC under section 4 of the BHC Act. The interests an FHC may acquire include securities, warrants, partnership interests, trust certificates, other instruments representing an ownership interest in a company, and instruments convertible into a security or other ownership interest whether the interest is voting or nonvoting. An FHC can acquire *any amount* of ownership interests in the company or other entity, whether or not that amount results in control for purposes of the BHC Act. An FHC must file a notice with the Board under section 4(k)(6) of the BHC Act and section 225.87 of Regulation Y (12 C.F.R. 225.87) within 30 days after commencing MBI activities or acquiring any company that makes MBIs.[3]

An FHC also can acquire and control "assets" other than debt or equity securities or other ownership interests of a company. For example, assets acquired as an MBI may include real estate or the assets of a division of an operating company. To be permissible, the assets must be acquired through or promptly transferred to a portfolio company that has and maintains a separate corporate existence, management, and operations to the extent required by the rule. (See section 225.170(e)(3) of Regulation Y.)

3907.0.2.1 Securities Affiliate

A BHC may make MBIs only if it becomes an FHC.[4] The FHC must either (1) control or be a "securities affiliate" or (2) control both an insurance underwriter affiliate and an invest-

1. Unless stated otherwise in this section, the "merchant banking statutory provisions" refer to section 4(k)(4)(H) of the Bank Holding Company Act, and references to the "rule" or "regulatory provisions" pertain to Regulation Y and are found in sections 225.170 through 225.177.

2. Although the rule does not apply to investments held under section 4(c)(6) or (7) of the BHC Act or the Board's Regulation K, those authorities are only available if the FHC's aggregate investment in the relevant company under a combination of authorities, including any investment made under the merchant banking authority, is within the applicable investment limitations and restrictions set forth in section 4(c)(6) or (7) or Regulation K.

3. See section 4(k)(6)(A) of the BHC Act (12 U.S.C. 1843(k)(6)(A)) and section 225.87(a) of Regulation Y (12 C.F.R. 225.87(a)).

4. The Board's Regulation Y sets forth the procedures and qualification criteria applicable to BHCs that seek to elect to become an FHC. See section 225.81 et seq. of Regulation Y (12 C.F.R. 225.81 et seq.).

ment adviser affiliate registered under the Investment Advisers Act of 1940 that provides investment advice to an insurance company. The GLB Act and the rule, however, do *not* require that the FHC make its MBIs *through* such a securities, insurance underwriting, or investment adviser affiliate. Instead, an FHC may make MBIs directly or through any affiliate other than a depository institution or a subsidiary of a depository institution.

The rule defines a ''securities affiliate'' to include any broker or dealer registered with the Securities and Exchange Commission (SEC) under the Securities Exchange Act of 1934 (Exchange Act). The definition also includes an SEC-registered municipal securities dealer, including a separately identifiable division or department of a bank that is registered as a municipal securities dealer under the Exchange Act. An FHC may make MBIs if the holding company is itself a registered securities broker or dealer.

3907.0.2.2 Investments in Companies Engaged in Nonfinancial Activities

An FHC is authorized under section 4(k)(4)(H) of the BHC Act to acquire or control a company or entity ''engaged in any activity not authorized pursuant to [section 4 of the BHC Act].'' An FHC may not make MBIs in financial companies under section 4(k)(4)(H) or the rule. FHCs have separate authority under other provisions of the BHC Act to make investments in companies engaged in financial activities. However, a company held as an MBI may be engaged in both nonfinancial and financial activities, and an FHC may retain an MBI in a nonfinancial company even if the company subsequently commences a financial activity. An FHC also is not prohibited from using a combination of authorities to invest, through the same subsidiary or fund, in ownership interests of both nonfinancial and financial companies.

Investments in financial companies are not authorized in section 4(k)(4)(H) of the BHC Act. The rule's restrictions, such as those for holding periods and cross-marketing, therefore do not apply to FHC investments in financial companies that are made under other provisions of the BHC Act and the Board's Regulation Y—even if such investments are made for strategic reasons or for reselling the investment. An FHC may not, however, use the merchant banking authority to evade restrictions, such as consent or approval requirements or restrictions that address conflicts of interest or that govern the acquisition of financial companies.[5] In addition, nothing in section 4(k)(4)(H) or the rule overrides the prior-approval requirements of section 3 of the BHC Act, which governs the acquisition of shares of a bank or BHC, or the provisions of section 4(k)(6) and (j) of the BHC Act, which governs the acquisition of shares of a savings association or a company that controls a savings association.

3907.0.2.3 Bona Fide Underwriting or Merchant Banking or Investment Activity

An FHC may only make MBIs as part of a bona fide underwriting or merchant banking or investment banking activity.[6] An FHC is not authorized to make an investment in a nonfinancial company for the purpose of engaging in the activities of the nonfinancial company, such as real estate investment or development or other activities that have not been found to be financial in nature. This ''bona fide'' requirement thus preserves the financial nature of MBI activities and the separation of banking from commerce.

The bona fide requirement does not prohibit an FHC from specializing in making MBIs in particular industries or from making its first MBI in a company engaged in real estate investment or development. However, such investments should be made only for investment as part of an ongoing underwriting or investment or merchant banking activity, and they should be held in accordance with the Board's rules.[7]

3907.0.2.3.1 Investments Made Directly or Through Funds

An FHC may acquire or control MBIs directly or through any subsidiary *other than* a depository institution or subsidiary of a depository institution. An FHC also may *not* acquire or control MBIs on behalf of a depository institution or subsidiary of a depository institution. A

5. See section 4(*l*)(2) of the BHC Act (12 U.S.C. 1843(*l*)(2)) and section 225.84 of Regulation Y (12 C.F.R. 225.84).

6. See section 4(k)(4)(H) of the BHC Act (12 U.S.C. 1843(k)(4)(H)).

7. Concentration in particular industries or in individual investments may present supervisory concerns. The Board expects all FHCs that engage in MBI activities to establish policies governing portfolio diversification and to maintain capital that is adequate, considering the FHC's investment portfolio. See section 3900.0 of this manual and SR-00-9.

U.S. branch or agency of a foreign bank is considered a ''depository institution'' for purposes of the merchant banking rule and its related restrictions. Accordingly, a U.S. branch or agency of a foreign bank may not acquire or control MBIs, and MBIs may *not* be acquired or controlled on behalf of a U.S. branch or agency of a foreign bank.

An FHC is allowed to make MBIs through a private equity fund or other investment fund that, in turn, invests in nonfinancial companies. When an FHC makes such an investment, the holding company's investment in the fund is considered an MBI that must comply with the rule. Certain benefits for investments in or held through a qualifying private equity fund are provided, including an extended holding period and certain relief from the rule's cross-marketing restrictions. Investments in funds that do not qualify as private equity funds are treated as any other type of MBI.

3907.0.2.3.2 Definition of Portfolio Company and Financial Holding Company

Some of the rule's requirements—such as the restrictions on routine management and operation—apply only to portfolio companies. A ''portfolio company'' means any company or entity that is directly or indirectly held, owned, or controlled by an FHC that is using the merchant banking authority, and the company or entity is engaged in an activity that is not authorized for the FHC under section 4 of the BHC Act. (See section 225.177 of Regulation Y.)

The term ''financial holding company,'' as used in the rule, refers to the FHC and any direct or indirect subsidiary of the holding company (including a private equity fund or other fund controlled by the FHC). The term does not include—

1. a portfolio company that is controlled by the FHC or
2. any depository institution controlled by the FHC or any subsidiary of such a depository institution, unless otherwise provided in the rule.

3907.0.3 LIMITS ON MANAGING OR OPERATING A PORTFOLIO COMPANY HELD AS A MERCHANT BANKING INVESTMENT

The GLB Act prohibits an FHC from routinely managing or operating a portfolio company, except as may be necessary or required to obtain a reasonable return on the resale or disposition of the investment. (See section 225.171 of Regulation Y.)

3907.0.3.1 Relationships That Involve Routine Management or Operation

An FHC routinely manages or operates a portfolio company if any director, officer, or employee of the FHC serves as or has the responsibilities of an executive officer of the portfolio company. The term ''executive officer'' has the same meaning as used in the Board's Regulation O. This definition includes any person who participates or has the authority to participate (other than in the capacity of a director) in major policymaking functions of the portfolio company, whether or not the officer has an official title, the title designates the officer as an assistant, or the officer serves without salary or other compensation.[8] (See section 225.177(d) of Regulation Y and 12 C.F.R. 215.2(e)(1).) An FHC is also considered to routinely manage or operate a portfolio company if an executive officer of the parent FHC or certain of its major subsidiaries serves as (or has the responsibilities of) an officer or employee of the portfolio company. For the purposes of these restrictions, an FHC's major subsidiaries include any subsidiary that is (1) a depository institution, (2) an SEC-registered broker-dealer, (3) engaged in MBI activities or insurance company investment activities under section 4(k)(4)(H) or (I) of the BHC Act, (4) a small business investment company, or (5) engaged in significant equity investment activities that are subject to a special capital charge under the Board's capital guidelines (for example, a company engaged in investment activities under section 4(c)(6) or (7) of the BHC Act). An FHC also is considered to routinely manage or operate a portfolio company if

8. An executive officer does not include a person who may exercise a certain measure of discretion in the performance of his or her duties, including the discretion to make decisions in the ordinary course of business, but who does not participate in the determination of major policies of the company and whose decisions are limited by policy standards fixed by senior management. In addition, the term does not include any person who is excluded from participating (other than in the capacity of a director) in major policymaking functions of the company by resolution of the board of directors or by the bylaws of the company, provided the person does not in fact participate in such policymaking functions.

it restricts, by covenants, agreements, or otherwise, the portfolio company's ability to make routine business decisions. Covenants or agreements that involve routine business decisions include covenants that restrict the portfolio company's ability to enter into transactions in the ordinary course of business or to hire nonexecutive officers or employees. As described below, an FHC may have covenants and agreements that restrict actions that are outside the ordinary course of business.

In addition, an FHC is presumed to be involved in the day-to-day management or operations of a portfolio company if a director, officer, or employee of the FHC serves as a nonexecutive officer or employee of the portfolio company or if an officer or employee of the portfolio company is supervised by or reports to an officer or employee of the FHC. An FHC may rebut this presumption by presenting specific facts demonstrating that the junior-officer or employee interlock with the portfolio company would not involve the investing FHC in the routine management and operating of the company.[9] Any request to rebut a presumption must be made to the Board and should fully describe all the facts and circumstances related to the FHC's investment in and relationships with the portfolio company.

3907.0.3.2 Relationships That Do Not Constitute Routine Management or Operation

The rule identifies several relationships that an FHC may have with a portfolio company that would *not* involve the FHC in routinely managing or operating the portfolio company.[10] The following relationships allow the FHC to monitor and provide strategic and financial advice to a portfolio company without becoming involved in the day-to-day management or operations of the company:

1. *Director interlocks.* An FHC may have one or more representatives on the board of directors of a portfolio company. The Board considers the selection of the partners (including the general partner) of a partnership to be the equivalent of selecting the directors of a company. An FHC representative who serves as a director of a portfolio company may participate fully in those matters that are typically presented to directors of a company, whether the director participates in these matters at a meeting of the board, at meetings of committees of the board, through written votes, through meetings with officers or employees of the portfolio company, or in other ways. The FHC's director representatives, however, may not participate in the day-to-day operations of the portfolio company or in management decisions that are made in the ordinary course of business and that are not customarily presented to the directors of a company. The portfolio company also must have officers and employees that routinely manage and operate the company, and the FHC must not have other arrangements or relationships with the portfolio company that would involve the FHC in the routine management or operation of the portfolio company.
2. *Covenants concerning actions outside the ordinary course of business.* An FHC may restrict, by covenant or otherwise, the ability of a portfolio company to take actions that are outside the ordinary course of business. Some examples of actions that are outside the ordinary course of business and that may be subject to these types of covenants or agreements are—
   a. the acquisition of significant assets or control of another company by the portfolio company or any of its subsidiaries;
   b. the removal or selection of the portfolio company's independent accountant or investment banker;
   c. significant changes to the portfolio company's business plan or accounting methods or policies;
   d. the removal or replacement of any or all of the executive officers of the portfolio company;
   e. the redemption, authorization, or issuance of any equity or debt securities of the portfolio company;
   f. any borrowing by the portfolio company that is outside the ordinary course of business;
   g. the amendment of the portfolio company's articles of incorporation, bylaws, or similar governing documents; and
   h. the sale, merger, consolidation, spin-off, recapitalization, liquidation, dissolution, or sale of substantially all of the assets of the portfolio company or any of its significant subsidiaries.

9. See section 225.171(c) of Regulation Y (12 C.F.R. 225.171(c)).
10. See section 225.171(d) of Regulation Y (12 C.F.R. 225.171(d)).

3. *Providing advisory and underwriting services to and consulting with a portfolio company.* An FHC also may provide financial, investment, or management consulting advisory services to the portfolio company in accordance with applicable limitations under Regulation Y.[11] Any management consulting services provided to a portfolio company must remain solely advisory, and the FHC may not assume responsibility for decision making or for the day-to-day management or operations of the portfolio company.[12] An FHC may also underwrite or act as placement agent for the securities of a portfolio company and provide assistance to the portfolio company in connection with the underwriting or placement of its securities without being considered to be involved in routinely managing or operating the company. An FHC also may have regular or periodic meetings with the officers or employees of a portfolio company to monitor and provide advice regarding the portfolio company's performance or activities, so long as the FHC, through such meetings or otherwise, does not routinely manage or operate the portfolio company.

3907.0.3.2.1 Other Permissible Covenants Not Involving the FHC in Routinely Managing and Operating a Portfolio Company

Listed below are some additional examples of covenants that an FHC may have with a portfolio company without routinely managing or operating the portfolio company.[12a] In particular, an FHC may, consistent with the GLB Act and section 225.171(d) of Regulation Y, have covenants with a portfolio company that restrict the ability of the portfolio company to—

1. alter its capital structure through the issuance, redemption, authorization, or sale of any equity or debt securities of the portfolio company;[12b]
2. establish the general purpose for funds sought to be raised through the issuance or sale of any equity or debt securities of the portfolio company (for example, retirement of existing debt, acquisition of another company, or general corporate use);
3. amend the terms of any equity or debt securities issued by the company;
4. declare a dividend on any class of securities of the portfolio company or change the dividend-payment rate on any class of securities of the portfolio company;
5. engage in a public offering of securities of the portfolio company;
6. register a class of securities of the portfolio company under federal or state securities laws;
7. list (or de-list) any securities of the portfolio company on a securities exchange;
8. create, incur, assume, guarantee, refinance, or prepay any indebtedness outside the ordinary course of business of the portfolio company;
9. voluntarily file for bankruptcy, or consent to the appointment of a receiver, liquidator, assignee, custodian, or trustee of the portfolio company for purposes of winding up its affairs;
10. significantly alter the regulatory, tax, or liability status of the portfolio company (examples of actions that would significantly alter the regulatory, tax, or liability status of the portfolio company include the registration of the portfolio company as an investment company under the Investment Company Act of 1940, or the conversion of the portfolio company from a corporation to a partnership or limited-liability company);
11. make, or commit to make, any capital expenditure that is outside the ordinary course of business of the portfolio company, such as the purchase or lease of a significant manufacturing facility, an office building, an asset, or another company;
12. engage in, or commit to engage in, any purchase, sale, lease, transfer, or other transaction outside the ordinary course of business of the portfolio company, which may include for example—
    a. entering into a contractual arrangement (including a property lease or consulting agreement) that imposes significant financial obligations on the portfolio company;
    b. the sale of a significant asset of the portfolio company (for example, a signifi-

11. See sections 225.28(b)(6) and 225.86(b)(1) of Regulation Y (12 C.F.R. 225.28(b)(6) and 12 C.F.R. 225.86(b)(1)).

12. See sections 225.28(b)(9) and 225.86(b)(1) of Regulation Y (12 C.F.R. 225.28(b)(9) and 12 C.F.R. 225.86(b)(1)).

12a. See letter from Virgil Mattingly, the Federal Reserve Board's general counsel, to Peter T. Grauer, Credit Suisse First Boston, dated December 21, 2001.

12b. For these purposes, the phrase ''equity and debt securities'' includes options, warrants, obligations, or other instruments that give the holder the right to acquire securities of the portfolio company.

cant patent, manufacturing facility, or parcel of real estate);

c. the establishment of a significant new subsidiary by the portfolio company;
d. the transfer by the portfolio company of significant assets to a subsidiary or to a person affiliated with the portfolio company; or
e. the establishment by the portfolio company of a significant new joint venture with a third party;

13. hire, remove, or replace any or all of the executive officers of the portfolio company;[12c]
14. establish, accept, or modify the terms of an employment agreement with an executive officer of the portfolio company, including the terms setting forth the executive officer's salary, compensation, and severance;
15. adopt or significantly modify the portfolio company's policies or budget concerning the salary, compensation, or employment of the officers or employees of the portfolio company generally;
16. adopt or significantly modify any benefit plan covering officers or employees of the portfolio company, including defined benefit and defined contribution retirement plans, stock option plans, profit sharing, employee stock ownership plans, or stock appreciation rights plans;
17. alter significantly the business strategy or operations of the portfolio company, for example, by entering or discontinuing a significant line of business or by altering significantly the tax, cash-management, dividend, or hedging policies of the portfolio company; or
18. establish, dissolve, or materially alter the duties of a committee of the board of directors of the portfolio company.

Some of the above actions by their very nature are outside the ordinary course of business of a portfolio company and, thus, may be subject to a covenant with the portfolio company. For example, covenants restricting the ability of a portfolio company to issue or redeem its equity or debt securities or hire or fire its executive officers are unusual actions that typically are taken only by or in consultation with the company's board of directors.

12c. The term ''executive officer'' is defined in section 225.171 of Regulation Y.

Covenants concerning other types of actions may, or may not, involve the FHC in routine business decisions of the portfolio company, depending on the specific scope of actions covered by the covenant and the size and characteristics of the portfolio company. To provide FHCs maximum flexibility in structuring their relationships with portfolio companies to the extent permitted by the GLB Act, several of the examples included above permit an FHC to restrict the ability of a portfolio company to take certain actions whenever the actions are significant.

The measure of ''significant'' in this context would depend on the size, capital, condition, business, and other characteristics of the portfolio company. In determining what is significant for a particular portfolio company, one rule of thumb is that any action that would, under ordinary business practices, be presented to the board of directors of the portfolio company for approval or consideration may also be subject to a covenant that requires review and approval of the action by the financial holding company investor. In this way, the rule permits a financial holding company investor to exercise the same type of review and approval rights through a covenant that the FHC could exercise directly through representation on the board of directors of the portfolio company. As with a director representative, however, an FHC may not use a covenant as a means to become involved in routine business decisions made in the ordinary course of the portfolio company's day-to-day business activities.

There also may be situations in which a covenant is permissible even though the actions involved are ones that, under ordinary business practices, would not be considered by the board of directors of the portfolio company. It is expected that these situations would be unusual and the permissibility of such a covenant would likely depend on the particular facts and circumstances involved in the case.

3907.0.3.2.2 FHC May Routinely Manage or Operate a Portfolio Company in Special Circumstances

An FHC may routinely manage or operate a portfolio company only when such action is ''necessary or required to obtain a reasonable return on [the] investment upon resale or disposition.'' Examples of situations in which intervention may be needed would be when the portfolio company experiences a significant operating loss or when there is a loss of senior management. Once the FHC has taken appropriate action to obtain a reasonable return on the resale or disposition of the investment, the GLB Act requires the FHC to cease routinely managing or operating the portfolio company. The FHC may routinely manage or operate a portfolio company only for the period of time that may be necessary to address the cause of the holding company's involvement in the routine management or operations of the portfolio company, to obtain suitable management arrangements, to dispose of the investment, or to otherwise obtain a reasonable return on the resale or disposition of the investment. The determination of whether and how long FHC intervention is necessary or required will depend on the facts and circumstances of the particular investment.

Two requirements in the rule assist the Federal Reserve in monitoring the interventions of FHCs in the routine management or operations of portfolio companies. These requirements ensure that such actions are consistent with the GLB Act's limitations. First, FHCs are required to maintain and make available to the Board on request a written record describing the company's involvement in routinely managing or operating any portfolio company.[13] Second, an FHC is required to provide the Board with written notice if the company routinely manages or operates a portfolio company for more than nine months.[14] The notice may be in the form of a letter and should identify the portfolio company, the date on which the FHC first became involved in the routine management or operations of the portfolio company, the reasons for the involvement, and the actions that the FHC has taken to address the circumstances giving rise to the intervention, as well as provide an estimate of when the FHC anticipates it will cease routinely managing or operating the portfolio company.

3907.0.3.3 Depository Institutions Prohibited from Managing or Operating Portfolio Companies

A depository institution or a subsidiary of a depository institution may not routinely manage or operate a portfolio company held by an FHC. As noted above, U.S. branches and agencies of foreign banks are considered depository institutions for purposes of the rule. A director, officer, or employee of a depository institution or its subsidiary, as well as a U.S. branch or agency, however, is not prohibited from serving as a director of a portfolio company to the same extent as would be permitted for a director, officer, or employee of an FHC. Such director, officer, or employee is also not prohibited from taking other actions that the rule does not define to be routine management or operation. In addition, a depository institution is not prevented from having covenants or from taking actions pursuant to covenants that are typically found in credit agreements to ensure repayment of extensions of credit in the ordinary course of business, provided the covenant or action is not an attempt to evade the rule's restrictions.

The rule also does not apply the prohibition on a depository institution routinely managing or operating a portfolio company to a financial subsidiary of a bank that is held in accordance with section 5136A of the Revised Statutes (12 U.S.C. 24a) or section 46 of the Federal Deposit Insurance Act (FDI Act). The prohibition also does not apply to a small business investment company subsidiary of a bank held in accordance with the Small Business Investment Act of 1958. These subsidiaries may, however, exercise routine management or operation only in accordance with the limitations that apply to FHCs.

3907.0.4 HOLDING PERIODS FOR MERCHANT BANKING INVESTMENTS

The GLB Act requires that any shares, assets, and ownership interests acquired as an MBI be held only for a period of time that enables the sale or disposition of the interest on a reasonable basis, consistent with the financial viability of the FHC's merchant banking activity. The rule permits an FHC to hold any MBI for a period of up to 10 years. In addition, the rule allows an FHC to own or control an MBI in or through a private equity fund (as defined below) for the life of the fund, up to 15 years.[15]

An FHC may hold an MBI beyond the rule's specified time periods only with the Board's prior approval. A request by an FHC for an extension of the applicable holding period must be filed at least 90 days before the expiration of the holding period. An extension request must provide the reasons for the request (including

13. See section 225.171(e)(4) of Regulation Y (12 C.F.R. 225.171(e)(4)).

14. See section 225.171(e)(3) of Regulation Y (12 C.F.R. 225.171(e)(3)).

15. See section 225.172 of Regulation Y (12 C.F.R. 225.172).

the factors listed below), explain the FHC's plan for divesting the investment, and discuss the factors that the Board may consider in reviewing the request. Factors to be included in the extension request are the cost to the FHC of disposing of the investment within the applicable time period, the total exposure of the FHC to the portfolio company and the risks that disposing of the investment without an extension may pose to the FHC, market conditions, the nature of the portfolio company's business, the extent and history of the FHC's involvement in the management and operations of the portfolio company, and the average holding period of the FHC's MBIs. The Board may also consider any other relevant information related to the investment.

If an FHC receives permission to hold an MBI beyond the applicable holding period, a special capital charge applies to the investment. The Board must set this charge at a rate that is above the highest marginal tier 1 capital charge applicable under the Board's capital guidelines for MBIs held by that FHC, but the rate may not be below 25 percent of the adjusted carrying value of the investment as reflected on the FHC's balance sheet. The Board may also impose other restrictions it determines to be appropriate in connection with granting the extension request.

3907.0.4.1 Holding-Period Tacking Provisions

The rule includes special "tacking" provisions to prevent an FHC from circumventing the holding periods on MBIs by transferring an MBI from one company or fund to another.[16] The rule also provides that, for purposes of calculating compliance with the merchant banking holding periods, an investment the FHC acquires under another authority that imposes a restriction on the amount of time that the FHC may hold the investment is considered to have been acquired on the original acquisition date.

3907.0.5 PRIVATE EQUITY FUNDS

As noted above, the rule permits an FHC to make MBIs directly or through funds that pool the firm's capital with capital provided by third-party investors, such as investment companies, pension funds, endowments, financial institutions or corporations, and sophisticated individual investors who have a high net worth. Frequently, these pooled investment vehicles have characteristics (such as limited terms, manager-compensation arrangements, and the presence of third-party investors that monitor investments) that encourage the fund to dispose of its investments in a relatively short period of time. Considering such characteristics, and to

16. See section 225.172(b)(2) and (3) of Regulation Y (12 C.F.R. 225.172(b)(2) and (3)).

accommodate industry practice on investment funds, the rule includes several special provisions for MBI activities conducted through a qualifying "private equity fund." The provisions include a longer holding period for private equity fund investments, a higher aggregate investment threshold for review of an organization that makes investments in or through private equity funds, and streamlined reporting and recordkeeping provisions for investments in or held through private equity funds.

3907.0.5.1 Definition of Private Equity Fund

To qualify as a "private equity fund" under the rule, the fund must have a fixed duration of not more than 15 years including all potential extensions, and the FHC (including its officers, directors, employees, and principal shareholders) may not own more than 25 percent of the total equity of the fund. There are no limits on advisory fees or on the various types of incentive compensation that the FHC may receive for services rendered to the fund, provided such fees do not increase the FHC's equity stake in the fund above the 25 percent threshold.

A private equity fund also may not be an operating company and must be engaged exclusively in the business of investing in financial and nonfinancial companies for resale or other disposition. In addition, the fund may not be established or operated for the purpose of making investments that are inconsistent with section 4(k)(4)(H) of the BHC Act or evading the limitations of the GLB Act or the rule.

A private equity fund can be organized in any form, including a partnership, corporation, or limited-liability company. In addition, the fund may, but need not be, registered as an investment company under the federal securities laws.

3907.0.5.2 Permissible Holding Period for Private Equity Fund Investments

As noted above, an FHC, without Board approval, may own or control an investment in a private equity fund that makes MBIs for the duration of the fund, which may be up to 15 years. A qualifying private equity fund may therefore hold investments in portfolio companies for up to 15 years, and it is not required to dispose of its investments within the 10-year period applicable to other types of MBIs. In special circumstances, an FHC may seek the Board's approval to retain an investment in a qualifying private equity fund or to extend the duration of a private equity fund for a period longer than 15 years.[17] (See section 3907.0.5 of this manual for a discussion of how an FHC may request an extension of this holding period.)

3907.0.5.3 Routine Management and Operation Restrictions for Private Equity Funds

The GLB Act and the rule generally prohibit an FHC from routinely managing or operating any portfolio company—that is, any company engaged in nonfinancial activities.[18] These restrictions apply regardless of whether the FHC owns or controls its interest in the portfolio company directly or through a private equity fund. Accordingly, an FHC may not routinely manage or operate a portfolio company that is owned or controlled by a private equity fund in which the FHC owns or controls any ownership interest, except in the limited circumstances permitted by the rule.[19] In addition, if an FHC controls a private equity fund, the private equity fund is a subsidiary of the FHC and the *private equity fund* must abide by the rule's limits on routine management and operation of portfolio companies. An FHC, however, is not prohibited from routinely managing or operating the private equity fund itself.

An FHC is considered to control a private equity fund for the purpose of the rule if the FHC or any director, officer, employee or principal shareholder of the company (1) serves as a general partner, managing member, or trustee of the private equity fund; (2) owns or controls in the aggregate 25 percent or more of any class of voting shares or similar interests in the fund; (3) selects, controls, or constitutes a majority of the directors, trustees, or management of the fund; or (4) owns or controls more than 5 percent of any class of voting shares or similar ownership interests in the fund and serves as the fund's investment adviser.

17. The holding-period tacking rules in section 225.172(b)(2) and (3) of Regulation Y must be applied when a private equity fund investment has been held longer than the permitted time.

18. See sections 225.177(c) and 225.171(a) of Regulation Y (12 C.F.R. 225.177(c) and 225.171(a)).

19. See section 225.171(e) of Regulation Y (12 C.F.R. 225.171(e)).

3907.0.5.4 Other Matters Related to Private Equity Funds

When an FHC has a passive (that is, noncontrolling) investment in a private equity fund that is advised and controlled by an unaffiliated entity, any shares owned by the fund generally are not considered to be owned or controlled by the passive FHC investor.[20] Therefore, the rule's cross-marketing restrictions on the products or services of a portfolio company, the limitations of sections 23A and 23B of the FRA, and the rule's reporting and recordkeeping requirements *do not apply* to investments in portfolio companies that are held by a private equity fund and that are not controlled by the FHC. These restrictions and requirements (other than the cross-marketing restrictions) would, however, apply to the FHC's investment in the private equity fund and would govern the relationship of the FHC with the private equity fund.

3907.0.5.4.1 Funds That Are Not Qualifying Private Equity Funds

An FHC is permitted to invest in and control a fund that does not meet the private equity fund definition. If the FHC controls the nonqualifying fund, then the provisions of the rule, including the holding-period provisions for portfolio companies, the routine-management restrictions, the risk-management and recordkeeping requirements, the cross-marketing provisions, and the section 23A provisions, apply to investments made by the nonqualifying fund in the same manner as those provisions would apply if the investment in the portfolio company were held directly by the FHC. If the FHC owns a noncontrolling interest in the fund, then the fund is itself considered to be a portfolio company.

An FHC may thus own more than 25 percent of the equity of a fund that has an unlimited life (and, consequently, is not a qualifying private equity fund), so long as the fund does not hold investments in portfolio companies for more than 10 years, and the FHC and the fund comply with the routine management and other restrictions of the rule. Similarly, an FHC may invest in a fund that, in addition to making MBIs, engages in other businesses (and, consequently, is not a qualifying private equity fund), so long as the FHC does not control the fund, divests its interest in the fund within 10 years, and complies with the other provisions of the rule that apply to investments in a portfolio company.

20. See section 2(g)(1) of the BHC Act (12 U.S.C. 1841(g)(1)) and section 225.2(e)(2)(i) of Regulation Y (12 C.F.R. 225.2(e)(2)(i)).

3907.0.6 TEMPORARY AGGREGATE INVESTMENT THRESHOLDS FOR MBIs

To allow the Federal Reserve to review the risk-management policies, procedures, and systems of an FHC that seeks to devote a significant portion of its capital to MBIs, temporary investment thresholds on MBIs are included in the rule. An FHC may not, without the Board's prior approval, make additional MBIs if the aggregate carrying value of its existing MBIs exceeds either of the two thresholds. The first threshold prevents an FHC from making additional MBIs (including making additional capital contributions to a company held under the rule) if the aggregate carrying value of the FHC's MBIs exceeds 30 percent of the FHC's tier 1 capital. A second threshold applies if the aggregate carrying value of the FHC's MBIs, *excluding* investments in private equity funds, exceeds 20 percent of the FHC's tier 1 capital. An FHC may exceed either threshold with the prior approval of the Board.

The investment thresholds were adopted as sunset provisions until the Board adopts a final rule specifically addressing the regulatory capital treatment for MBIs and that rule becomes effective. In February 2001, the Board, the Office of the Comptroller of the Currency, and the Federal Deposit Insurance Corporation jointly requested comment on proposed rules that would establish special capital requirements for MBIs and similar equity investments held by BHCs and banks. (See 66 *Federal Register* 10, 212 (February 14, 2001).)

The investment thresholds discussed above apply only to MBIs made by FHCs under section 4(k)(4)(H) of the BHC Act and under the rule. They do not apply to or restrict investments made by BHCs or FHCs under other authorities, such as investments made through small business investment companies (SBICs), investments made in less than 5 percent of the voting shares of a company under section 4(c)(6) or (7) of the BHC Act, or investments made overseas under Regulation K.

3907.0.7 RISK-MANAGEMENT, REPORTING, AND RECORDKEEPING POLICIES

3907.0.7.1 Policies, Procedures, Systems, and Reports

An FHC must maintain policies, procedures, and systems that are reasonably designed to manage the risks associated with making MBIs and to monitor compliance with the statutory and regulatory provisions governing such investments. The rule identifies the major areas that must be addressed by the internal policies and controls of an FHC engaged in making MBIs. In particular, an FHC engaged in merchant banking activities must have policies, procedures, records, and systems that are reasonably designed to—

1. monitor and assess the carrying value, market value, and performance of MBIs and of the company's aggregate MBI portfolio;
2. identify and manage the market, credit, concentration, and other risks associated with MBIs;
3. identify, monitor, and assess the terms, amounts, and risks arising from transactions and relationships (including contingent fees or contingent interests) with each company in which the FHC has an MBI;
4. ensure the maintenance of corporate separateness between the FHC and each company in which the FHC holds an interest under the rule, and protect the FHC and its depository institution subsidiaries from legal liability for the operations conducted and financial obligations of any such company; and
5. ensure compliance with the rule, including the rule's holding-period, routine management and operation, and cross-marketing restrictions, as well as with any other applicable provisions of law governing transactions and relationships with companies in which the FHC holds an interest under the rule, such as fiduciary principles and sections 23A and 23B of the FRA.

This list of policies, procedures, records, and systems identifies only some of the most important elements of a sound approach to monitoring MBI activities. The Board has issued supervisory guidance (see SR-00-9) that provides additional detail concerning the internal controls, policies, and systems that any BHC engaged in equity investment activities is expected to have and maintain to engage in such activities in a safe and sound manner. (See section 3900.0 of this manual for more detail on this guidance.)

If the FHC controls a private equity fund or other fund that makes MBIs, the FHC must ensure that the fund has the types of policies, procedures, and systems for making and monitoring MBIs that are required for FHCs. The FHC may satisfy these requirements by ensuring that the private equity fund or other fund is subject to the FHC's merchant banking policies, procedures, and systems. If an FHC does not control the fund, then the fund is not subject to the recordkeeping and risk-management provisions of the rule. Nevertheless, an FHC must apply its merchant banking policies, procedures, and systems to any investment made by the company in any fund that is controlled by an unaffiliated entity.

It is anticipated that FHCs will be able to satisfy the rule's recordkeeping requirements by using the internal reports and records it prepares in the ordinary course of making an MBI or controlling a private equity fund. Similarly, if an FHC makes a noncontrolling investment in a private equity fund, the FHC should be able to use information provided by the fund's adviser or sponsor to satisfy the rule's recordkeeping requirements.

3907.0.7.2 Notice of Commencement of Merchant Banking Activities

An FHC must notify the Board within 30 days of commencing merchant banking activities under section 4(k)(4)(H) of the BHC Act. (See section 225.87(a) of Regulation Y.) For a domestic FHC, this notice should be provided on the Federal Reserve's reporting form, the FR Y-6A (which is expected to be replaced by the FR Y-10). For qualifying foreign banking organizations, the notice should be provided on the FR Y-7 (which is expected to be replaced by the FR Y-10F).

The appropriate Reserve Bank, in coordination with Board staff, should schedule a review of the investment and risk-management policies, procedures, and systems of an FHC that files a notification indicating that it has commenced merchant banking activities. The review may be conducted either off- or on-site, depending on the expected level and complexity of the FHC's MBIs and the company's previous experience in making equity investments under other legal authorities. This review may be deferred until the next regularly scheduled inspection or examination, if the FHC has significant experience in making equity investments under preexisting authorities and if the Federal Reserve has recently reviewed the company's policies, procedures, and systems for managing and controlling the risks associated with equity investment activities.

3907.0.7.3 Quarterly and Annual Reporting Requirements

The Federal Reserve has instituted two periodic reporting requirements relating to MBIs. The first is a quarterly report (FR Y-12) that seeks aggregate information on the cost and carrying values of an FHC's MBIs. This report also collects information on nonfinancial equity investments made by BHCs and their subsidiaries under other legal authorities, including investments made through SBICs and investments made in less than 5 percent of the voting shares of a company under section 4(c)(6) or (7) of the BHC Act. This quarterly report assists the Federal Reserve in monitoring the exposure of BHCs to MBIs and similar types of equity investments. The second report is an annual report, the FR Y-12A, that will collect basic information on MBIs held by an FHC for an extended time period. The FR Y-12A annual report collects information on MBIs that are approaching the end of their applicable holding period.

3907.0.7.4 Notice of Large Merchant Banking Acquisitions

After an FHC has provided notice to the Federal Reserve that it has commenced merchant banking activities, the FHC generally is *not* required to file a notice after acquiring the shares of a company under its merchant banking investment authority. However, an FHC must file a post-transaction notice with the Federal Reserve within 30 days after making an MBI in a company if (1) the investment represents more than 5 percent of the voting shares, assets, or ownership interests of the company, and (2) the total cost of the investment to the FHC exceeds the lesser of 5 percent of the tier 1 capital of the FHC or $200 million. This notice must be provided on the forms discussed above.

3907.0.8 CROSS-MARKETING RESTRICTIONS

The GLB Act prohibits a depository institution subsidiary of an FHC from marketing or offering any product or service of a company in which the FHC has an MBI. Similarly, the GLB Act prohibits a company held by an FHC as an MBI from marketing or offering any product or service of a depository institution subsidiary of the FHC. U.S. branches and agencies of a foreign bank that conduct BHC activities in the United States or through a U.S. company are considered depository institutions under the rule. Thus, a U.S. branch or agency of a foreign bank may not cross-market the products or services of a company that is owned or controlled by the foreign bank or an affiliate of the foreign bank under section 4(k)(4)(H) of the BHC Act. In addition, the cross-marketing restrictions generally apply to any *subsidiary* of a depository institution controlled by an FHC.

The cross-marketing restrictions, however, do not apply to certain subsidiaries of a depository institution that Congress has expressly authorized the parent institution to own or control. In particular, the cross-marketing restrictions do *not* apply to (1) a financial subsidiary of a depository institution held in accordance with section 5136A of the Revised Statutes (12 U.S.C. 24a) or section 46 of the FDI Act, (2) any company held by an Edge Act or agreement subsidiary of the depository institution that is controlled pursuant to section 25 or 25A of the FRA, or (3) any company held by an SBIC subsidiary of the depository institution that is controlled in accordance with the Small Business Investment Act.

The cross-marketing restrictions of the GLB Act and the rule also do *not* apply to nondepository affiliates of FHCs. Accordingly, a nondepository holding company affiliate of an FHC may engage in cross-marketing activities with a portfolio company held by the FHC under section 4(k)(4)(H) of the BHC Act. In addition, these restrictions do not apply to (1) portfolio companies in which the FHC, either directly or indirectly, owns less than 5 percent of the voting shares or ownership interests; (2) portfolio companies that are held by a private equity fund the FHC does not control; and (3) interests in a private equity fund (whether or not the FHC controls the fund). Accordingly, a depository institution subsidiary of an FHC may engage in cross-marketing activities with such a company, or it may market the shares of a private equity fund.
